The Thracian Chersonese, now known as the Gallipoli (Gelibolu) peninsula in modern Turkey, is a long, narrow peninsula forming the European side of the Hellespont (Dardanelles) and connecting the Sea of Marmara with the Aegean. It was always important as a wheat-exporting region, but even more because of its strategic location as a crossing point between Europe and Asia; before long, this attracted Greek colonization, mainly by Aeolians from Lesbos and Ionian Greeks from Miletus as early as the end of the 8th and the beginning of the 7th century BC. Attic black-figure vases started to reach the area from 600 BC, showing an Athenian interest in it that was to continue for centuries: probably already in the 6th century the Chersonese was a strategic point on the route along which grain imports vital for Athens moved (by the 4th century Athens imported about half of the grain it needed from the Black Sea region). The Athenian aristocrat Miltiades the Elder established a domain of his own and built a defensive wall across the Bulair isthmus to protect it against the native Thracians; the Chersonese remained his family's property until his nephew Miltiades the Younger abandoned it to Darius I of Persia (*c.*492 BC). According to the account given by Herodotus (6. 34–40, 6. 103f.), the Chersonese was originally held by the Thracian Dolonci, who consulted the Delphic oracle when they were attacked by another tribe, and then invited Miltiades to protect them. Miltiades died childless, and in about 516 BC the sons of the Athenian tyrant Pisistratus sent Miltiades the Younger to take control of the region. He established himself by maintaining an army of 500 mercenaries and married the daughter of the Thracian king Olorus, who became his ally. He fled back to Athens, however, before the Persian advance, and for the next 30 years the Chersonese was under Persian control.

After the Persian withdrawal from the Greek mainland in 479, Athens quickly moved to regain control of the Chersonese – conquering the strategically important Sestus – to ensure the safe passage of Black Sea grain; the Chersonese became a part of the Delian League. Moreover, the sending of colonists there was an outlet for surplus population (among the Athenian settlements known as cleruchies founded about the middle of the 5th century BC there is a dispatch of 1000 cleruchs to the Chersonese). After the Peloponnesian War (431–404) Sparta briefly controlled the area, but it reverted to the control of Athens, who once more sent settlers there in 353 and cruelly punished recalcitrant Sestus. In 338 Athens finally ceded the area to Philip II of Macedonia; later it became part of the Seleucid empire. In 188 BC the Romans gave the Chersonese to the Attalid Eumenes II of Pergamum; it became Roman in 133 BC. Under Augustus it was turned into an emperor's estate.

Since the beginning of Greek colonization, a number of Greek towns developed on the Chersonese. Of the lesser ones (Alopeconnesus, an Aeolian foundation; Crithote, founded by the elder Miltiades and in ruins in Roman times) not much is known; more importance – varying over time – was attained by Sestus, Cardia, Elaious, and (since Hellenistic times) Lysimacheia and Callipolis (which gave the peninsula its modern name).

Sestus was situated at the narrowest part of the Hellespont (just opposite Abydus) and therefore provided the best point of departure to and from Asia; originally a Thracian settlement and mentioned already in Homer's catalogue of the Trojan army (*Iliad*, 2. 836), it was colonized by the Lesbians in about 600 BC. In 480 BC Xerxes built his naval bridge there, and in 334 BC Alexander the Great crossed from there over to Asia. In 365 BC Sestus was held by the Persian satrap Ariobarzanes; in 360 BC the Thracians conquered the city. Under Attalid rule, Sestus seems to have retained a certain autonomy and minted its own coins; this stopped only in AD 250, when the city fell into decay. In the 6th century AD Justinian erected a fortress above the remains, and the place again had some importance in the fighting between the Latin emperors based in Constantinople and the Byzantine emperors at Nicaea in the early 13th century. As the Chersonese has not yet been much explored archaeologically (access to this military area of modern Turkey is restricted), the precise location of Sestus remains unknown.

Cardia, founded by the Milesians and occupied by the elder Miltiades and his colonists in 560 BC, had a strategic location on the west coast of the Chersonese where it opened up into mainland Thrace. In the Peloponnesian War Cardia was an Athenian naval base. Lysimachus destroyed it in 309 BC to incorporate its inhabitants into the newly founded Lysimacheia.

Elaious, situated at the southern tip of the Chersonese and dominating its entrance, was probably also an Athenian foundation and used by Miltiades as a harbour; it was famous because of its ancient sanctuary of Protesilaus (perhaps identical with the prehistoric tumulus of Eski Hisarlâk), which was pillaged by the Persian Artayctes, but apparently continued to exist until late antiquity; Alexander the Great sacrificed at Protesilaus' tomb before crossing over to Troy. Elaious served as an Athenian naval base in the Peloponnesian War and was a member of the Second Delian League from 375 BC; when the

Chersonese became the property of the Thracian king Cotys I, Elaious together with Crithote (see above) remained with Athens. Elaious still played a role in the battles between Constantine the Great and Licinius in AD 323 and was, like Sestus, refortified by Justinian.

Lysimacheia was founded at the northern end of Chersonese (near Cardia) in 309 BC by Lysimachus, who intended it to be his capital. After his death in 281 the city passed through several hands and was finally destroyed by the Thracian king Diegylis in 144 BC.

Callipolis, mentioned by sources only since the 3rd century BC (it was conquered in 209 BC by Philip V of Macedon), acquired greater importance in later antiquity when Byzantium became capital of the eastern empire. In 1354 or 1357 the city was the first place in Europe to be conquered by the Turks; it remained strategically important as a naval base for the defence of Istanbul. The modern town of Gallipoli was heavily damaged by an earthquake in 1912 and shortly afterwards suffered severe destruction during the fierce fighting of the Gallipoli campaign of World War I, in which determined Turkish resistance caused the invading Allies heavy losses. Today Gelibolu, a Turkish town of 14,500 inhabitants, is a commercial centre, fishing port, and marine base.

BALBINA BÄBLER

Summary

A long narrow peninsula, forming the European side of the Hellespont, the Thracian Chersonese was important in antiquity because of its fertility and its strategic location as a crossing point between Europe and Asia, and between the Black Sea and the Mediterranean.

Chersonesus

City in the Crimea

Chersonesus was a Greek colony in the southwest of the Crimea peninsula (near the modern city of Sevastopol). Throughout antiquity it had an important strategic position: whoever held the city had control over the northwest section of the Black Sea, i.e. the Danube delta and the entrance to the great northern gulf which receives the waters of the Dniestr, Bug, and Dniepr.

Until recently it was commonly agreed that Chersonesus was a Dorian colony, founded by Heraclea Pontica together with Delos in the later 5th century BC and that there had probably been an earlier, small Ionian emporium. New excavations, however, have brought to light Ionian and Attic black-figure vases and terracottas of the last quarter of the 6th century BC as well as a series of spectacular ostraca of the entire 5th century, showing that the colonists had the Milesian alphabet, but used chiefly Dorian names. This new evidence proves that already in the last quarter of the 6th century BC not only Heracleots but also Ionians from the south shore of the Pontus took part in the foundation of the polis. This earlier dating was confirmed when in 1986 an intact stratum of the Archaic period (containing the traces of a sanctuary of the end of the 6th century) was found in the northeast part of the city.

Chersonesus soon seems to have acquired a large territory. In the 4th century BC the city state covered most of the southwest Crimea and its fertile coast, including towns like Kerkinitis and Kalos Limen. Fortified farms with towers were built in this area, and at the same time the production of local amphorae began (for exporting wine). Coins were also minted from the 4th century BC.

In the 3rd century BC, however, the city state was badly affected by Scythian and Sarmatian invasions. Archaeological evidence shows that all surrounding settlements were destroyed and burned: several farmhouses contained human skeletons (apparently victims of a surprise attack) and in western Crimea coin hoards were found, hastily buried by the inhabitants. In Chersonesus itself the people, apparently expecting further attacks, built a new line of town walls from grave stelae of the city's necropolis. Chersonesus never fully recovered from this destruction; its agricultural settlements were in ruins, fields and vineyards destroyed, the export of goods and the production of amphorae almost brought to a standstill. At the end of the 2nd century Mithridates VI of Pontus protected the city against the Scythians, but Chersonesus lost its external territories; later it was integrated into the Bosporan kingdom by Asandros. When the Scythians besieged the city again in AD 60/61, Nero installed Roman soldiers and a naval detachment. Under Hadrian the Bosporanian king Cotys II also controlled Chersonesus; Antoninus Pius re-established the city's independence.

In the 2nd century AD Chersonesus was the starting point for the conversion of the Crimean population to Christianity. It was here that the banished bishop of Rome, St Clement, was martyred during the persecutions under the emperor Trajan. By the beginning of the 4th century Christianity was firmly established in Chersonesus.

During the Byzantine period, the city – now called Cherson (this name is attested at least since Hadrianic times) – gained great importance because of its strategic position in the empire's northern defence system and its control of the major sea routes. The Hellenistic town walls were repaired at the end of the 5th century and reinforced with towers and bastions in the reign of Justinian; further restorations took place in the 7th and 8th centuries. Moreover, between the 5th century and the end of the 10th some 30 churches were built in Cherson, among them four luxurious basilicas and a cruciform church. This last was discovered in 1897 and had an altar containing a silver reliquary bearing a monogram, bust, and control stamps of Justinian I. The city seems also to have been a place of exile for prominent persons, among them the pope St Martin (AD 655) and the emperor Justinian II (695). In the 8th century Cherson belonged to the Khazars, but Byzantine rule was re-established in the earlier part of the 9th century, and for the

next three centuries Cherson was again the most important outpost of Byzantium in the northern Black Sea. It became a centre for Byzantine diplomatic, ecclesiastical, and military activity in relation to the peoples of the steppe. Knowledge of them proved to be of great value to the monks Cyril (originally Constantine the Philosopher) and Methodios, who spent the winter of 860/61 at Cherson before setting out on their missionary work. In the 10th century Cherson was a focal point for relations between Byzantium and the fledgeling Russian state. It was here that in 988 prince Vladimir of Kiev was baptized by the metropolitan of Cherson and married Anna Porphyrogenneta ("born in the purple"), the sister of Emperor Basil II (976–1025); the prelates of the metropolitanate of Cherson then accompanied the couple to Kiev, where they founded the Russian Orthodox Church. The same Vladimir had shortly before conquered and destroyed Cherson, because Basil had at first reneged on his promise to send Anna as Vladimir's wife-to-be in return for his help against a mutiny in Cappadocia.

The Byzantines rebuilt Cherson, but it did not fully recover and its strategic importance further dwindled following the Byzantine reconquest of the Danube delta. In 1081 the Seljuk Turks captured Sinope, Cherson's main supplier of wheat, for the first time, and again definitively in 1194. With the fall of Constantinople to the Franks and Venetians in 1204, Cherson lost its main centre of support. For a time this role was filled by the so-called empire of the Great Komnenoi of Trebizond (which had come into being as a spinoff of the disintegrating Byzantine empire), but the establishment of new commercial outposts by the Genoese and Venetians contributed to Cherson's decline. In 1299 the city barely survived a destructive invasion of Tatars and Mongols. Byzantine sources last mention it in 1396; it was finally abandoned some decades later.

Summary

Greek colony in the southwest Crimea, near modern Sevastopol, founded by Heracleans and Ionians at the end of the 6th century BC. Flourished in the 5th and 4th centuries but lost its rich agricultural surroundings to the Scythians and Sarmatians in the 3rd century BC. Important role in Byzantine times and for the spread of Christianity in Russia. Destroyed by the Mongols in 1299, finally abandoned in the 15th century.

Children

For Hellenic culture the family is central and childlessness a catastrophe. Men need children to inherit their property and perpetuate the paternal line, while the primary function of wives has been to fulfil this patrilineal ambition. The childless have resorted to remedies of varying efficacy, from the ancient practice of incubation (documented in inscriptions from the shrine of Asclepius at Epidaurus, 4th century BC: *Inscriptiones Graecae*, 4. 2. 121–2) to today's more sophisticated medical interventions, but, since the traditional purpose of marriage is to produce heirs, often the consequence of infertility has been marital separation. Children have been important to Hellenic society in terms both military and political: in the 4th century BC Dinarchus claimed that a man without legitimate issue could become neither an orator nor a general (1. 71) and in Sparta bachelors were mocked publicly, while temporary relaxations in marriage laws in times of war and depopulation reflect anxieties about maintaining the birthrate.

While Greek culture has regarded unproductive marriage as anomalous, the partible inheritance system (in which an estate is divided among all its legitimate inheritors with no rule of primogeniture) which pertained at ancient Athens and in the Hellenistic and Byzantine worlds, together with the problem of poverty and the obligation to dower daughters, meant that children were not always a blessing. Large families were (and still are) a luxury; Polybius in the mid-2nd century BC claimed that family planning led to prosperity (36. 17. 5). High infant mortality rates due to primitive obstetrics and medical care limited family size, but contraception was largely ineffective (one 4th-century BC Hippocratic text suggests a posset of beans and water: *On the Nature of Women*, 98) and adoption for the ancient and medieval Greeks was not a means of finding a home for unwanted children but of ensuring an heir for the paternal estate, the usual adoptee being a male adult. Indeed at Athens foundling children could not be adopted since the consent of the child's father was needed. Furthermore, while the orphans of Athenian citizens killed in battle were supported at the expense of the state (Thucydides, 2. 45), state-run orphanages that cared for abandoned children did not appear until the Byzantine era, and they were few and far between.

Since contraception was unreliable and celibacy not an option (for pre-Christian Greeks at least), the standard methods of disposing of unwanted children were abortion and infant exposure. Abortion, legal in Greece today, is condemned by Orthodox teaching. However, pre-Christian concerns about abortion centred on the issue of paternal authority and the potential destruction of heirs rather than the sanctity of human life – only fathers (or, if the father was dead, the child's or embryo's agnatic kin) could decide to abort or expose

offspring, and the mother who attempted to appropriate this power of decision was liable to prosecution (see Lysias, frr. 8a, 8b). Exposure must be distinguished from infanticide, which in Hellenic society has been almost invariably the object of religious proscription. Infants were left typically in places where people went, and they were intended to be found. The usual fate of foundlings was slavery and, for girls, the brothel. Ambrose suggested that, while the poor practised exposure, the wealthy favoured (or perhaps had access to effective methods of) abortion (*Lex.*, 5. 58). At Sparta the decision to raise a child belonged not to its father but to the elders of his tribe. "Defective" infants were cast into the Apothetae, a chasm under Mount Taygetus (Plutarch, *Lycurgus*, 16).

Demographic evidence suggests that the Greeks of antiquity practised selective female exposure; a letter of the 1st century BC from a soldier to his wife orders her to expose their unborn baby if it turns out to be a girl (*Oxyrhynchus Papyrus* 744). Indeed, Greek culture traditionally values sons more highly than their sisters, a partiality that illustrates the radical gender bias inherent in Greek society; at ancient Athens males alone could inherit and for Greeks ancient and modern the engendering of boys is a mark of masculinity. Even at the dawn of the 21st century sons may count for more than daughters; when asked how many children they have, Greek men may enumerate their sons only (see Vermeulen 1970).

The Greek Constitution now insists that both parents share equal rights and responsibilities in parenting (article 4, para 2, 1975) but earlier Hellenic society prioritized paternal authority. At Athens the father acknowledged paternity on the *dekate*, the tenth day after birth, while the formal rejection of an older child was possible (*apokeryxis*). In antiquity, as now, children were legal minors, subject to the authority of a guardian (*kyrios*), normally the child's father, although at Athens in the Classical period the archon was obliged to appoint a guardian – usually an agnatic male relative – for orphans. The children of divorced parents or widows belonged to their father's house and the modern assumption that children should live with their mothers in the event of marital breakdown or paternal death represents a radical reversal of ancient practice. Yet the trend has its roots in late antiquity; Byzantine law insisted that stepfathers adopt the children of a wife's previous marriage.

At Athens sons became their own *kyrioi* when they attained their majority (at about 18), although daughters, being perpetually legal minors, remained throughout their lives under the guardianship of either their male natal kin or their husbands. Although adult sons were legally independent, filial obligations remained strong; honour was due to one's parents as to the gods and sons could be disfranchised for mistreating their parents (Demosthenes, 10. 40–41; Lysias, 13. 91). In the Byzantine period the Roman law that legally subordinated adult children to their fathers (*hyperexousia*) was accepted by Justinian, and later the *Prochiron* (907) required that sons desiring legal independence should be formally emancipated from paternal power, although Leo VI (886–912) granted legal independence to sons who had established their own *oikoi* (households). Paternal authority persisting into adulthood led to tensions (John Chrysostom claimed that sons preferred their fathers not to live too long in *Colosseos*, 1. 3 – see *Patrologiae Cursus Completa, series Graeca*, 62. 303, edited by J.-P. Migne), yet the threat of disinheritance may have motivated sons to keep on good terms with their fathers – while the legal minimum to be divided among all legitimate sons was one-quarter (later one-third) of the paternal estate, the amount could be divided unequally (Justinian, *Novellae*, 115. 3).

The children of "illegitimate" unions were dealt with variously. At Classical Athens a child was a bastard (*nothos*) if he did not result from a union legitimized by *engue* (betrothal) or *epidikasia* (legal process) in the case of an *epikliros* (heiress). *Nothoi* born to free Athenian parents were not members of the *oikos* but could inherit a residual portion of their fathers' estates in default of legitimate heirs; Justinian also allowed illegitimate children to inherit in the absence of legitimate sons (*Codex Iustinianus*, 5. 27. 8). The treatment of children of concubines and slaves underwent various changes; at Athens in the 5th century BC the children of citizens and free alien concubines could perhaps be legitimized, although this was no longer possible in the 4th century BC. Children of citizens and slaves, however, were slaves and belonged to their owners. In the Byzantine period Constantine insisted that children of freedmen and slave women remain slaves (*Codex Theodosianus*, 12. 1. 1, 4. 8. 7), although later Justinian rendered such children automatically free unless this was proscribed by the father's will. In 479 Zeno legitimized automatically children of free men and free concubines, a law extended by Justinian in 539 to embrace children of slave concubines. Children born of two slaves were throughout the period owned by their parents' masters. In post-Solonic Athens the law debarred parents from selling their children into slavery (Plutarch, *Solon*, 23. 2) and Byzantine children could be neither sold nor abandoned, although in 329 Constantine legalized the sale of children with the right of later repurchase.

Ancient literary representations of children begin with that of Astyanax in the *Iliad*. Erinna mentions little girls who play with dolls and are afraid of the "bogeywoman" Mormo (*Distaff*, *Greek Literary Papyri*, 3. 120, 4th century BC), while the death of children, from the horror of infanticide (Euripides' *Medea* and *Hercules Furens*) to the accidental death of 119 schoolchildren on Chios (Herodotus, 6. 27) evokes pathos and often signifies the end of the paternal line. *Choes* (pitchers) of the Classical period and Hellenistic art exhibit a particular interest in children, while Christian iconography frequently represents the infant Jesus.

In antiquity children were considered wild (Plato, *Timaeus*, 44a–b). Education was essential to "tame" children and to prepare them for adult roles and responsibilities – politics and war for boys, marriage for girls. A child's first learning experience was at home where the women of the household played an important part in the transmission of culture through storytelling and religious instruction (Plato, *Laws*, 887d–e). Many mothers took their children's education seriously – in the 2nd century AD Plutarch mentions a mother educating herself in order to educate her children (*Moralia*, 14b–c) and advises that wetnurses, who in the past, when weaning occurred at the ages of 2 or 3, exercised a significant influence on their charges, should be Greek-speaking and of good character (*Moralia*, 3e). Boys were removed from the sphere of female influence at 7 or 8. The Spartan *agoge* (education system) separated boys from their families at the age of 7, while elsewhere boys whose families could afford it were educated at schools where Homer and, later, Christian texts such as the Psalms formed the basis of a

literary education, although many Christians such as Basil of Caesarea found pagan texts morally problematic as a didactic tool. Military training was crucial for boys and institutionalized homosexuality was an educational feature of many Greek states including Sparta (Xenophon, 2. 12) and Dorian Crete (Ephorus, fr. 70. 149). Physical education at the gymnasium and social education at the symposium were usually the province of boys, but music and dancing were common to both sexes; Alcman and Sappho in the 7th century BC attest to girls' choirs. However for girls education was essentially domestic: spinning and weaving were taught at home and up to recent times girls had limited access to formal education. Indeed, until the late 20th century Greek families financed the education of their sons but seldom that of their daughters.

The children of the poor and slaves worked at home, on the land, or at a trade; a papyrus from the Hellenistic period documents the case of a slave child apprenticed to a weaver (*Oxyrhynchus Papyrus* 1647). Childhood was short for many children in the past; girls were married young (although *Peira*, 49. 22 describes penalties for those who married girls under 12) and in the mid-7th century 10 was the minimum age for taking monastic vows. The 20th century has seen the extension of childhood into late adolescence as a much greater proportion of children, girls as well as boys, remain in education longer, while the minimum age for marriage in Greece is now 16 (18 without parental consent).

Chios

Island in the eastern Aegean

The island of Chios has been inhabited almost continuously from the Stone Age to the present day. This it owes at least in part to its fertile soil and to its geographical position, located in the eastern Aegean just off the coast of Asia Minor, from where over countless centuries it has been able to exploit the trade routes north to the Hellespont and the Black Sea and south, west, and east to the Mediterranean, the Levant, and Egypt.

The earliest evidence for human habitation comes from the cave site of Ayio Gala in the northwest of the island, and dates from the early Neolithic period in the 6th millennium BC. In the 5th millennium BC a settlement was also established at Emporio in the south, and continued in almost constant use through the Early, Middle, and Late Bronze Age. Then around 1100 BC Emporio, in keeping with other Mycenaean sites all over the Aegean, suffered catastrophic destruction by fire and abandonment by its population. Our understanding of the subsequent Dark Age period is confused, though probably around 1000 BC the island was colonized by Ionian Greek-speakers arriving from the west.

By the 8th century BC Chios shows evidence of increased activity, including the refoundation of a settlement at Emporio, the existence of a religious sanctuary at nearby Kato Phana, and clear indications of active overseas trade. The 7th century BC was a time of great expansion and development for the island, in terms both of its mercantile trade and also of its external cultural and political relations. Together with other Greek cities, it founded the trading station of Naucratis in Egypt and, joining with 11 other cities in the eastern Aegean,

Chios: monastery of Nea Moni, founded in the mid-11th century by the emperor Constantine IX Monomachos

established the Panionium or league of Ionian states. By the Archaic period the island was united under the control of Chios town, situated in the middle of the east coast. This was a time of great prosperity, when Chios emerged as one of the leading naval powers in the Aegean. Its products of gum mastic, turpentine, decorated pottery, fine cloth, figs, and wine were exported widely throughout the Aegean and beyond. So famous, indeed, was its wine that Chian coins were recognized by their emblem of the wine amphora. In addition to its commercial activities, Chios also became renowned for its school of sculptors: Chian artists such as Archermus, Bupalus, Micciades, and Glaucus exerted a strong influence on Archaic Greek sculptural style and were much sought after for their work. Also by the 6th century BC Chios had firmly established itself in the Greek poetic tradition: claiming to be the birthplace of Homer, a claim strongly contested by neighbouring Smyrna, the island became home to the Homeridae, a school of rhapsodes who asserted their descent from Homer himself. In the Classical period, too, Chios' influence on the arts and learning remained strong: the tragic poet Ion, the historian Theopompus, and the sophist Theocritus all numbering among its sons.

Although the early political history of Chios is scarcely understood, a fragment of an inscribed stele found on the island and dating to 575–550 BC represents one of the earliest extant documents in Greek constitutional history and shows that Chios was already attempting to move towards a democratic system of government. In its external relations the island prospered as long as the Lydians controlled western Asia Minor. In 545 BC, however, the Lydian kingdom was destroyed by the Persians, who imposed harsh tyrannical rule on the Ionian cities, including Chios. The Ionian response came in 499 BC in the form of a revolt in which Chios, as a naval power, played a major part. The subsequent defeat of the allies brought down a terrible reprisal on Chios in 493 BC, when the Persians marched across the island leaving death and destruction in their wake. The Persian domination persisted until their defeat at the hands of the Greeks in 479 BC. Independent once again, Chios now elected democratic leaders, and joined the Delian League under the leadership of Athens. Peace and prosperity returned to the island and the Chiots became famed for their wealth and luxurious lifestyle, which was supported by vast numbers of slaves. The Peloponnesian War (431–404 BC) proved a rude interruption to this idyll, especially when in 412 BC the Chiots revolted against their Athenian allies, an act that ended in Chiot defeat and fierce retribution by the Athenians. Following the close of the Peloponnesian War, Chios fell successively under Spartan and Athenian control. Subsequently it resisted the rise of Macedonian power, which led to its capture in 333 BC by one of the generals of Alexander the

Great and the imposition of a Macedonian garrison. In 332 BC Alexander sent a letter to the Chiots (inscription in Chios Museum) in which he ensured the restoration of the democracy, previously undermined by an oligarchic faction, and ordered a contribution of 20 Chiot triremes for his fleet. During the Hellenistic period the island regained its independence and passed in turn under the influence of Ptolemy I, the Seleucids, the Attalids, and the Macedonians. But its glorious days of wealth and power were now long over. Pro-Roman in its stance, Chios fared well in Roman hands, retaining its autonomy, but suffered severe damage in 86 BC during the Mithridaric wars. An earthquake of 17 BC brought further hardships, though these were in part offset by the aid extended to the island by Tiberius. In AD 70 the autonomy of Chios was abolished by Vespasian, and by the end of the 1st century AD economic decline had set in.

The early Christian history of Chios is obscure. St Isidorus, the island's patron saint, was at work there during the 3rd century, and the first official record of a Chiot bishop is of Tryphon in the 5th century. However, the archaeological evidence suggests that between the 4th and 7th centuries Chios enjoyed increased prosperity with basilica churches being built at Emporio, Chios town, and probably Kato Phana. The destructive Arab raids of the mid-7th century, however, ushered in a further period of decline and it is not until the 10th and 11th centuries that signs of recovery and development are again visible. The concern of the central Byzantine state for the security and welfare of the island now becomes clear in the construction of a fortress in Chios town, the presence of royal officers, and the founding of the monastery of Nea Moni. This highly important monument, endowed by the emperor Constantine IX Monomachos (1042–54), preserves some of the finest examples of Byzantine mosaic, painting, and architecture known to us.

By now once more attractive to foreign powers, attempts were made to seize Chios in the years 1125–71 by the Venetians, while between 1204 and 1225 the island fell subject to the Latin empire of Constantinople. In their turn, the Genoese set their sights on Chios, occupying it for the first time in the years 1307–29, and more permanently a second time between 1346 and 1566. Genoese interest in the island focused on the suitability of Chios as a mercantile depot for Black Sea commerce. Their administration of the island was controlled by Maona, a Genoese chartered company, most of whose members were drawn from the Giustiniani family while the "Podestà", or governor, was directly appointed by the Republic of Genoa. Although they ruled the native inhabitants with a heavy hand, the Genoese nevertheless ensured the security of Chios, building many defence towers and fortresses, and oversaw efficient agricultural production. Cultivation of citrus fruit and mastic and the manufacture of silk resulted in an increase in the wealth and population of the island, and the export of its products far and wide throughout the Mediterranean world. Mastic, a resin of the lentisk tree, grows only in the south of Chios and since antiquity the island had therefore possessed a monopoly on this valuable commodity, which was famed for its medicinal and other uses. Under Genoese encouragement, fortified mastic-producing villages, such as Pyrgi, Mesta, and Olympoi, now sprang up in southern Chios. They were located inland at a distance from the sea, in order to escape the greedy eyes of pirates and Turks, were built around a central defence tower, and presented high, blank perimeter walls to the outside world. The Genoese, together with the old Byzantine noble families, meanwhile, built gracious mansions surrounded by citrus estates in the Kampos district to the south of Chios town.

In 1566 Chios was taken by the Turks. Thereafter, despite the attempts of the Florentine Knights of St Stephen (1599) and of the Venetians (1694–95) to wrest the island from them, Chios remained under Ottoman control until 1912. During this period, at least until 1821, the inhabitants enjoyed a considerable degree of political and religious autonomy and also economic prosperity, although they did have to remit heavy taxes to the foreign overlord. Trade continued to flourish, although Chios's position as the foremost mercantile port for ships plying between Constantinople and Europe, and between Constantinople and Syria-Egypt, had by the mid-17th century taken second place to nearby Smyrna. The island's prosperity and relative autonomy led, furthermore, to its fostering of cultural Hellenism. The School of Chios, founded in 1792 and financed by Chian merchants, possessed a library and printing press, the library owing much to the scholar Adamantios Korais. Another great scholar associated with the school was Neophytos Vamvas, a prolific writer on a number of subjects. Together with men such as Alexandros and Nikolaos Mavrokordatos, they safeguarded intellectual and spiritual Hellenism under the Ottoman occupation. When the War of Independence broke out in 1821, Korais was instrumental in encouraging the uprising. In 1822 the Chiots joined the rebellion, only to be punished by terrible massacres, enslavement, and destruction at the hands of the Turks. In revenge, Konstantinos Kanaris, commander of the powerful naval fleet of Psara, a small but important island lying off the west coast of Chios, destroyed the Turkish flagship. The Turkish massacres were vividly portrayed in Delacroix's famous painting (Paris, Louvre) of the outrage, a work of art that was to help shape western support for the Greek struggle for independence. The massacres of 1822 had deep and long-lasting effects on Chios. Many of those who survived fled the island and established settlements throughout Greece and overseas. The more fortunate of the refugees, such as the Rallis brothers, later became successful merchants in London, Paris, Marseilles, Palermo, Odessa, Alexandria, and elsewhere. In 1912, during the Balkan Wars, Chios was finally liberated and joined with the independent state of Hellas. Following the disaster of 1822 and also a catastrophic earthquake in 1881, which killed thousands and destroyed much property, shipping came to play an increasingly significant role in the revival of the Chian economy and, following the liberation, the merchant navy continued to expand. Many Greek shipping families, such as Chandris, Hadjipateras, Laimos, Livanos, Lyras, and Pateras, hailing from both Chios and the neighbouring islets of Oinoussai, generated great wealth during the 19th and 20th centuries. But despite its liberation, Chios' days of occupation were not yet over, for between May 1941 and September 1944 it suffered subjugation at the hands of the German forces during World War II.

Today the once teeming population of the island has declined as a result of urban drift and overseas emigration to countries such as America and Australia. Accordingly, agricul-

tural production has shrunk, though mastic cultivation in the south of Chios continues to harvest a lucrative monopoly. Shipping also still plays an important role in the island's life and economy, and though some limited tourism has developed in recent years, this still prosperous island is by no means dependent on the tourist industry. Culturally, too, Chios fulfils a significant role as home to the Korais Library, rebuilt in 1886, and today one of the most important libraries in Greece.

LESLEY A. BEAUMONT

Summary

Chios has been inhabited since the early Neolithic period. In the Archaic period it helped found Naucratis and established the league of Ionian states. This was a period of great commercial and cultural prosperity. Sacked by the Persians, Chios joined the Delian League and enjoyed renewed prosperity in the 5th century BC. Gradual decline set in under the Romans and Arabs, but Chios flourished again in the 10th and 11th centuries. After rule by Venetians, Latins, and Genoese, Chios fell to the Ottomans in 1566. There were terrible massacres in 1822. The island was joined to Greece in 1912.

Choricius of Gaza

Sophist and orator of the 6th century AD

Choricius lived and taught in his native city of Gaza in the age of the emperor Justinian (527–65). He was a pupil of the orator Procopius who had established a famous school of rhetoric there. Choricius succeeded his teacher as master of the school (*c.*538–50) and, as his speeches in front of the City authorities at festivals and other occasions suggest, he became the most acclaimed orator in the city of Gaza after Procopius. Choricius belongs to the rhetorical tradition which goes back to the Second Sophistic, a tradition of epideictic oratory favouring the composition of *declamationes* (*meletai*, rhetorical exercises on a given topic), rhetorical descriptions (*ekphraseis*), and speeches. Rhetoric was well established in the school curriculum, as was the teaching of grammar. The practice of declamation became particularly prominent in Greek schools of the period. Orators and sophists such as Aelius Aristides (2nd century AD) became models of this kind, while the handbooks of Hermogenes (2nd century AD) and Aphthonius (4th century) offered a systematization of this school rhetoric, the so-called *progymnasmata* (rhetorical exercises). This tradition reached a peak in Constantinople and Antioch with Libanius in the 4th century. Then in the 6th century Gaza became the new centre where rhetoric flourished. Rhetorical products of this kind required rigorous style and imaginative content and, despite their heavy rhetorical flavour, they often have considerable literary claims.

A number of Choricius' works have survived, which can be classified under three headings: speeches (8), declamations (12), and *dialexeis* (25), that is, a preliminary informal talk (basically an argument) preceding the delivery of a major speech. Several of his speeches and his declamations are prefaced with a *dialexis* and/or a *theoria*, an introductory piece containing information about the issue to be treated and the mode of its treatment. Unlike the *theoria*, the *dialexis* is not necessarily related to the main speech, but some of them discuss problems of declamation. Like Procopius and Aeneas of Gaza, Choricius himself was a Christian. Thus, in his encomiastic speeches to bishop Marcianus he employs traditional rhetorical means for the description of the architecture and the paintings of the churches of St Sergius and St Stephen in Gaza, built by Marcianus. But, these few works apart, in which we find allusions and references to the Bible, there are few traces of Christian influence in his work, which, faithful to rhetorical conventions, is permeated by pagan ideas and imagery. Choricius' speeches are both encomiastic and funereal. They address high-ranking local officials, and one funeral speech is devoted to his teacher Procopius. The themes of the declamations were determined by the rhetorical tradition – preeminently representations (*ethopoiiai*) of either stock characters (e.g. the avaricious older man) or mythical/historical pairs (e.g. Patroclus, Miltiades). They are often treated in pairs of opposites (Polydamas/Priamus, the young hero/the old miser). Choricius' versions of these stock themes are particularly elegant and his fictional discourse attains a high degree of sophistication.

Choricius' most interesting work for us today is his speech in defence of mimic theatrical performances entitled *Apology*

for the Mimes (*Synegoria Mimon*). This is the last surviving text from antiquity concerning ancient theatrical performances. Although it is a mere rhetorical exercise, probably delivered in public in a theatre, it is invaluable for the information it contains about the popular genre of mime. The work presupposes mimic performances in Constantinople before 526, when Justinian issued an edict against theatre performances, but it may well have been written after this date. The Church targeted mimic performances on the ground that they had a bad effect on public morals, and John Chrysostom and Libanius were fierce critics of them. The topic thus lent itself to rhetorical advocacy. Choricius addresses the most important charges against mimic performances; the actors of the mime are defended against charges of immorality and the performances against charges of arousing bodily desire. The mime is presented as beneficial for the city, having a good effect on both the citizens and the authorities. Given the nature of his work, it is difficult to say what Choricius really thought about his subject, but this does not make his testimony less valuable.

Typical of the rhetorical products of this kind, Choricius' works are full of allusions and references to earlier Greek literature, on which he evidently was particularly knowledgeable. Homer, the Greek dramatic poets, Thucydides, Plato, and the Attic orators serve as examples of pure Attic style and colour every piece of Choricius' work. From among his contemporaries, he is most indebted to Libanius and to his teacher Procopius. Choricius writes Atticizing Greek and is particularly rigorous about his style. His works suffer from the weakness of the rhetorical works of this kind, namely excessive use of rhetorical schemes and poetic expressions, trivial ideas, rhetorical excess, and sophisticated style. However, they are valuable testimonies of his age. They contain important information about local personalities, history, and culture. His accounts of festivals (both pagan and Christian) and other cultural activities in Gaza are invaluable as they illustrate a gradual transition from paganism to Christianity. Choricius testifies to the survival of pagan customs and festivals in a largely Christianized society and sheds some light on the social life of Gaza, highlighting the role of the bishop and other local authorities. Choricius' works were used by subsequent generations of Byzantines; Photios, who read them, judges Choricius' style fairly and praises his Christian faith.

GEORGE E. KARAMANOLIS

Biography

Choricius (*fl.* 6th century AD) lived and taught in Gaza where he was a pupil of the orator Procopius. He succeded Procopius as master of the school of rhetoric at Gaza and himself became a noted orator. Surviving works include speeches, declamations, and arguments which give valuable information about the society and architecture of Gaza and about contemporary attitudes to the theatre.

Chortatsis, Georgios

Cretan playwright of the late 16th century

Georgios Chortatsis is the most important figure in Cretan Renaissance drama, but, paradoxically, the one about whom least is known. Although there have been several attempts to identify the playwright with persons of the same name known from contemporary archival sources, none can be regarded as conclusive. All that can be said is that he was a native of Rethymnon, though he later lived in Kastro (Chandax), was active around the last decade of the 16th century, and was the author of at least three plays and two sets of dramatic interludes. Since his works are dated before any of the other surviving Cretan plays, he may have been the person responsible for the introduction of Renaissance drama in Greek (other Cretans are known who wrote plays in Italian a decade or two earlier). Among his circle of acquaintances were several influential persons of the time, including the Veneto-Cretan nobleman Markos Antonios Viaros and the lawyer Ioannis Mourmouris, to whom he dedicated *Panoria* and *Erofili* respectively. Internal evidence shows him to have been familiar with a wide range of Latin and Italian literature, particularly 16th-century works by Trissino, Speroni, Ariosto, Tasso, Guarini, and others.

The plays definitely known to have been written by Chortatsis include one of each of the three main dramatic genres of the time: the pastoral comedy (*tragicommedia pastorale*) *Panoria*, the tragedy *Erophili*, and the comedy *Katzourbos*. *Panoria* (which used to be known as *Gyparis*) is usually regarded as the earliest of the three works, dated around 1590. It is a work of Arcadian sophistication, but located in the Cretan countryside, specifically on Mount Ida; it is an Ida adapted to pastoral conventions, with goddesses and Nereids inhabiting its woods, shepherdesses hunting deer, and Cupid armed with bow and arrows. Chortatsis draws on Guarini's *Pastor Fido*, Tasso's *Aminta*, and perhaps also Grotto's *La Calisto* for some episodes, but borrowed material is artfully reworked to suit the plot requirements of the Cretan play. It centres on the loves of two pairs of shepherds, Gyparis and Panoria, and Alexis and Athousa. Two comic characters, Giannoulis, the father of Panoria, and the worldly-wise old woman Phrosyni, try to persuade the two shepherdesses to accept the advances of their swains. The successful outcome is brought about by the intervention of Aphrodite and her son Eros. The tragic posturings of the two love-sick shepherds are counterbalanced by the comic, and often bawdy, talk of the two older characters. Despite all the rustic humour, the liberated attitudes of the two shepherdesses have a very modern

resonance. Chortatsis successfully adapts the conventions of pastoral drama to a Cretan context: his play is much more down-to-earth than the sophisticated artificiality of Italian pastoral.

Erophili was certainly completed after *Panoria* but can be dated only approximately to about 1595. It was the only one of Chortatsis' plays to be printed during the Cretan Renaissance period: an unsatisfactory edition was published in Venice in 1637, but a much better one appeared in 1676 and was several times reprinted. Three manuscripts have also survived. Chortatsis based his play on the plot of Giraldi's *Orbecche*; secondary sources include Tasso's *Il Re Torrismondo* and *Aminta* and Trissino's *Sofonisba*. Comparison with *Orbecche* reveals Chortatsis's superiority as a dramatist, in terms of both plot construction and characterization. The play is set in Egypt, where king Philogonos has usurped the throne after killing his brother. His daughter Erophili has secretly married Panaretos, a noble general. The drama reaches its height with the king's discovery of the marriage. In revenge for the affront to his honour he kills Panaretos and offers the dismembered remains to Erophili as a wedding present. Erophili commits suicide and, in the final scene, the king is killed by the chorus of the princess's handmaids. The chorus, which has commented on the action in choric odes at the end of each act, thus finally assumes an active and decisive role, avenging the heroine's death. The play's sophisticated construction is particularly noteworthy: alternating monologues and dialogues vary the pace, suspense and dramatic irony are artfully employed, and the speeches, particularly those of Erofili, are infused with a lyrical intensity. A set of four interludes associated with the play in the manuscripts and editions tell a contrasting and unrelated story: the episode of Rinaldo and Armida from Tasso's *Gerusalemme Liberata*. Words, music, and dance combine with elaborate effects to provide relief from the emotional intensity of the tragedy – if at least it can be assumed that the interludes were intended for performance between the acts.

Katzourbos was completed between 1595 and 1601, a dating based on allusions in the play to contemporary persons and events. It belongs to the tradition of *commedia erudita*, and makes use of stock characters such as the gluttonous servant, the pedantic schoolmaster, and the *miles gloriosus*. The plot is trivial enough: Nikolos is in love with Kassandra, the presumed daughter of the courtesan Poulisena, but is rivalled by old Armenis, who plans to buy a night of pleasure with Kassandra. An elaborate plan is laid to deceive Armenis by substituting Poulisena's maid Anneza for Kassandra. Armenis's amorous adventure is thwarted by his wife, and the intrigue is finally resolved by the discovery that Kassandra is really Armenis's long-lost daughter, who had been carried off from Naxos by Turkish pirates and sold in Crete. All ends happily with the marriage of Kassandra and Nikolos. Interwoven into the story line are various comic episodes involving the braggart captain, the schoolmaster, and the servants. Although there are some weaknesses in the plot (perhaps in part due to changes made by a later adapter), Chortatsis' comic inventiveness never flags. He exploits a wide variety of humorous effects, both verbal and visual, showing an awareness of contemporary Italian theories of laughter and rhetoric. Topical and local references to people, places, and events would have enhanced the appeal to a Cretan audience. Chortatsis's comedy provided the model for another Cretan playwright, Markos Antonios Phoskolos, who composed his *Phortounatos c.*1655.

A further comedy, *Stathis*, has also been attributed to Chortatsis, but definite proof is lacking. The problem is complicated by the fact that *Stathis* survives only in an abridged three-act version made in the Ionian islands.

The three plays definitely known to be by Chortatsis are all in couplet-rhymed 15-syllable verse (with the exception of the choric odes of *Erophili*, which are in hendecasyllables with *terza rima*). They share the five-act structure prescribed for Neoclassical drama, and employ the Cretan dialect with many west Cretan elements. Chortatsis's poetic style is intricate and finely wrought, with long complex periods, much use of imagery, and a subtle feel for rhythm and rhyme. As K. Dimaras has written: "At no point, even in his least lyrical moments, can we forget that we are dealing with a genuine poet." Little is known about contemporary performances in Crete, but Chortatsis's work was transmitted to the Ionian islands (manuscripts of all three plays were copied there), and had a considerable influence on the development of a local dramatic tradition. Parts of *Erophili* also passed into oral tradition, either as ballads or as carnival entertainments, in various parts of Greece. All three plays have enjoyed successful revivals on the stage in recent years.

DAVID HOLTON

Biography

Active in the last decade of the 16th century, though actual dates of birth and death are unknown. Born in Rethymnon, Chortatsis was the earliest and most important of the playwrights of the Cretan Renaissance. Three plays survive: *Panoria*, a pastoral comedy, *Erophili*, a tragedy, and the comedy *Katzourbos*.

Christianity

Few episodes in antiquity are so well documented as the beginnings of Christianity; perhaps for that reason, few are so obscure. That Jesus came from Nazareth, that he preached the Kingdom of God, that he was crucified by the Roman procurator Pontius Pilate are acknowledged facts in almost every study of the subject; every other detail of his life remains the stuff of unabated controversy. We know at least what emerged as Christianity: the recognition of Jesus as the Son of God, the Messiah or Christ of Israel, the Lord of life for his followers in the present world and the judge of all humanity in the next. In the New Testament all these claims are based on a belief in his Resurrection; if there was a community that revered him only as a human teacher, it must have perished quickly, and the history of the Roman world can show no other case in which a dead man, having first received the honours due to a human being, was subsequently worshipped as a god.

Faith in Christ was initially spread by Jewish missionaries, but (apart from a short-lived community in Jerusalem) the only Churches of which we have a reliable record were established among the Gentiles. The principal author of the Gentile mission was a Hellenized Jew from Tarsus in Cilicia, Saul or Paul, who had met the resurrected Christ but not the earthly Jesus. Paul maintains that only the Resurrection can deliver human nature from the sinfulness that clings to it as a consequence of Adam's first transgression. To practise a cult of manufactured idols, like the Gentiles, or of outward ordinances, like the Jews, is to live according to the flesh; only those who have died with Christ and have been incorporated into his body through the Church can walk according to the Spirit, knowing both release from punishment and liberty from sin. Faith in the Resurrection makes us righteous in the sight of God, and prepares us to be sanctified by the Spirit of obedience, who quickened Christ himself. True sanctity and everlasting life are possible only in the spiritual body, which will be given to the elect on Christ's return.

Paul thought this to be imminent, perhaps echoing a prophecy of Jesus (Mark 9: 1 etc.); but, as expectation waned, it was necessary to seek at least a partial realization of the Kingdom of God on earth. Some of the moral precepts in the Gospels may have been part of Jesus' ministry, but Matthew strikes a new note when he makes the Church the arbiter of judgement and forgiveness in the present. The communal meal or Eucharist came to signify, not so much the expectation of Christ's return, as the remembrance of his sufferings and a literal partaking of his body. Baptism, once the sign of faith in adults, was already being administered to children in some churches by the end of the 2nd century, being explained by Origen as the means whereby Christ purges the filth inherited or incurred at the time of birth. Above all, doctrine and discipline were maintained by appointed ministers who claimed direct descent from the apostles. The division of these into presbyters and deacons, perhaps with an *episkopos* or bishop as chief presbyter, was prevalent by the end of the 2nd century in the Greek-speaking communities of Syria, Asia, Italy, and Gaul.

The scriptures of the early Christians were in Greek, and at this period they comprised all or most of the present New Testament, together with the Septuagint, the Greek translation of the Hebrew Torah. The authority of the "apocryphal" books, which have no Hebrew original, was maintained by the eminent scholars Epiphanius and Origen, and even today the Orthodox revere them as canonical, arguing that the work of the Holy Spirit in the interpretation of scripture is continuous, and that while the Church is the heir of the apostles, the Bible is the creation of the Church. The argument is stronger if one holds, with the fourth evangelist St John and Origen, that prophecy is not the work of men, but of Christ himself, who as the Word of God has been active in creation, revelation, and redemption since the beginning of the world.

Scripture and the hierarchy sustained the Church in the face of the persecutions that it suffered from Jews, from pagan magistrates, from local mobs, and even from emperors. The readiness with which Christ's people followed him to martyrdom provoked the irony of pagan writers; their refusal to treat the emperor as a god was seen as treason; and their abstinence from public cults provoked the charge that they were not only atheists but practised atrocious rites. The catalogue of Greek martyrs includes Ignatius of Antioch, Polycarp of Smyrna, Origen of Caesarea, and Peter of Alexandria; it will be observed that the centres of persecution were the great cities, which were also the localities in which the Gospel spread most rapidly. It should also be noted, however, that, where it was not purposely invited, the violence of the magistrates was sparingly employed, and almost always fell on the leaders of the Church.

Laymen, bishops, and presbyters took a hand in the development of doctrine in the early Christian centuries. The chief concern of laymen, such as Justin, Athenagoras, and Aristides, was to express their faith in a form that would be acceptable to philosophers and innocuous to political authorities. The clergy saw their task as the protection of received tradition against the fallacious inferences, denials, and deviations of other teachers, whom they stigmatized as heretics. Thus Irenaeus defends the flesh of Christ, the Resurrection, and the Old Testament against an extravagant strain of Pauline teaching, which contended that the body and the Law could have no part in the economy of salvation. In the 3rd century primitive adherence to monotheism (an undisputed tenet of Christianity) was found to be in conflict with the Trinitarian formulas that had figured in prayer and liturgy since apostolic times. In its insistence on the "three hypostases", the school of Origen offered no equivalent description for the unity of the Godhead; but when the presbyter Arius declared that the Son was no God but a creature of the Father, the adjective *homoousios* ("consubstantial") was inserted in the credal declaration of the Nicene Council in AD 325.

Christianity: relief of an empty throne awaiting Christ's second coming, with lambs representing the apostles, 4th-century Byzantine, Frühchristlich-Byzantische Sammlung, Berlin

Western influence may be suspected here, since Constantine, the first Christian emperor, was also the convenor of the council. The patronage that the Christian Church enjoyed from Constantine and his successors had a number of important consequences: an official predilection for Christianity at the expense of Judaism, thus ratifying the separation of the two religions; the practice of settling differences in doctrine by ecumenical definitions, which elevated the status of the bishops who produced them, and superseded the more informal creeds of previous centuries; the exercise of royal power in the shaping and enforcement of ecclesiastical policy, especially in the East, where the dominant emperor tended to be resident; and a transference of political and cultural supremacy to Christians, which encouraged them to make explicit use of Greek philosophy and to imitate the ornate style of contemporary writings. It was the Christianity of Byzantium that preserved the masterpieces of pagan literature.

Not everyone embraced the world so readily, and it was in the late 3rd century that Antony left his village in Upper Egypt to overcome new temptations in the desert. His early imitators were also solitaries or eremites, and in Syria the ascetics (known as stylites) are reputed to have spent their lives on pillars. But from the mid-4th century the usual form of monasticism was the communal or cenobitic one, in which a spiritual director helped the novice to vanquish carnal passions. In the texts on prayer and contemplative piety that make up the *Philokalia*, a compilation of the 18th century, we often find the simultaneous presence of very different streams of thought such as the psychology of Plato and a belief in the glorification of the flesh. Nevertheless philosophy proved to be of little assistance in reconciling the full humanity of Christ with the full divinity accorded to him by supporters of the Nicene definition. This tenet, though rejected or diluted in conciliar pronouncements of the intervening period, was reaffirmed in 381 at the Council of Constantinople, together with the equal divinity of the Holy Spirit. The same assembly, however, had to condemn Apollinarius, who denied that Christ had possessed a human mind. His principal opponents, the Cappadocian Fathers, may be regarded as the founders of the Greek Orthodox tradition. This maintains the priority of the Father in the Trinity, with the rider that all three Persons share the incomprehensibile essence of God; at the same time, it adds that Christ could not have been the saviour of humanity had he not been perfect man.

It was not enough to affirm the full humanity of Christ without assenting to a true union of these natures. The patriarch Nestorius was condemned for his alleged denial of this at the Council of Ephesus in 431; in 451, however, the Council of Chalcedon condemned the opposing error of maintaining that the human nature had been absorbed by the divinity. The council upheld the doctrine of Rome, but at the cost of a double schism, which gave rise to anti-Chalcedonian churches in Egypt and the eastern parts of the empire. These churches, whether they favoured or opposed the "Nestorian" teaching, resisted the attempts of Byzantine emperors to suppress or reconcile them, frequently displaying their independence by using Syriac or Coptic rather than Greek. Meanwhile the chief refiners of the Chalcedonian formula were Leontius of Byzantium, who argued for a mutual penetration (*perichoresis*) of the two natures; Maximos the Confessor, who persuaded the Church that Christ had not one will but two in indissoluble union; and John of Damascus, whose digest of the faith was to exert great influence even in the West. Maximos held that things divine and heavenly were mirrored both in the Church and in human nature; the commentaries of Germanos and Kabasilas show what a central place the liturgy continued to hold in expositions of Orthodox theology. While it offers no philosophical theory to explain the efficacy of the Christian sacraments, the Orthodox Church believes that the body and blood of Christ are consumed in the Eucharist, and that baptism makes infants into members of his body. The principle that the Incarnation has permanently united God to matter underlies the cult of images, which was abolished temporarily by the iconoclastic rulers of the 8th century, but restored by the Seventh Ecumenical Council at Nicaea in 787.

The seventh is the last council to be regarded by the Greeks as ecumenical. All seven were attended by the legates of the Roman see, but never by the bishops. Among the further causes of estrangement were the new dignities that accrued to

Constantinople at the second and the fourth councils, the barbarian hegemony in Italy after 476, and the efforts of the iconoclast emperors to enforce the obedience of the Roman pontiff. When Rome transferred its allegiance from Byzantium to the Franks in 800, theological differences were intensified by political hostility. The breach was recognized, rather than created, by Rome's excommunication of the patriarchate of Constantinople in 1054, and despite the councils of Lyon (1275), Basle (1431), and Florence (1438) no reconciliation has been achieved. To the crusaders of 1204 the Greeks were already heretics. The main points that distinguish their theology from that of western Christendom are:

1. *The filioque.* Eastern theologians do not speak of a double procession of the Spirit from the Father and the Son within the Trinity, though they readily accept that the Spirit was "received from" the Son in his earthly mission as the Paraclete. Western thinkers have tended, on the other hand, to follow Augustine's teaching that the Spirit proceeds from the Father and the Son. Under the Frankish emperors the words "and the Son" (*filioque*) were inserted into the clause on the procession of the Spirit in the so-called Nicene Creed. Such additions had been proscribed by the Council of Ephesus in 431, and in 1054 the *filioque* supplied the principal ground of theological dispute between the Churches. The Greeks object that it postulates two sources in the Trinity, and thus accords to it only an abstract unity. For them the Father alone is the source of unity, whereas the Augustinian theory holds that the Spirit, as the joint offspring of the Son and Father, constitutes a bond of love between them. Early proponents of the *filioque* believed that it was a necessary defence against an Arian subordination of the Son to the Father, though nowadays the Greek position is better understood. So far is it from being true that the status of Christ is lessened by the Orthodox insistence on the priority of the Father that more prayers are addressed to Christ than in the western Churches, notably the Jesus prayer – "Lord Jesus Christ, Son of God, have mercy on me a sinner" – which remains a common devotional exercise. The invocation of Mary as *Theotokos* ("one who gave birth to God") is attested in the 4th century by Gregory of Nazianzus, and Nestorius' opposition to it was the cause of Cyril's first complaint against him. Admirers of the Greek tradition argue that, by stressing the coinherence of the Father, Son, and Spirit, it encourages us to think of the Godhead as a communion of persons; Zizioulas's study *Being as Communion* has commanded much attention in the West.

2. *Redemption.* Western theologians since Augustine have often held that the death of Christ discharged a debt that we were incapable of paying for ourselves; this is often accompanied by a doctrine of divine predestination, which asserts that even faith in the atoning work of Christ would be impossible without an act of grace. The Orthodox, however, reject the view that we are incapable of virtue in our natural state, as they also reject the Augustinian doctrine that we inherit the penalty of Adam's sin. Most Greek fathers (Cyril excepted) seem to have found no heresy in the Pelagian opponents of Augustine. Maximos the Confessor gave new currency to the notion, first proposed by Irenaeus, that humans were created in the image of God but not with the perfect likeness; this was manifested by the incarnation of Christ, and is attainable, with the help of the Holy Spirit, for anyone who elects to be incorporated into his earthly body. As we retain the image (which consists in our free will or rationality), we are free to make the initial act of faith, and are therefore fellow workers or *synergoi* with the redemptive love of God. The latter is not generally regarded as an offended Lord requiring satisfaction or as a judge inflicting punishment; rather, the divine Word who created us and took flesh in order to gather us into his body, thus enrolling us in his victory over Satan and reconciling our estranged hearts to himself.

3. *Life and death.* Faith is not so much an intellectual assent as a continuous participation in the body of Christ. The Incarnation has sanctified all matter, so that veneration of icons and partaking of the Eucharist can serve as regular instruments of salvation. The elaborate liturgy of Christmas and Easter teaches that Christ brings salvation through his Incarnation, Crucifixion, and Resurrection. Although the mysticism of Evagrius in the 4th century seemed to ignore the resurrection of the body, the usual aim of Orthodox spirituality has been rather to enhance the integrity of the human person: Symeon the New Theologian tasted the glorification of the body, while the Messalians of the 4th century and the Palamites of the 14th locate the centre of devotion in the "heart". Some hold that the cooperation of God with the believer continues after death, when the latter will undergo the fires of Purgatory – not so much to expiate his sins as to make him fit for heaven. A tradition going back to Origen holds that all humanity may eventually be saved, and that even the sinner's experience of hell arises only from his refusal to accept the warmth of love.

4. *Ecclesiology.* Women are not admitted to the priesthood, though as martyrs they may attain sainthood. The saints retain communion with the living, and may be addressed in prayer; Mary, the foremost of them, is supposed to have remained a virgin for the whole of her life, which many believe to have ended with her bodily assumption into heaven. By a decree of the Council in Trullo (692), bishops, when elected, should be unmarried; priests have always been allowed to marry provided their marriage took place before their ordination to the diaconate. Dogmatic resolutions can be taken only by councils, which must be ecumenical. The patriarch of Constantinople exercises primacy de facto, though a nominal pre-eminence is still allowed to Rome.

Since the fall of Byzantium the Greek world has contracted, and now that Greece is a state, its people do not need religion to sustain their nationhood. Nevertheless, attendance at the great services remains frequent, and even where there is little knowledge of dogma, the saints' days are remembered and observed. The monasteries of Mount Athos are probably flourishing more than those of the western denominations, and Justinian's church of the Holy Wisdom (Hagia Sophia) in Istanbul (Constantinople) is among the acknowledged glories of European architecture. The poems of the 6th-century "melodist" Romanos are regarded as the best works of Greek literature between the Classical period and the late 19th century. Here, as elsewhere, the modern intellectual is no friend to traditional religion; yet the novels of Kazantzakis (*Zorba the Greek*, *Christ Recrucified*, *The Last Temptation*, *God's Pauper*) testify to its hold upon the Greek imagination.

Chronicles

By convention, history writing can be classified as either annalistic (composed of brief annual entries) or narrative. The ancient Greek world provides the earliest European examples of both, on the basis of which the Greek-speaking medieval world of Byzantium developed Christianized varieties. Byzantine-style chronicles proved remarkably long lasting.

The earliest known Greek historical records are lists of public officials, such as the priestesses of Hera in Argos, the Athenian archons, or of victors in festivals, such as the Olympic Games. Such lists were kept in each community for local purposes and provided a basis for noting events of local significance. These were the first forms of chronicles. With the establishment of the multinational Hellenistic kingdoms in the wake of the conquests of Alexander it became of interest to establish synchronicities; hence the work of Timaeus (*c.*350–260 BC) and Eratosthenes (*c.*285–194 BC) on Olympic victor lists, which could function as a universal chronological framework within which significant events could be placed. The Parian Marble (of which two fragments survive, one in the Ashmolean Museum, Oxford, the other in the Paros Museum) lists a mixture of political, military, religious, and literary events from Cecrops, the first king of Athens, onwards, dated synchronously but corrrelated backwards from the archonship of Diognetus in Athens (264/63 BC, presumably the date of composition). Significant lists of rulers and dynasties, forerunners of the fully fledged chronicle, were compiled by such men as Apollodorus of Athens (*c.*180–120 BC), Castor of Rhodes (1st century BC), Manetho of Heliopolis (*fl.*280 BC), and Phlegon of Tralles (*fl.*AD 140).

These works of pagan late antiquity formed the background against which the (now lost) Christian *Chronicle* of Eusebius of Caesarea was written (two editions: before AD 303 and 325/26). Eusebius synchronized Old Testament and Graeco-Roman history into a continuous chronological sequence calibrated by years from Abraham and, from 776 BC onwards, by Olympiads. The Greek Eusebius has not survived. The work was in two parts, raw lists (surviving only in an Armenian version) and the chronicle proper (best preserved in Jerome's highly influential Latin translation). Its purpose was to demonstrate that God's plan for man's salvation encompassed the whole of history. Eusebius established a genre, the Christian world chronicle, which was to have a long history in the subsequent Byzantine centuries, though little has survived of his immediate successors (such as the Egyptian monks Annianus and Panodorus).

The first full-length chronicle in the Eusebian mould to be preserved is that of the 6th-century John Malalas, from Antioch, which recounts world history from Creation to the reign of Justinian (527–65), dealing with biblical and Near Eastern history as well as that of mythical Greece and imperial Rome. Malalas has an acute interest in Antiochene local lore and a fondness for a good story. The balance that he gave to ancient history – much emphasis on the Trojan War, little on the Greek city states or republican Rome – affected the presentation of the past by all later chroniclers, since his work was extensively excerpted. The old assumption that Byzantine chronicles of this sort were written for monastic audiences while secular history was written by and for secular officials of high rank has now been revised. The thought worlds, for example, of Malalas and his contemporary Procopius, a secular historian writing on the wars of Justinian, have much in common; it is chiefly the form and language that differ.

Other Christian world chronicles include the *Chronicon Paschale* (Easter Chronicle, so called because it attempts to provide chronological correlations between Easter and Creation; written *c.*630), the chronicle of George Synkellos (written before 810), and those of George the Monk (*c.*866), Constantine Manasses (*c.*1140), and Michael Glykas (mid-12th century). Chronicle writers in this tradition tend to copy out their predecessors, with changes reflecting the ideologies and realities of the time of writing, up to the period when

the chronicler has personal access to oral sources. This last section becomes his personal contribution to the tradition.

The term chronicle is also applied to works in medieval Greek that cover longer periods of time and are largely independent of eyewitness accounts (the mark of the historian): into this category would come the chronicles of Theophanes (*c.*817) and Zonaras (*c.*1150); Zonaras is distinctive in naming some of his sources. There are two Byzantine chronicles in popular verse: the *Chronicle of the Morea* (14th century) describes the foundation and early history of the Frankish kingdoms in the Peloponnese, while the *Chronicle of the Tocco* (early 15th century) narrates the history of the Italian rulers of the Ionian islands and Epirus. Both used mixed language levels, which give interesting evidence of the spoken Greek of the time of composition.

From the late Byzantine period come a number of texts that provide succinct, secular, and at times enigmatic accounts of invasions: the *Chronicle of Monemvasia* (perhaps a 10th-century text, in 16th-century manuscripts), the *Chronicle of Galaxeidi* (written *c.*1703 but referring, among other topics, to Bulgarian invasions in the Peloponnese), the *Chronicle of Ioannina* (15th century, on the brutal rule of Thomas Preljubovic, d. 1384), and the *Chronicle of the Turkish Sultans* (16th century).

Lists of dated events in chronicle format also survive. The *Chronographikon* of patriarch Nikephoros I (806–13), which is a list of rulers from Creation to 829, was copied frequently: it may have become a schoolroom text. Notes in the margins of manuscripts of all kinds survive from the 10th century onwards (the so-called *Short Chronicles*), giving precise annotations of births and deaths, invasions, catastrophes, and natural phenomena, thus providing an annalistic counterpoint to the more discursive accounts of narrative historians.

The influence of the Byzantine world chronicle lingered long. Among several late 16th-century examples is the *Biblion Istorikon* known under the name of Dorotheos of Monemvasia, which takes as its basic structure a worldview that can be traced back to the 6th-century Malalas. Dorotheos's work was reprinted frequently in the 17th and 18th centuries, providing, it would seem, a textbook on world history for the Greek-speaking world of the Tourkokratia.

Chronology

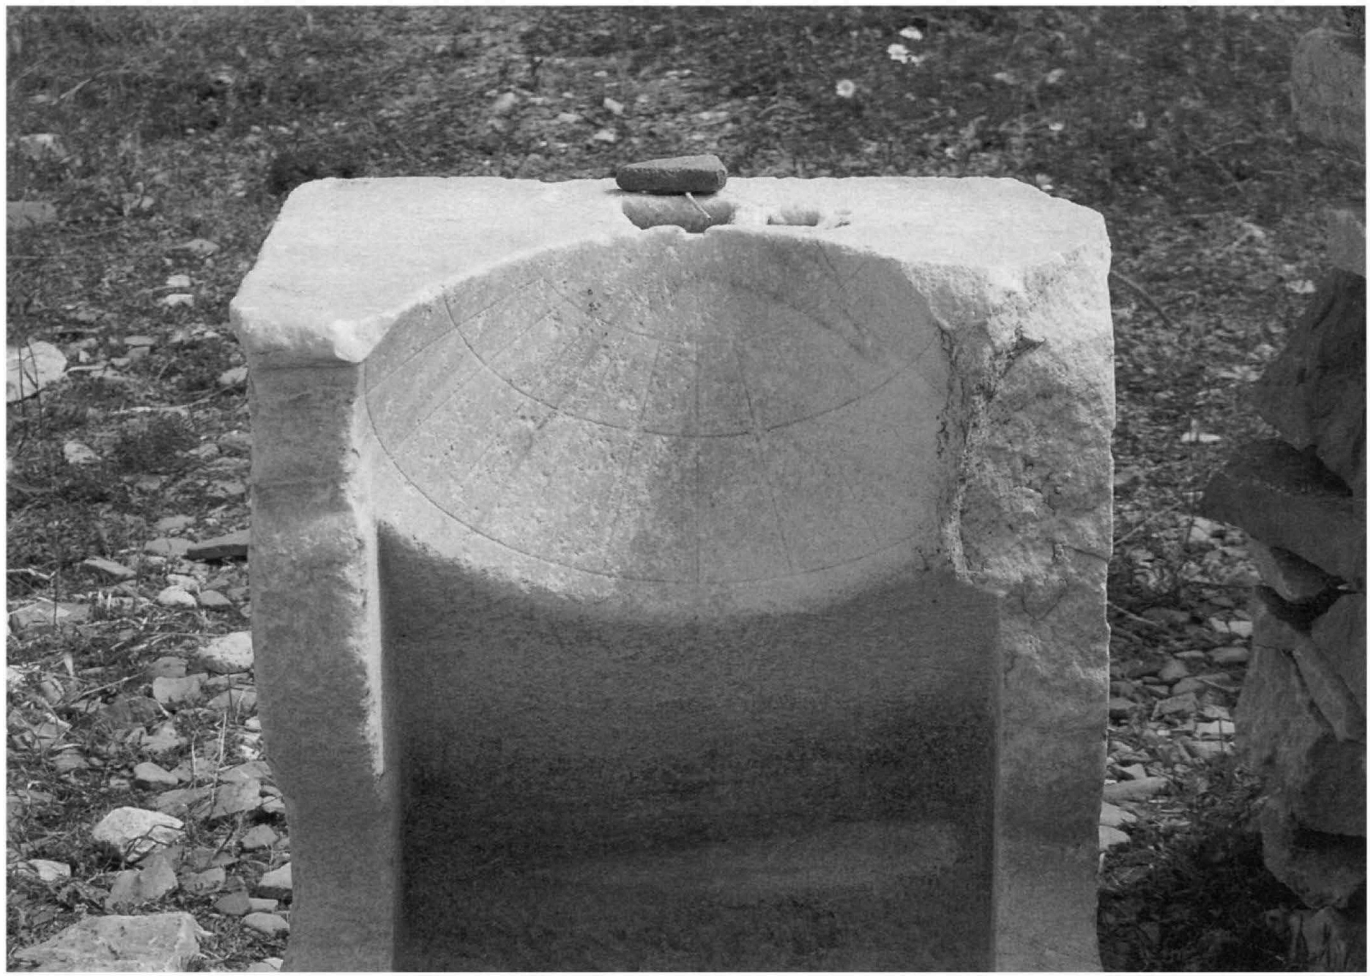
By "chronology" we mean the division of time, the ordering of events and the intervals between them on a fixed scale. The natural world has three ways of marking the passage of time: the daily cycle of night and day, the monthly cycle of the moon, and the annual seasonal cycle of the sun. The ancient and medieval Greek world had several ways of marking the succession of days in the month or year and the sequence of years, and of dating historical events whether within a short or a long time-span.

From at least the 5th century BC the full day was divided into night and day, each of 12 hours whose length varied according to season and latitude. Hours could be measured by a sundial or waterclock, but for most people internal divisions of the hour remained imprecise, though considerable precision could be achieved for astronomical calculations.

The week is an artificial temporal division not used in the ancient world. In the Greek-speaking world of the Christian east Roman empire a seven-day week, originally Hebrew but then Christianized, came into use. Each day had a mystical and liturgical symbolism sometimes apparent in the names (e.g. Paraskeve, Friday, "preparation").

By the 5th century BC Athenian astronomers had become aware that the lunar month was 29.5 days long and the solar year 365.25 days. There was no universal calendar and each Greek community used its own month names and individual date for the new year. The months were normally named after the festivals that fell within them, or after a deity. In the Byzantine world local month names remained predominant until late in the 5th century AD, but thereafter the Roman month names (Ianouaraios, Febrouarios, etc.) gradually prevailed.

In the Graeco-Roman world of antiquity prior to the reforms of Julius Caesar (44 BC) the calendar year was frequently at variance with the seasonal and solar year, despite the addition (intercalation) of days and months at irregular intervals, often for political rather than calendrical reasons. After the reform the year consisted of 365 days with one day inserted in the month of February every fourth (leap) year, a system that remained in force generally until the reforms introduced by Pope Gregory XIII in 1582 (the Gregorian calendar),



Chronology: ancient sundial at Cnidus in Caria

which removed leap-year status from century years, except for those divisible by 400 (e.g. 1600, 2000 etc.).

Between Meton (*fl.*432 BC) and Ptolemy (writing AD 146–170) an increasingly precise understanding of the lunisolar cycles was developed, giving rise to accurate predictions of eclipses, and also enabling public calendars to be set up that traced the movements of constellations throughout the year. In the Christian Byzantine empire lunisolar cycles were used to calculate the date of Easter (the results usually presented in paschal tables) and also to extrapolate to the date of Creation.

Dating of events in the short term in the ancient world (for legal documents, government decrees, some historical events) was normally by the year of the priest or magistrate into which they fell (e.g. Athenian archons, Roman consuls). Dynasties might be calculated roughly in terms of human generations. In the wake of the conquests of Alexander and the establishment of the Seleucid empire, a more precise reckoning by the Seleucid era (beginning from 312/11 BC) became widespread, together with an interest in establishing the synchronicity of rulers and events. Timaeus (mid-4th century–late 260s BC) constructed a synchronous list of Olympian victors, Spartan kings and ephors, Athenian archons, and priestesses of Hera; thereafter it became customary to date historical events in a longer perspective by years of the Olympic Games, i.e. by Olympiads. Eratosthenes in the 3rd century BC further refined these lists and replaced a mythical prehistoric chronology with one based on what was believed to be the historical date of the fall of Troy (1183/82 BC). Other eras were also used, notably one calculating from the foundation of Rome (753 BC).

In the Byzantine world several systems of dating were in general use for short-term perspectives. Events could be dated by eponymous years (referring to an individual's holding of a particular office). These could begin and end at any point in the solar year: they included the regnal years of Byzantine emperors and foreign rulers, patriarchs of Constantinople, Alexandria, Antioch, or Jerualem, popes of Rome, etc. Until the 7th century AD dating was also by consulships, with each year named after one of two consuls appointed (with diminishing regularity) annually on 1 January. Numbered indiction years, within a 15-year cycle, were also used, though the indiction cycles themselves were not numbered. Events could also be dated by major natural phenomena, such as earthquakes, eclipses, and the appearance of comets. On a larger scale, dating by Olympiads continued, and also by local eras such as the Antiochene (starting from 49 BC). The *Chronicle* of Eusebius (2nd edition, AD 325) presented an influential synchronous table of world history from Creation with a Christian perspective. However, the most widely used dating reference came to be the so-called Byzantine era, from the date of Creation; the latter was arrived at by extrapolating back-

wards from the year of Christ's death and resurrection through the recurring synchronicity of the lunar cycle (19 years) and the solar cycle (28 years), making a combined cycle of 532 years. Until about the 9th century AD chroniclers and historians noted events by a multiplicity of overlapping systems; thereafter the regular dating method was by years from the Creation (normally deemed to have taken place 5,508 years before Christ's incarnation). Such dates are conventionally known as Year of the World (Anno Mundi; AM). Dating from the incarnation (Anno Domini; AD) was devised by the Scythian monk Dionysius Exiguus in the early 6th century, but did not come into use in the Greek world until late in the Byzantine period and was not widespread until long after the fall of Constantinople.

Chrysaphes, Manuel

Musician of the 15th century

Manuel Chrysaphes was undoubtedly the outstanding member of the Byzantine empire's last generation of church musicians. What little is known of his career as a cantor, composer, theorist, and scribe has been gleaned primarily from the brief notes attached to his compositions in musical manuscripts. These reveal that he was a *lampadarios* (a soloist and choir leader) among the "royal clergy" of the last Byzantine emperor, who also commissioned several of his works. Leaving Constantinople after its capture by the Turks in 1453, he continued to compose for the Orthodox Church in Serbia, Sparta, and Venetian-controlled Crete. Scholars have identified four codices written by Chrysaphes, three of which are in musical collections now on Mount Athos: the Kalophonic Sticherarion (MS Iviron 975, a collection of florid hymns for the Liturgy of the Hours which, according to Gregorios Stathis, predates 1453); the Akolouthia (MS Iviron 1120 ("1458"), an important anthology containing the autograph of his theoretical treatise *On the Theory of the Art of Chanting and on Certain Erroneous Views that Some Hold about it*); and the Kalophonic Sticherarion (MS Xeropotamou 270, dated by Stathis to some time shortly after the fall of Constantinople). The fourth and presumably the latest of Chrysaphes's autographs is the MS. Istanbul Seraglio 15, a copy of the *Grammar* of Moschopoulos dated July 1463.

A highly versatile and prolific composer, Chrysaphes contributed both original melodies and arrangements of pre-existing chants to nearly every genre of Byzantine liturgical music. For the three Eucharistic liturgies of the Orthodox Church he composed many settings of their more solemn chants, including music for the ordinary and festal Trisagia ("Holy God", "As many as have been baptized", and "We venerate Your Cross"); music in all eight modes for the Alleluia sung before the Gospel; multiple settings of the offertory chants "We who represent the Cherubim" and "Now the powers of Heaven"; and communion verses for ordinary weekdays, Sundays (in all eight modes), and the feasts of the liturgical year. Representing a variety of styles, these works range from elegant reworkings of traditional melodies – e.g. the *Dynamis* on fol. 491 of MS Iviron 1120, which is based on the standard Trisagion for hierarchical liturgies – to sprawling compositions in the highly embellished "kalophonic" idiom pioneered by St John Koukouzeles.

Chrysaphes's music for the Eucharistic liturgies is complemented by a much larger body of psalmodic and hymnodic chants for the morning and evening offices of the Byzantine monastic rite of St Sabas. For the festal psalms of these services, Chrysaphes followed the late Byzantine custom of composing elaborate settings, often extended through musical and textual troping, of selected verses with their refrains. These would have been performed alongside anonymous traditional melodies and settings by other composers during the chanting of such psalms as 1, 2 , 3, and 103 at Vespers and 134, 135, and 136 at Matins. Falling outside the normal cycle of office psalms is Chrysaphes's moving lament for the fall of Constantinople, "O God, the nations have come into your inheritance", a setting of selected verses from Psalm 78 included by the composer in his autograph Iviron 1120. Other psalmodic chants from the same manuscript not belonging to the central repertory are found in his redaction of the "Service of the Furnace", a liturgical drama relating the story of the three children in the fiery furnace from the Septuagint book of Daniel that was performed on the Sunday before Christmas. Like his other settings of psalms and canticles, Chrysaphes's chants for this drama show the same stylistic diversity as his melodies for the Eucharistic liturgies. In contrast, although they continue to reflect a mix of old and new material, nearly all the hymns that Chrysaphes composed for the Byzantine offices are cast in the florid kalophonic style. Many are arrangements of traditional hymns appearing in the printed service books of the modern Orthodox Church, while others are set texts by such late Byzantine hymnographers as Nikephoros Xanthopoulos and St Mark Eugenikos of Ephesus. Like St John Koukouzeles and John Kladas, Chrysaphes also composed melodies for his own liturgical poetry, including approximately 20 poems in 15-syllable verse.

Innovations of a rather different sort were recently discovered among Chrysaphes's settings of kalophonic *stichera* (short hymns) by Stathis, who noted brief two-part passages in his autograph MS. Iviron 975. These would seem to suggest that some of the hymns were performed in a simple two-part style, presumably derived from the late medieval Italian practice of so-called "primitive polyphony". Such a style of composition was in fact occasionally employed by his predecessor Manuel Gazes and his contemporary John Plousiadenos, both of whom wrote two-part works. Polyphony, however, is never mentioned in Chrysaphes's treatise *On the Theory of the Art of Chanting*, which is focused on two issues of Byzantine performance practice, namely the proper realization of Byzantine notation and the execution of modulations. Regarding the first of these, Chrysaphes insists that rendering the intervallic neumes of a chant accurately is only a preliminary step towards a stylistically correct performance, the achievement of which depends on the singer's recognition and idiomatic realization of melodic patterns (*theseis*). The remainder of the treatise is devoted to an extended discussion of the Byzantine signs of modulation (*phthorai*) that remains frustratingly obscure because the exact tunings of the modes are never mentioned.

Throughout the period of Ottoman domination the musical works of Chrysaphes were frequently anthologized. Highly influential as models for post-Byzantine composers, these chants were subjected to melodic elaboration through a process of written and oral realization known as *exegesis*. At the beginning of the 19th century Chourmouzios the Archivist employed *exegesis* to transcribe in 17 volumes the complete works of Chrysaphes into the "New Method" of reformed Byzantine notation used by the modern Greek Orthodox Church. Select transcriptions were also made during the period of notational reform by Matthaios Vatopedinos and Gregorios the Protopsaltes, and the latter's florid realizations were published in the Constantinopolitan *Pandekte* of 1850–51. Most recently, Chrysaphes's theoretical writings about *theseis* and modulation have been cited frequently by Western and traditionalist Greek scholars attempting to interpret medieval Byzantine musical notation.

ALEXANDER LINGAS

Biography

Active in the mid-15th century, Chrysaphes was the leading church musician of his generation. He was a choir leader in the service of Constantine XI. Leaving Constantinople in 1453, he continued to compose for the Church in Serbia, the Morea, and Crete. A prolific composer, he wrote for almost every genre of liturgical music.

Chrysoloras, Manuel *c.*1350–1415

Scholar and diplomat

Manuel Chrysoloras played a significant role in the development of Greek studies in Italy during the early Renaissance. A personal friend of the learned Byzantine emperor Manuel II Palaiologos (1391–1425), Chrysoloras was a member of the close circle of intellectuals that the emperor headed in Constantinople. Unusually for a Byzantine intellectual, he possessed a knowledge of Latin which made him invaluable as an ambassador to western Europe. Between about 1390 and 1415 he visited Italy, France, England, Spain, and the Holy Roman empire, in the hope of persuading their rulers to send military assistance to the beleaguered Byzantine empire against the Ottoman Turks. His ceaseless diplomatic activities may explain why, unlike other members of Manuel II's circle, his literary output was limited and unoriginal. His best-known work is *A Comparison of the Old and New Rome*, a discussion of the relative merits of the cities of Rome and Constantinople.

Yet it was as a result of a diplomatic mission that Chrysoloras came to have such an impact on Greek studies in Italy. In 1391, while in Venice, he gave some lessons in Greek to a certain Roberto Rossi, who then passed an enthusiastic account of his teacher to Coluccio Salutati, the chancellor of Florence. So impressed was Salutati that he decided to secure Chrysoloras's services, and in 1396 invited him to teach grammar and Greek literature at the University of Florence. Chrysoloras occupied this post only between 1397 and 1400, but in that period had a tremendous effect, prompting the Florentine historian Leonardo Bruni to claim, with only slight exaggeration, that Chrysoloras had singlehandedly revived in Italy the study of Greek letters that had been dead for 700 years. Among his pupils were numbered some of the foremost figures of the revival of Greek studies in Renaissance Italy, including Bruni himself, Guarino da Verona, and Palla Strozzi.

Chrysoloras's success in stimulating a revival in Greek studies and in imparting his knowledge so widely arose from his novel teaching methods. He carefully graded the authors that his pupils studied, beginning with prose authors before moving on to the poets, and among the poets beginning with Homer before passing to other epics, tragedies, and comedies. He was also able to simplify Greek grammar, his approach being later encapsulated in his textbook entitled *Erotemata* or "Questions", which cut through many of the complexities presented in traditional Byzantine grammar books. The *Erotemata* was translated into Latin by Guarino and was one of the first books to be printed in Italy, around 1471. Chrysoloras's methods and textbook placed the Greek

EMANVEL

Manuel Chrysoloras, a 16th-century engraving

language within the grasp of any keen and intelligent student, and some of his pupils were able to achieve a high degree of competence in only a year.

He also helped to make Greek literature better known in Italy in his activities as a translator. Along with Uberto Decembrio (d. 1427), he produced a Latin translation of Plato's *Republic*, a version that helped to stimulate the first awakening of interest in Plato's political thought in Italy. The success of Chrysoloras's translation was undoubtedly helped by his method, which was to abandon the word-for-word approach of previous translators in favour of a version that conveyed the spirit of the text and which had some literary merit in Latin, while at the same time avoiding an over-free rendering. His method was subsequently adopted by the Italian humanists as the standard approach to Greek translation, and inspired a generation of Italian scholars to produce new Latin versions of Aristotle to replace the old scholastic texts.

Chrysoloras left Florence in 1400, and after spending time in Pavia and Milan, where he may have continued his teaching, he returned to Constantinople in 1403. His later career was devoted to diplomacy rather than to teaching, although he may have done something to stimulate Greek studies in France when in 1408 he presented a codex of the works of Dionysius the Areopagite (now in the Louvre, Paris), to the abbey of Saint-Denis on behalf of Manuel II. It was on a diplomatic mission that he died in 1415 while representing the Byzantine emperor at the Council of Constance.

Yet although Chrysoloras's teaching career in Florence had been brief, it was to have a significant impact in the long term, largely thanks to his pupil Guarino da Verona. Guarino followed Chrysoloras back to Constantinople in 1403 and remained there until 1408, acquiring a thorough grounding in the Greek language and Classical Greek literature. On his return to Italy, he became one of the foremost teachers of Greek, able to present Classical texts to Italians in a form in which they could be readily understood. In 1452, long after Chrysoloras's death, Guarino compiled the *Chrysolorina*, a collection of letters and texts that bore witness to the esteem in which his master had been held, and which constituted an act of homage to the man who was credited with having revived Greek studies in Italy.

JONATHAN HARRIS

Biography

Born *c.*1350, Chrosoloras was a friend of the emperor Manuel II Palaiologos who sent him on numerous missions to western Europe. He taught Greek at the University of Florence from 1397 to 1400 where his pupils included Guarino da Verona. Guarino did much to promote Greek studies in Italy and translated Chrysoloras's Greek grammar into Latin. Chrysoloras died at the Council of Constance in 1415.

Church–State Relations

The relationship between Church and state in Greece is a matter of great importance with a long historical tradition. In order to understand, for example, the contemporary relations between Orthodoxy and politics – or more broadly the crucial role played by the Orthodox tradition in Greece – one has to

take into consideration the specific sociopolitical developments since early Byzantine times. Before the Byzantine era, however, early Christian attitudes towards the Roman state and its power were far from consistent. Jesus Christ distinguished clearly between the "things of Caesar" and "the things of God" (Matthew 22: 21), while Paul (Romans 13: 1) admonished Christians to obey the governing authorities, because these derived their authority from God. On the other hand, Peter (Acts 5: 29) opined that in certain issues Christians must obey God rather than men. A radical and total negation of the state is also found in the book of Revelation. These cases reveal that Christianity was not altogether conservative in sociopolitical matters, but placed religious authority above all mundane powers. This is more apparent in the cases of numerous martyrs, who preferred to die rather than betray their Christian faith. Early Christians generally chose to remain loyal to the political authorities, but not when vital issues of their Christian identity (e.g. their radical monotheism) were at stake.

Byzantium, the New Rome, inaugurated a new chapter in Church–state relations when its founder, Constantine I (324–37), initially declared Christianity de jure as a *religio licita* and further as the official religion of the Roman state. Constantine's role, the political liberation he brought to the persecuted Church, and its public patronage were emphasized by Eusebius of Caesarea. Apart from occasional conflicts and matters of dispute, there always existed a very close collaboration between Church and state, between the *sacerdotium* (priesthood) and the *imperium* (imperial state), which was legally and religiously legitimized and stabilized, especially during the reign of Justinian I (527–65). On the basis of this mutual understanding, the Church commanded allegiance to the state, legitimized it, and tried to serve its goals – though usually not when matters of faith were at stake. On the other hand, the state protected the Church's interests and contributed to the solution of its problems (e.g. of dogmatic disputes through the summoning of Church councils). According to the principle of "symphony" (*consonantia*), both Church and state as a single organism affirmed that they had the same *Kyrios* (Lord), Jesus Christ. Neither of these two parties was the loser from this longstanding connection, which found its clear expression in Byzantine political ideology. The strength of the Byzantine empire and the culmination of its power were also attributed to this strong collaboration. The Byzantines generally felt superior to other people due to their Orthodox faith.

An area of dispute in modern scholarship concerning Byzantine Church–state relations has to do with the issue of Caesaropapism, i.e. the total subordination of the Church to the will of the emperor, who allegedly enjoyed unlimited rights over it. This was thought to be the outcome of the Church's submission to the imperial system and its bureaucracy. Yet the term "Caesaropapism" does not depict accurately the specific Byzantine situation. The political and religious authorities remained clearly distinguished, and the emperor never undertook the role of patriarch. Emperors could exert considerable influence upon the external affairs of the Church (e.g. on financial and material issues), but not on internal, theological issues, as the longstanding disputes over iconoclasm and the union of the Churches show. On the other hand, the Church, despite its strong connection with the state, tried through various means to preserve its autonomy, while in certain cases its ideological power was enormous and could even influence state legislation decisively. It is also important to note that the Byzantine model of Church–state relations has left its indelible mark upon Eastern Christendom, including Greece, and continues to function as an ideal pattern for the whole of society to imitate.

After the fall of Byzantium substantial changes occurred to existing Church–state relations. The Orthodox Church, due to the privileges bestowed upon it by the sultans, became the only Byzantine institution that survived the fall and continued to exist within the Ottoman empire. The patriarch of Constantinople became the leader of the entire Orthodox *millet* (community), to which not only Greeks belonged. Thus, during the long Ottoman domination (1453–1821) the Church acquired several other jurisdictions (e.g. in legal, educational, social, and political matters) far beyond the strictly religious domain. The gradual increase of its functions led to the transformation of the Church into a religio-political institution. Such a change implied a considerable strengthening of its social influence, which was naturally underscored by its own values and mode of thinking. Though the Church tried to preserve its traditional supranational role, it also provided a shelter for the preservation of various ethnic-cultural identities in the Balkans, including the Greek one, from the inroads of Islam and western propaganda. Orthodoxy was thus transformed into a crucial factor in the articulation of modern Greek identity. Nonetheless, the main challenge to the Church's supremacy came with the Greek Enlightenment of the late 18th century onwards, when demands were voiced for the limitation of the Church's broad influence and the concomitant differentiation of society.

This demand, however, was forcibly realized after the foundation of the Greek state during the reign of the young Bavarian king Otho (1833–62). This marked the beginning of a vigorous secularization process in an attempt to limit the jurisdiction of the Church solely to the religious domain and to foster the functional differentiation of the various societal sectors (e.g. law, administration, education). Thus, the autocephalous Church of Greece was unilaterally declared in 1833 through a split from the patriarchate of Constantinople, was totally subjected to the state, and was controlled by a government procurator. These and other developments (e.g. the closing of numerous monasteries and the confiscation of their property) caused a reaction among many Orthodox believers and led to a worsening of the Church's situation during the 19th century. Despite these difficulties, the ideological power of the Church was still left untouched, and it was able to adjust to the new situation by supporting wholeheartedly Greek nationalism in the frame of the "Great Idea". This meant also its transformation into an organ of the state and into a purely national Church, which signified the unavoidable end of Orthodoxy's previous supranational tradition in the east. Apart from this, from the 19th century onwards an entire mythology was created to support the diachronic correlation and ideal synthesis of Hellenism and Christianity throughout history. All these factors attest to the new opportunities offered to the Church to retain its pivotal role within Greek society.

The Church's overall situation was later impoved substantially during the reign of king George I (1863–1913). The

constitution of 1864 gave greater freedom to the Church, while state legislation catered for the amelioration of the pecuniary condition of the clergy and the parishes. The Church, however, still remained dependent on the state at many levels and was thus affected by political corruption, factional rivalries, and multifaceted, intertwined interests. The political scandal of the *Simoniaka* (1874–78) and the gospel riots (*Evangeliaka*) of November 1901 demonstrate the interplay between religion and politics in this period. The same can be observed later when during World War I Greece was divided between the followers of the prime minister E. Venizelos and the followers of king Constantine I. The Church was divided too, and its royalist faction anathematized Venizelos in 1916 when the latter established a provisional government in Thessalonica. The dependence of the Church on political developments continued to exist even later, for example during World War II and the ensuing Civil War (1946–49), whereas the dictatorship of 1967–74 created a major internal split within the body of the hierarchs, whose repercussions in various domains have dogged the Church until now.

An important development in Church–state relations was the legal recognition by the Greek parliament (Law 590/1977) for the first time of the Constitutional Charter of the Church of Greece, published in the *Government Gazette* (Issue 146 of 31 May 1977). This marked the beginning of a new era in the relations between these two major institutions, which moved to the status of mutual alliance and collaboration in various domains. It was also stated that the administration of the Church would be free from state intervention, especially with regard to the election of the archbishop, in which there had been constant interference throughout modern Greek history. Yet various problems and contentious issues in Church–state relations have appeared in recent years too. Among the most hotly discussed matters were the following: the issue of "the automatic divorce", i.e. divorce on the grounds of long separation; the introduction of civil marriage as equivalent to the religious one; the nationalization of ecclesiastic and monastic property; the legalization of abortion; the depenalization of adultery; the compulsory record of religious affiliation on identity cards for all Greek citizens; the consequences of the Schengen Treaty; the revision of the constitution regarding religious freedom and the rights of religious minorities; and finally, the major "ecclesiastical problem" referring to the deposition of 12 metropolitans in 1974 by archbishop Serapheim, their later attempts at reinstatement through civil and other means, and the concomitant violent conflicts in some dioceses (1989–98).

In order to understand these problems between Church and state, it is vital to consider first that the Greek state is in principle a modern, secular institution, which belongs to the European Union, collaborates with all major international fora, and tries to conform to transnational regulations. At the same time, it is deeply influenced, both explicitly and implicitly, by the predominant Orthodox tradition, which it uses for various purposes (e.g. national) in the present globalized environment. But Orthodox doctrine, considered as the only true revelation of God, is in many cases out of line with the exigencies of a modern state and its policies of assimilation and adaptation to the world system. The lack of balance between these two situations creates occasional problems that spoil the apparently smooth surface of Greek Church–state relations.

It is quite characteristic of both that neither the state nor the Church wants to terminate their close connection and collaboration, though they have occasionally declared that such a development would perhaps be beneficial for both of them. The PASOK party in its founding manifesto of 1974 promised that it would implement a complete administrative separation of Church and state, a pledge that has not been fulfilled, although PASOK has sought looser ties with the Church. Especially after the collapse of communism in eastern Europe, where the Orthodox Church traditionally had firm footholds, the consequent revival of Orthodoxy there, and its active reappearance in political life, visions of a prospective separation between Church and state in Greece have almost completely vanished. After all, such a development would certainly be against the demands of the times. From this point of view, it can be said that in Greece Church–state relations have reached a normal level of compromise and coexistence. There is a single Ministry of Education and Religious Affairs, and the Church functions as a legal entity in public law. Needless to say, there exist several areas of overlapping interest between Church and state (e.g. in the civil code, and the finances of the Church). Finally, the Constitution of 1975/86, beginning with an invocation of the Holy Trinity, acknowledges the privileges of the Eastern Orthodox Church as the "dominant, prevailing religion" on Greek territory.

In this context, it is not surprising that Orthodoxy is very often used by the state and various politicians for a number of purposes (e.g. as an ideological tool for social control and cohesion, as a mechanism against acculturation and for social integration, as a decorative element in ostentatious ceremonies, and as a means for the worldwide promotion of Hellenism). This signifies that Orthodoxy is an indispensable element in the Greek sociopolitical system. Suffice it to say that the archbishop of Greece can become at turbulent historical moments the "ethnarch", i.e. both political/national and religious/spiritual leader of the Greek *ethnos* (nation). One example was when archbishop Damaskinos Papandreou became also viceroy (1944–46) and prime minister (1945). This is indicative of the strong interpenetration between the religious and the political spheres in Greece. In addition, the overwhelming majority of Greeks, though indifferent and sometimes very critical towards the Church, do not generally favour its separation from the state. Instead they support the improvement of their relations, because they think that the Orthodox Church has played a pivotal role for the Greek nation in the past. Thus, Orthodoxy prevails today in Greece largely because it is closely related to the ethnic and cultural identity of the people, a fact that influences decisively the positive attitude of most political parties towards the Church.

Generally, it seems that Church–state relations in Greece are paradoxical and even contradictory in certain ways, but this situation has a plausible explanation. If one may use a revelatory metaphor, Church–state relations in Greece resemble very closely the life of a married couple who have problems, but are not yet divorced. Both spouses continue to live together, follow their own life-styles, and collaborate on issues of common interest and profit. At the same time, they do not share a bedroom, occasionally have serious quarrels, and threaten to

sue for divorce. But these threats remain solely verbal and both parties prefer to continue the status quo for practical reasons. It goes without saying that this situation is far from ideal and constitutes a tenacious source of problems for Church and state alike.

Cilicia

Region of southern Asia Minor

Cilicia commonly (but not invariably) names the area of southern Turkey bounded by the river Melas (Turkish Manavgat) to the west, the Taurus to the north, the Amanus as far south as Cape Rhosus (Hınzır Burnu) on the gulf of Issus to the east, and the Mediterranean to the south.

West of the river Lamus (Lamas) Cilicia is mountainous and the coastline mainly abrupt; it was named "rough" (Greek Tracheia); to the east as far as the Amanus it is a fertile plain (hence Greek Pedias). The mountainous mass of Rough Cilicia, jutting out into the sea, threatening not only Pedias but also the Pamphylian plain to its own west, difficult to penetrate or pacify, is a defining feature of Cilician history. Another is the location of Pedias on a main land route between east and west.

The Cilicians were an Anatolian people; Hittite and neo-Hittite sites have been uncovered (strikingly at Meydancık Kale near Gülnar and at Karatepe). Greek settlement began in the Archaic period at coastal sites in Tracheia (e.g. Kelenderis, Nagidus, Soli). Later legend attributed some native cities (Mallus, Mopsuestia, Olba, Tarsus) to Greek foundation in the heroic age. What history underlies this is obscure; a name resembling Mopsus (who figures in the legends) is borne by an ancestor in a royal inscription of the 8th century BC at Karatepe.

There were native kings at Tarsus under the Persians until the early 4th century BC. After Alexander's conquests control was disputed by the Seleucids and the Ptolemies. At first the whole was probably Seleucid; two of Seleucus Nicator's lasting monuments, Seleucia ad Calycadnum (Silifke) and the temple of Zeus at Olba, are in Tracheia. But by the middle of the 3rd century Tracheia had Ptolemaic garrisons which were ejected in 197 BC.

Seleucid weakness resulted in the pirate "kingdom" in western Tracheia around 140 BC. With the connivance or tolerance of other states the pirates grew in strength; only in 101 BC was a Provincia Ciliciae (which did not include Cilicia) created by Rome to deal with them. For the next 30 years efforts were unsuccessful. Meanwhile in 83 BC Pedias was conquered by Tigranes of Armenia. A pirate raid on Ostia in 68 BC provoked a decisive response from Rome in the appointment and successful campaign of Pompey the following year. Tigranes also withdrew from Pedias. Pompey resettled pirates in the cities of Pedias and eastern Tracheia (including Soli, refounded as Pompeiopolis) and organized Pedias as a group of city states; rougher territory to the east was handed to a local dynast, Tarcondimotus. A policy of leaving such territory to clients endured until the Flavian period.

The Provincia Ciliciae of 64 BC extended beyond Cilicia proper. Between 58 and 47 BC it included Cyprus, and between 56 and 49 BC stretched to Phrygia. Around 44 BC Pedias became part of the province of Syria. Soon after, Tracheia (excluding the free city of Seleucia) was given to Egypt. It remained under client kings for about a century after Actium (Amyntas of Galatia to 28 BC, Archelaus of Cappadocia and his son, also Archelaus, to AD 38, and finally Antiochus IV of Commagene to AD 72). The kingdom of Olba in eastern Tracheia remained under the native dynasty until AD 41 when it was given to Polemo II of Pontus. A number of cities of Tracheia were founded in this period, perhaps with civilizing intent; Titiopolis and Domitiopolis probably by Cleopatra; Iotape, Irenopolis, Germanicopolis (still Turkish Ermenek), and Philadelphia by Antiochus IV; and Claudiopolis (Turkish Mut) by Polemo II. Two uprisings by the tribes (in AD 36 and 52) were serious enough to be recorded by Tacitus and needed Roman troops for their suppression.

In AD 72 Vespasian deposed Antiochus IV and united Pedias and Tracheia (except its western fringe) in a single province of Cilicia. Then they were divided again (perhaps in the mid-2nd century). Tracheia was thenceforth known as Isauria. In the second half of the 3rd century there were uprisings of the Isaurians and invasions by the Persians who in 260 advanced as far as Corycus and subsequently as far as Selinus. In the Diocletianic reform the province of Cilicia was subdivided, with Cilicia I having its capital at Tarsus and Cilicia II at Anazarbus. Both Cilicias and Isauria were part of Oriens and later were ecclesiastically subject to Antioch.

In 353 the Isaurians attacked Lycaonia and Pamphylia, in 354 Palaeae and Seleucia, in 368 Pamphylia again, in 400 Syria and Palestine. Sites were fortified (e.g. Anemurium in the 380s, Korasion around 370, and the shrine of St Thecla near Seleucia by 384); Isaurian fortresses were captured and regarrisoned without effect. There are vivid glimpses of these troubles in the 5th-century Miracles of St Thecla.

Zeno, an Isaurian who had become a favourite and son-in-law of Leo I, became emperor in 474. His rule was marked by civil wars, two of which in 474–76 and 483–88 took place in Cilicia. Zeno attributed his success in the first to St Thecla and rebuilt the sanctuary. What of the little that survives is Zeno's has been debated; the suggestion that some of the splendid churches still standing in eastern Tracheia (e.g. at Alahan, Canytela, Corycus, and Dag Pazarı) belong to Zeno's reign, on the grounds that the flow of patronage ceased afterwards, is plausible. The Isaurians were reputed as masons; they are later recorded at St Saba, St Symeon Stylites, and Hagia Sophia. Isaurian power ended with Zeno in 491. The Isaurians took on Anastasius and lost; reduction of their fortresses took seven years.

Cilicia: the land castle at Kizkalesi, built in the 12th century when the area was part of the Cilician kingdom of Armenia

Cilicia was lost to the Persians between 613 and 629. The Arabs first reached Tarsus (which its inhabitants abandoned) in 637, the first invasion of many throughout the century. Pedias remained nominally Roman till the beginning of the 8th century. Thereafter the frontier moved west to the Lamus and, despite raid and counter-raid, remained stable for more than two centuries. The devastation of these wars in Pedias is obvious; there are almost no standing remains from antiquity (Tarsus was described as in ruins in 778). By contrast in Tracheia urban life seems only gradually to have petered out; its subsequent depopulation has left a very rich collection of monuments.

The Byzantines recovered Pedias in 950 and retained it for little more than a century. After Manzikert they had to compete with other contenders (the Turks, the crusaders, and the Armenians). The Byzantine campaigns of 1137 and 1159 had shortlived effects and by the third quarter of the century their power had melted away. Cilicia now belonged to the Armenians but did not long remain at peace. Raids by the Mamluks began in 1266 and continued with devastating effect till their final conquest in 1375. Cilicia became wholly Ottoman in 1515.

The 19th century saw Greek immigration from Cappadocia, Cyprus, and the Aegean. Near its end Cuinet counted 46,200 Orthodox Greeks in a population of 403,439 (of whom 173,389 were Christians) in the vilayet of Adana (which covered Cilicia). Those remaining in the French zone (covering Pedias) were evacuated in November 1921 after the French agreement with Angora. The treatment of those under Turkish rule further west was less ordered; by 1923 they too had all gone.

GEORGE LEMOS

Summary

A region of southeastern Anatolia, the coast of Cilicia was settled by Greeks in the Archaic period. After Alexander's conquests it was disputed by the Seleucids and Ptolemies. A Roman province of Cilicia was created in 101 BC, part of which remained nominally Roman until the 12th century – the Byzantines reconquered it from the Arabs in 950 but lost control to the Turks by the later 12th century.

Cimon *c.*510–*c.*450 BC

Athenian aristocrat

Cimon has not been as well served by ancient tradition as some of his slightly older or younger contemporaries, because his era of dominance at Athens fell slightly after Herodotus' period of focus, but slightly before that of Thucydides. Plutarch's *Life of Cimon*, which contains most of what we know of him, is much shorter than his *Lives* of Themistocles or Aristides. Although Plutarch did not lack sources, it is evident that Cimon's personality did not generate as much interest in later generations as those of his more intriguing adversaries Pericles and Themistocles.

A relative of Thucydides, Cimon was from a very distinguished Athenian family, the Philaidae. He was the son of one of its most distinguished members, Miltiades, who, as ruler of the Chersonese, had promoted Athens' colonial ambitions keenly until his support for the Ionian Revolt so angered the Persians that he was forced to escape to Athens (493 BC). The climax of his career was his generalship at the Battle of Marathon (490 BC), but his subsequent campaign against Paros for its Persian sympathies was a failure. At the instigation of Pericles' father Xanthippus, he was fined 50 talents, but died from a battle wound before he could pay it. Cimon inherited not only his father's debt, but also his policies of hostility to Persia and Athenian imperial expansionism.

After an impressive performance at Salamis, Cimon was made an Athenian envoy to Sparta in 479 BC, and his name is associated with the most important campaigns of the early Delian League, from 478 BC to 463 BC, working with its organizer Aristides, who is said to have championed the young Cimon as his ally against Themistocles. In 478 the Spartan general Pausanias was still in charge of the Greek forces, but according to Athenian tradition his arrogance began to alienate them, and they were won over by the kindness of the Athenian generals. Once the Spartans recalled Pausanias on a charge of treason, control over the anti-Persian operations was definitively ceded to Athens, thereby laying the foundations for Athenian dominance over the Aegean during the 5th century BC. Acquitted, Pausanias took Byzantium, but he was driven out by Cimon himself, who then triumphed in his father's old stamping ground by removing Eion in Thrace from Persian hands (476/75 BC). Soon after this, he won Scyros for Athenian colonists and, in an effective personal coup, returned the alleged bones of Athens' national hero Theseus to the city for burial, to great acclaim. Sources do not explicitly say that he led the early campaigns of the league to crush allied rebellion, at Carystus and Naxos (473–469 BC), but his usual enthusiasm for Athenian expansion makes his presence there very likely.

Soon after Naxos the Athenians undertook a major campaign in the southeast Aegean, perhaps to mollify allied discontent at their use of the league to police its own members. Cimon's greatest triumph followed at Eurymedon in Pamphylia (*c.*468 BC), when his troops wiped out the Persian fleet, and cities as far east as Phaselis joined the league. His generalship brought material wealth to Athens, and an immense sense of pride to a city that had been sacked by the Persians only some 12 years earlier, but was now carrying vengeance right into the Great King's territory. Cimon's comprehensive victory may be said to have paved the way for the Peace of Callias, *c.*450 BC, whereby Greek freedom from Persian interference was finally secured.

At this time, however, Cimon continued to pursue the Persians relentlessly, returning to the Chersonese and driving out those who remained, before besieging the Thasians who had now seceded from the league (465–463 BC). The Spartans, actively working against their former allies in the Persian Wars, had promised the Thasians that they would help them by invading Attica, but an earthquake and a helot revolt frustrated this plan. Meanwhile, Cimon crushed Thasos and returned to Athens, to be prosecuted (unsuccessfully) by the up-and-coming Pericles on a charge of bribery for having made no territorial gains in Macedonia. Unlike Pericles and others, Cimon clung to the old view that Sparta was Athens' partner, not its rival in Greek leadership (in spite of his service in the expansionist Delian League), and in 462 BC he persuaded Athens to help the desperate Spartans. It was perhaps while he was away that Ephialtes introduced the democratic reforms that took most jurisdiction away from the Areopagus and gave it to the people's courts instead: whether or not this was the cause, the Spartans decided that the Athenian army could not be trusted not to help the helots, and sent them away. This ignominious dismissal severely damaged Cimon's credibility in Athens, and, after a failed attempt to reverse Ephialtes' work, he was ostracized in 461 BC. Athens also broke irrevocably with Sparta by allying with its enemy, Argos.

Cimon's next known action was to patch up relations between Athens and Sparta with a five-year truce, *c.*451 BC. The two cities had been testing one another's strength throughout the decade, at the battles of Tanagra (won by Sparta) and Oenophyta (won by Athens), and after the loss of 200 Athenian ships in Egypt in 454 BC, both sides were ready for a brief respite. It seems clear that Cimon still hankered after the past when Sparta was an ally, not an enemy, and his last campaign was also a throwback to the 470s BC. He mounted another expedition to Persia to recapture Cyprus, but he died there, and aggressive Athenian expansion in the east ceased thereafter.

The sources, perhaps derived from Critias, say that Pericles instituted jury pay in order to counter Cimon's personal generosity. Cimon's family was wealthy anyway, and his huge campaign revenues brought him popularity as he opened up his estates to the poor, and gave them public dinners and financial handouts. Payment became necessary after the Ephialtic reforms, which brought a greater volume of business to the democratic courts, so that larger issues of practicality rather than small-scale politicking may have caused Pericles' move,

but it is certainly true that Pericles opposed the traditional, almost feudal patronage practised by those from rich families, such as Cimon's, because this was damaging to democracy. A number of artefacts associated with Cimon indicate that he was keen to assert himself in a traditionally aristocratic manner: the Painted Stoa, commissioned by his brother-in-law, bore a picture of Marathon in which Miltiades was prominent, and a Delphic dedication associated a statue of Miltiades with those of Athena, Apollo, and the Athenian tribal heroes. By rehabilitating his father, Cimon augmented his own status as the inheritor of Marathonian glory over that of Themistocles, whose victory had been Salamis.

There is, therefore, some truth in the schematizations of later sources that pit Cimon the conservative against Pericles the democrat. His foreign policy was conservative in that it was based on traditional Greek affiliations at a time when new alignments were beginning which would lead to the Peloponnesian War. The names of two of his sons – Lacedaemonius and Eleius – are revealing. In other ways, however, he was as imperially minded as Pericles, leading the campaigns that created the Athenian empire, encouraging the Athenian naval activity that later writers associate with radical democracy, and vigorously opposing secession from the league. Both he and Aristides, though not as brilliant as Themistocles, played a huge part in the creation of 5th-century democracy.

SOPHIE MILLS

Biography

Born *c.*510 BC to a noble Athenian family, Cimon was the son of Miltiades, ruler of the Thracian Chersonese. As a general he actively pursued the war against Persia but was keen to retain Sparta as Athens' partner, not rival, in leadership of Greece. He was ostracized in 461 BC but recalled in 451 to mend fences with Sparta. He died soon after in Cyprus, attempting to recapture that island from Persia.

Cinema

Cinema in Greece, as a form of mass popular entertainment, is largely a postwar phenomenon, although a tradition of Greek film making can be traced back to the early decades of the 20th century. The first Lumière films were shown in central Athens in 1897 to a mixed public response: members of the audience reportedly fainted, while others threw stones at the screen. Nevertheless, a cinema was established in the capital several years later.

The first full-length feature film to be made in Greece was a bucolic romance entitled *Golpho* (1914) by Kostas Bachatoris, which was adapted from the popular play by Spiridon Peresiadis and premiered at the Pantheon cinema on 22 January 1915. *Golfo* was followed in the same year by Michalis Glitsos's adaptation of Konstantinos Christomanos's Athenian novel *I Kerenia Koukla* (Waxen Doll, 1911), again starring Verginia Diamanti in the leading role.

Documentaries, however, such as those by the Hungarian royalist Josef Hepp, were also produced during this period, notably *The Entry of the Greek Army into Thessalonica* (1912), in which Hepp recorded the Greek military successes of the First Balkan War. The first film made in Greece was a newsreel of the 1906 interim Olympic Games.

In 1927 the DAG production company was formed and produced a number of features, including *Astero* (The Star), the first Greek feature to penetrate foreign markets, appealing, in particular, to Greeks of the diaspora. The director of this film, Dimitris Gaziadis (1899–1965), who went on to make a further five films, had studied in Berlin and later established a school of film making (1928). He was also the author of the first Greek book on cinema entitled *How Can I Act in Cinema?* (1926). In 1932 the first talkie was made by Dimitris Tsakiris, again a romance entitled *Agapitikos tis Voskopoulas* (The Lover of the Shepherdess), based on the play by Dimitrios Koromilas. The Greek film industry, however, lacked sufficient financial resources to rise to the challenge of the new technology and, consequently, few films were made in the 1930s.

World War II and the ensuing German occupation (1941–44), which was followed by the Civil War (1947–49), largely undermined attempts at rehabilitating the film industry in Greece. Despite the political and social turmoil, however, this period did see the founding of a major production company. The rise of the Greek cinema in the postwar years is closely connected to the establishment by the entrepreneur Philopoimin Phinos (1908–77) of the Phinos Films production company, which was launched with the film *Phoni tis Kardias* (Voice of the Heart) in 1943. Phinos Films was self-consciously styled on Hollywood production companies and oversaw production from the initial shooting, through the processes of editing, distribution, and marketing. Phinos produced mainly comedies and melodramas, as well as Hollywood genres such as the musical and the western. Among its greatest successes were the many features starring Aliki Vouyouklaki (1937–96), undoubtedly one of the leading stars of the Greek cinema, who made her debut in 1954 with Nikos Tsiforos's (1912–70) *To Pontiaki* (The Little Mouse), although she came to prominence a year later with Dimis Dadiras's (1927–82) version of *Agapitikos tis Voskopoulas*.

By the mid-1950s numerous films were being produced. These were mainly comedies which drew upon a broad range of Greek comic drama from popular entertainment, such as farce, variety, and the shadow puppet theatre (*karaghiozis*), to Aristophanes. A local star system began to develop during this period which saw the emergence of distinct comic actors such as Vassilis Logothetidis, Kostas Hadjihristos, Dinos Iliopoulos, and Thanassis Vengos (1927–), a self-taught comedian who has made over 110 films, including such hits as *Ti Ekanes ston Polemo, Thanasi?* (What Did You Do in the War, Thanassi?, 1971), and who was introduced to cinema by the director Nikos Koundouros (1926–) after they met in the concentration camp on the island of Makronissos.

Cinema: Alan Bates and Anthony Quinn in *Zorba the Greek* (1964), directed by Michalis Cacoyannis

Two outstanding directors of comedy active during the 1950s were Yorgos Tzavellas (1916–76) and Alekos Sakellarios (1913–92). Tzavellas directed such classics as *O Methistakas* (The Drunkard, 1950), which broke box-office records in Greece, and *Kalpiki Lira* (Counterfeit Coin, 1955), which starred Logothetidis with music by Manos Chatzidakis, and followed the fate of a coin as it passed through a myriad of hands. Among the best-known of Sakellarios's 50 or so films are *Oi Germanoi Xanarchontai* (The Germans are Coming Back, 1947), *Laterna, Phtochia, kai Philotimo* (Barrel Organ, Poverty and Dignity, 1955), and *I Thia apo to Chikago* (The Aunt from Chicago, 1957).

With a few exceptions, the major output of commercial Greek cinema consisted of low-budget comedies and melodramas. These did not evince any degree of experimentation, although the legacy of the war is reflected in the uncomfortable narrative shifts and sometimes hysterical acting. Nevertheless, the early 1950s did see some independent film productions. It was Grigoris Grigoriou (1919–), the director of *Pikro Psomi* (Bitter Bread, 1951), who introduced what is often called "Greek neo-realism" under the influence of the Italian postwar cinema of Roberto Rossellini, Luchino Visconti, and Vittoria De Sica. Neo-realism was a postwar movement that exploited location filming and employed non-professional actors, drawing for its subject matter upon the experiences and struggles of the popular classes.

At the same time, two other independent film makers launched their careers: Michael Cacoyannis (1922–), a Greek Cypriot, with his film *Stella* (1955), which established the career of Melina Mercouri (1923–94), and Koundouros with his film *O Drakos* (The Ogre, 1956, distributed in the UK as *The Ogre of Athens*). Despite such classics as *Stella*, *To Koritsi me ta Mavra* (The Girl in Black, 1956), starring Elli Lambetti, and his screen versions of the Euripidean tragedies *Electra* (1961), *The Trojan Women* (1971), and *Iphigenia* (1977), however, Cacoyannis remains best known today for *Zorba the Greek* (1964), an adaptation of the novel by Nikos Kazantzakis (1883–1957).

It was in the 1960s, however, that film directors such as Alexis Damianos (1921–), Theodoros Angelopoulos (1935–), and Pantelis Voulgaris (1940–), among others, attempted to break with the mainstream commercial film industry and created an *auteur* cinema outside the studio system, in much the same way as the French New Wave had done. The "New Greek Cinema" is a general term often applied to these independent film makers such as Kostas Ferris (1935–), Nikos Nikolaïdis (1940–), Nikos Panayotopoulos (1941–), Yorgos Panoussopoulos (1942–), and Vassilis Vapheas (1944–), who rose to prominence in the 1960s and 1970s, in the wake of innovative films such as *Sky* (1962) by Takis Kanellopoulos (1934–90). The term "New Greek Cinema" itself was coined by the critic Photis Alexiou in a review of a film by Voulgaris and refers to a broad category of films which are intensely concerned with contemporary Greek social issues and with the nation's recent historical experiences of political repression and conflict. Many of the films adopt a critical – even defiant – stance towards authority and in retrospect the "New Greek Cinema" can perhaps best be understood as a reaction to the oppressive 1967–74 dictatorship, as well as an attempt by directors to reflect upon the meanings of Greekness during a period when Greece was increasingly falling under the political and artistic influence of the United States. At the same time, while for the most part it eschewed the narrative techniques of the mainstream Greek commercial cinema, the "New Greek Cinema" found inspiration in the experimentation that characterized European art cinemas. Many of these preoccupations were debated in the pages of the film magazine *Synchronos Kinimatographos*, which was published between 1960 and 1985 and to which Angelopoulos and Voulgaris contributed.

Two films can perhaps be singled out as marking a watershed in Greek cinema of this period: Angelopoulos's first feature film *Anaparastasi* (Reconstruction, 1970) and Damianos's *Evdokia* (1971), the second part of a loose trilogy which began with *Mechri to Ploio* (Until the Ship Sails, 1966) and concluded in 1995 with *Iniochos* (The Charioteer). *Evdokia* is a love drama that centres on the tragic relationship between a sergeant and a prostitute who meet one night in a taverna and who marry after a brief but intense affair. The film charts the break-up of the couple's relationship against a barren, semiurban, Attic landscape. Sensuality and tenderness are consistently juxtaposed against the harsh discipline of the military compound and the film explores the consequences of social marginality, as well as the tensions between repressive middle-class aspirations and freedom.

Notwithstanding the interest which the New Greek Cinema provoked, by the mid-1970s the Greek film industry was in a crisis under the impact of television, together with the commercial successes of Hollywood films. It was partly to bolster independent Greek film makers that the Greek Film Centre was inaugurated in 1970, originally as a subsidiary of the Greek Industrial and Development Bank. It acquired its present name, however, after the overthrow of the Colonels' regime in 1974 and in 1982 the then minister of culture, Melina Mercouri, undertook the promotion of Greek films. A scriptwriting fund was also established. Today many Greek film makers benefit from its coproduction programme and it remains the primary producer of new films in Greece. At the same time the Thessalonica Film Festival, which was founded

in 1960, acted as an important boost for the domestic film industry, bestowing valuable awards. It remains the main annual cinematic event in Greece. In 1981 the running of the festival was taken over by the Ministry of Culture and in 1992 it was transformed into an international event.

Although relatively few films are produced in Greece today and of the 9 million tickets sold in Greece in 1997, only 550,000 were for Greek films, there have been exciting developments in recent years. Following in the path of Tonia Marketaki (1942–94), women directors such as Maria Iliou, Photini Siskopoulou, Angeliki Antoniou, and Olga Malea – whose raunchy feature debut *O Orgasmos tis Ayeladas* (The Orgasm of the Cow, 1996) was a box-office hit – are making their mark. Sotiris Goritsas's *Balkanizateur* (1997), the story of two men's pursuit of fortune in the black-market economies of the Balkans, was another success; between them the films sold some 300,000 tickets. Among promising younger directors, Renos Charalambidis burst on to the scene in 1997 with the prize-winning *No Budget Story*, while Menelaos Karamangiolis's ambitious thriller *Black Out* (1998) won general acclaim.

There is growing interest, too, in the Greek cinema abroad. Greek film has begun to be taught at foreign universities, including Cambridge, where an international conference entitled "Theatres of War: Fifty Years of Greek Cinema" was hosted in 1998. There has been a major retrospective of Greek cinema at the Centre Georges Pompidou in Paris (1995) and retrospectives of Angelopoulos at the Museum of Modern Art in New York in 1990 and at the Riverside Studios in London in 1998. With the support of the Greek Film Centre, a Greek film series was screened at the National Film Theatre in London in 1998.

Cities

What is a city? Is it a community of buildings or a community of people? According to Aristotle, it is not a community of buildings but of people. For one could, for example, "enclose Megara and Corinth in a wall, yet they would not be one city". "But a city", he continues, "is a society of people ... not ... founded for the purpose of men's merely living together, but for their living as men ought" (*Politics*, 3. 9). On the other hand, when Pausanias, the 2nd-century AD traveller, came upon a little place in Phocis, he hesitated to call it a "city" (*polis*) as it possessed "no government offices or gymnasium, no theatre or agora or water flowing down to a fountain" (10. 4. 1). Gradually, "city", which is at the root of the word "civilization" (*politismos*), came to encompass both the buildings and the people of a permanent settlement.

In Mesopotamia evidence of permanent village agriculture dates back to 8000 BC and temple cities and city states date from 3500 BC. In Greece the earliest settlements were the Minoan (2000–1400 BC) and Mycenaean (1600–1050 BC) palace centres. At about 800 BC Archaic Greek societies began developing permanent city structures. While the Greeks did not invent the city as a form, they established it as a political institution. The polis, as an independent city state and a community of self-governing citizens, emerged in the Greek world in the 8th century BC. Its democratic underpinnings, governed by equality of all under the law (*isonomia*), were contrasted with the monarchical and despotic institutions of contemporary cities in Mesopotamia, Egypt, and the Persian empire.

Greek cities originated either from small villages that grew gradually, from several villages that came together to form a community (synoecism), or from colonial settlements. Athens was allegedly formed through synoecism. Colonial settlements, on the Ionian coast (modern Turkey in Asia Minor) and on the south Italian peninsula, were founded for purposes of commerce and retained ties to the mother city in mainland Greece. Many of the new settlements were planned on an orthogonal grid, while cities that evolved over time usually exhibited an irregular, "organic" street plan. Athens, established in Mycenean times, had an "organic" street plan that was first set out in the Archaic period. Miletus, on the coast of modern Turkey, was planned on an orthogonal grid by Hippodamus in 479 BC, following its destruction by the Persians in 490 BC. Though the ancient Greek cities possessed some of the characteristics associated with urban environments today – high concentration of population, division of labour, trade with other cities – they were all heavily dependent on agriculture. The connection of the city to the countryside remained most vital until the 20th century.

Of the approximately 700 cities of the Greek commonwealth in the Classical period, Athens was the largest and most famous. Public life took place in the Agora – the ancient civic centre and marketplace – while the city's tutelary goddess Athena was honoured by the Periclean building programme on the Acropolis: the Parthenon (447–432 BC), the Erechtheum (421–405 BC), and the temple of Athena Nike (427–424 BC). In contrast to the magnificence of the public building programme, residential architecture remained humble and inward looking. In the Classical Greek city no individual, no matter how powerful, could attach his name to the new civic structures, as it was the state and the citizens themselves (the free, male residents) who commissioned and paid for all public buildings. That changed during the subsequent periods, when Hellenistic rulers and Roman emperors endowed several of the Greek cities with larger and more luxurious public buildings that bore their names: the stoa of Attalus, Hadrian's library, etc. These private donations eroded the democratic ideals of the Classical polis whereby all men enjoyed equal footing. This practice of privately funded civic structures, named after wealthy individ-

uals or corporations, similarly marks the urban landscape today.

The insularity of the Classical Greek city states, which often resulted not only in competition but also in warfare among them, was transformed in the ensuing Hellenistic period. As a result of the successful military campaigns of Philip II of Macedon, most of central and southern Greece became subjugated to the Macedonian kingdom. Philip's son, Alexander III the Great, undertook a campaign of expansion to the east, creating a kingdom that stretched from Cyrene in North Africa to India. As Alexander considered his mission to be a civilizing one, albeit imperialist, he founded several new cities, thus spreading the Hellenic language and culture across much of the known world. These cities were normally laid out in a grid pattern, adjusted to the existing topography in each case. While their building programme was based on the Classical Greek city – with an agora, temples, theatres, and other civic structures – their political system differed drastically. Whereas the classical Greek city was, at least in principle, politically autonomous, the Hellenistic city was a dependent member of an extensive empire. Alexandria in Egypt, the first and greatest of Alexander's cities, was founded in 332 BC. It soon became one of the most important trading centres of the Mediterranean, and an eminent centre for culture and philosophical studies, its Neoplatonic schools eventually rivalling the philosophy schools of Athens. "Alexandria is situated, as it were, at the crossroads of the whole world, ... bringing together all men into one place, displaying them to one another, and, as far as possible, making them of the same race", wrote Dio of Prusa in his *Alexandrian Speech* (*c.*AD 69/79). Thessalonica, founded in 316 BC, also rose to prominence under Roman rule, becoming the capital of the Roman province of Macedonia and an important military and commercial centre. It maintained its commercial and administrative importance in the subsequent Byzantine and Ottoman periods.

Greece became a Roman province in AD 146, after a war in which the Romans destroyed Corinth. Under the Roman empire Athens, though now a provincial city, still enjoyed a special status as a result of its cultural eminence. While its political significance atrophied, its physical image was enhanced by the new buildings endowed by the various emperors and high-ranking Roman officials. A resurgence of its philosophy schools in the 4th and 5th centuries infused new blood into its economy, until the emperor Justinian ordered their closure in AD 529, condemning Athens to obscurity.

The next major city to rise to prominence in the Graeco-Roman world was Byzantium, a Greek merchant settlement founded at the end of the 8th century BC on the shore of the Bosporus. Chosen by emperor Constantine the Great (307–337) as a capital of the eastern Roman empire, it was aggrandized and inaugurated in 330 as Constantinople. Constantinople was endowed with a unique triple identity: Greek, Roman, and Christian. Hailed as "the New Rome", its political, legal, and building structure certainly justified that claim. Also part of that structure, however, were the earliest layers of its Classical Greek and Hellenistic foundation, and its newly acquired Christian identity. Constantinople became the centre of the Byzantine empire, diffusing its imperial, religious, and commercial power over a vast territory. It reached its zenith under the reign of Justinian I (527–65), maintaining a key role until the period of the Latin rule (1204–61). The weakening of the Byzantine empire finally led to the fall of Constantinople in 1453 to the armies of the Ottoman sultan Mehmet II.

The legacy of Byzantine civilization did not disappear overnight with the fall of Constantinople. Just as the Byzantine emperors ensured the continuity of several Roman institutions, so too the Ottomans incorporated several aspects of Byzantine culture into their own governing system. Given the widespread destruction by the crusaders, many Greek cities, including Athens, considered Ottoman rule preferable. On the whole, the Ottomans preserved the existing urban structures, converting some of the churches into mosques, and building new mosques, *tekkes* (dervish convents), baths, and other civic buildings that imprinted on each city a new image. In fact, when Mehmet II arrived in Athens in 1458, so impressed was he with the city's ancient heritage that he conferred upon it special administrative and religious privileges. Athens, as well as other Greek cities, experienced a period of economic and population growth in the 15th–17th centuries, reflecting the overall prosperity of the Ottoman empire. Conditions deteriorated, however, in the late 18th and early 19th centuries, leading to the War of Independence (1821–27) and the establishment of the modern Greek kingdom in 1833.

The events of the 19th century caused a major rupture in the demographic and administrative structure of the Greek cities. After the departure of most Muslims, the centuries-old ethnic diversity of the population was replaced by a mostly homogeneous Greek population from the Greek countryside and the European diaspora. The traditionally decentralized administration, which enjoyed a considerable degree of autonomy and self-government, was replaced by a highly centralized monarchy modelled on the Bavarian prototype. The new capital, Athens, rose to prominence as the main administrative and economic centre, even though several other cities – Nauplia, Patras, Corinth, and Syros among them – had a much more prominent commercial profile. The charge of the new state was to forge a national Greek identity, connect the modern with the ancient past, and highlight the ancient legacy. New planning and architecture projects helped the nation's cities project a modern, uniform, and western image. The vestiges of the Classical, Roman, Byzantine, and Ottoman pasts, however, remained close to the new urban surfaces.

More recently, the European Union, of which Greece is a member, has been gradually recasting the political significance of national borders and national identities, moving towards the creation of a rich multicultural European mosaic. The annual institution of the "European City of Culture", a post already held by Athens and Thessalonica, the establishment of festivals and contests in various cities, and the widespread use of the English language have begun to create a new, shared, European identity. As individual cities and towns have begun to celebrate their own cultural histories for the benefit of a broader European public, identification with a particular city may prove, once again, more powerful than national identification.

City State

The city state (polis) was the prevailing political, cultural, religious, and social system among the Greeks from *c.*800 to *c.*300 BC. The map of ancient Greece was a mosaic of city states; each was independent, but some were linked with others by ties of kinship and military alliances.

The term "polis" originally apparently meant something like "the villages around". The Greeks used the term *synoikismos* to describe the unifying of the houses in the countryside (*oikoi*) and villages (*komai*) into a constitutional system (*politeia*). Most city states had an acropolis (a high city), a fortified area on a high rocky promontory overlooking the surrounding countryside, which served as a place of refuge in times of danger.

Geography was a factor in the rise of the city states, because the numerous islands of Greece, the very mountainous terrain of the mainland, and the isolation of small plains favoured small local units of government. Another factor was the collapse of kingship late in the Dark Ages; by the historical period most city states were ruled by councils controlled by aristocrats.

The territory of each city state was small. Some were only a few kilometres square: Athens with 2600 sq km of territory and Sparta with 8400 sq km were among the largest. Physically the city state might look urban or be composed of villages without walls, as at Sparta. The population was generally small. Slaves and foreigners (metics) were excluded from citizenship, while women, children, and sometimes "the dwellers around" (*perioikoi*) were classified as second-class citizens. The full citizens (*politai*) of the polis were all males over the age of 18. Their births would be registered with the traditional brotherhood (phratry). Regardless of its location, the male citizens were the essence of the city state. They composed a corporate body, ordered by the principle of citizenship, which could be housed anywhere. All were expected to serve in defence of the city state.

The city states were varied and numerous, eventually numbering perhaps as many as 1200 or more. Their constitutions and history largely remain unknown. The Aeolian-, Ionian-, and Dorian-speaking Greeks developed different styles of city states; Athens and Sparta are the best known of the Ionian and Dorian types, respectively. Most of ancient Greek history is known through the histories of these two, the most famous; but other important ones included Corinth, Syracuse, Miletus, Ephesus, Thebes, and Chalcis. Tribal and cultic differences marked the city states with a jealous particularism. Most were isolated in small farming valleys with their own local shrines, laws, and dialects.

By the mid-8th century BC population increases led to the foundation of numerous colonies all around the Mediterranean, but especially on the shores of the Black Sea, in southern Italy, and in Sicily. Each of these usually became an independent city state. Sometimes the new colony was founded by two or more mother cities.

The government of most city states changed over the centuries. By the Archaic period most were ruled by aristocrats in a council, but an assembly of citizens and magistrates also participated in governing. In Athens the earliest council was the Areopagus, made up of elder statesmen; the members, archons, served for life. By the end of the 7th century BC growing tensions between the aristocrats and citizens from the lower orders, in Athens and other city states, often developed into class conflicts. When Solon was elected archon of Athens in 594 BC he began a programme of political reform that was to lead eventually to the establishment of Athenian democracy at the end of the 6th century BC.

Sparta resisted all reform and maintained an oligarchy based upon the laws of Lycurgus, which had organized the people into Spartiates (citizens), *perioikoi* (non-citizens with some rights), and helots (state serfs). There were two kings, elected from two royal families, who exercised limited power; one stayed at home and the other led the army into battle. Sparta was governed by five officials called ephors, elected to one-year terms by citizens, with the aid of a council. There was also a citizen assembly (*apella*).

War, an incessant feature of life, robbed the Greeks of their strength. During the Classical period cooperative efforts were made to limit the jealous particularism through leagues. While most were military alliances, some leagues served trade needs, and even managed some of the games. They included the Aetolian League, Boeotian League, Chalcidic League, League of Corinth, Delian League, Second Athenian League, Achaean League, Ionian League, and the Delphic Amphictiony, which managed the Pythian Games.

The sovereignty of the city states ended with the conquest of the Greeks by Philip II of Macedon in 338 BC. After the conquests of Alexander the Great, Graeco-Macedonian kingdoms were established throughout the empire. The individual

Greek city states were never again strong enough to regain their original power.

Civil War 1945–1949

The Greek Civil War, rooted in the struggle for power between leftist and right-wing pro-monarchist forces, erupted after the liberation of Greece from the fascist forces of the Axis. Immediately after the withdrawal of the Nazis from Greece in October 1944, the British, who had already put Greece within their sphere of influence, intervened to establish a conservative pro-monarchist post-liberation government in Athens, in order to protect their geopolitical interests in the region. On 18 October 1944 British forces and the Greek government in exile of George Papandreou landed in Athens. Upon their arrival in Greece the British (*a*) demobilized ELAS (National Popular Liberation Army), the military wing of the EAM (National Liberation Front), who for more than three years had fiercely fought the occupation armies of the Axis, (*b*) formed a national Greek army under British tutelage, consisting largely of zealous ultra-right-wing volunteers, and (*c*) ignored public demands for the punishment of Greeks who had collaborated with the enemy during the occupation. After the clash of British troops and units of ELAS forces in Athens from 3 December 1944 to 11 January 1945, Greek army units were increasingly made up of selected ultra-conservative conscripts who were called up as army reservists.

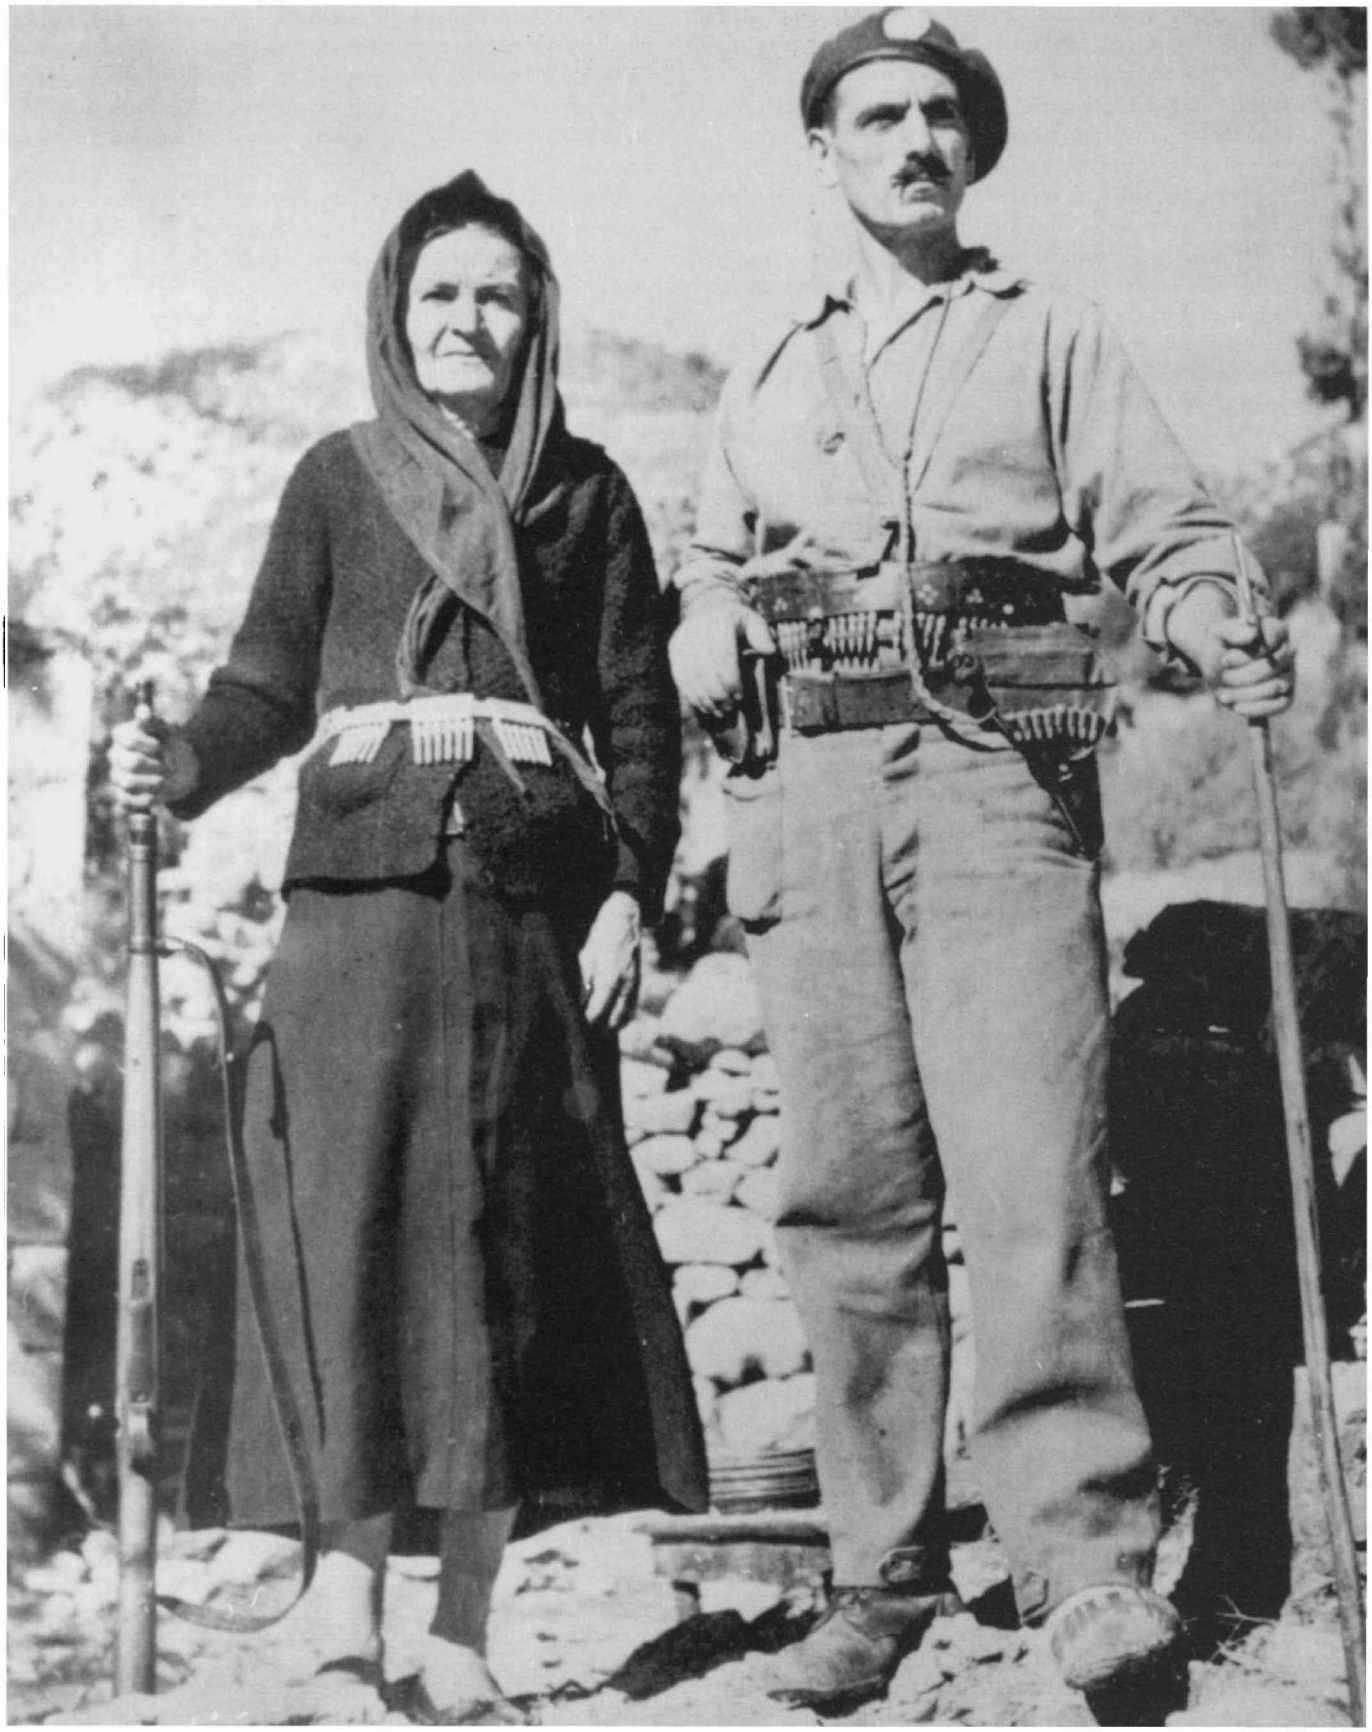
The Varkiza Agreement of 12 February 1945, between the right-wing pro-monarchists and EAM/ELAS forces, called for a general amnesty and the recruitment of ELAS into the post-liberation Greek army. After the agreement EAM/ELAS showed a willingness to coexist peacefully within a democratic parliamentary system of government and avoid violent conflicts. The peaceful intentions of EAM/ELAS, however, were ignored by the British and their right-wing Greek friends, who insisted on the return of king George II and the exclusion of ELAS and many liberals from the conscription of the Greek armed forces.

Heinz Richter has indicated that from the lower ranks to the top commands the post-liberation Greek army was filled with royalists, anti-communists, former Nazi collaborators of the Security Battalions (*Tagmata Asphalias*), and members of the ultra-right-wing "Organization X". The police, a federal law enforcement agency, also used the same political-background criteria to select their officers. Both the army and the police showed little respect for democratic procedures or civil rights and increasingly became independent from civilian control, especially when they were attacking leftist Greek citizens.

This new right-wing social order received support from the wealthy Greeks, many of whom had profited from economic collaboration with the Nazis, or from speculating in scarce commodities during the occupation (1941–44). These entrepreneurs constituted an important and powerful social group of postwar Greek society.

From October 1944 to March 1946 the British appointed and deposed four Greek prime ministers for being unable to deal with the economic problems and political instability of the country. Finally, the first elections since 1936 were held on 31 March 1946, under the supervision of British, French, and American observers. The communists, under the leadership of Nikos Zachariadis, as well as some liberals, boycotted the elections, which resulted in a clear victory for the right wing under the leadership of prime minister Constantine Tsaldaris. The new government, headed by Tsaldaris, brought forward a rigged and coerced plebiscite on 1 September 1946, and king George II returned to Athens on 27 September. The restoration of the monarchy was seen by the right-wingers, as well as many republicans, as essential to the maintenance of traditional conservative Greek institutions and values, which had been challenged by leftist forces. The National Liberation Front (EAM), for example, had advocated postwar radical institutional changes and mass participation in the political process by all regional and social groups, including the underprivileged and women.

With a new vengeful right-wing government and the return of the king, repression and persecution against the left were intensified, driving former ELAS fighters and leftist political refugees back to the mountains. Many thousands of Greek civil servants, including university professors, who had joined the resistance movement (1941–44) against the Axis, were fired from their jobs on the grounds of being "anti-nationalists". Many were terrorized by the police and right-wing paramilitary groups, imprisoned, tortured, sent into exile, or executed. During 1946, 116 Greek leftist citizens were sentenced by



Civil War: ELAS guerrillas, who had fought the Axis in World War II, returned to the mountains in 1946 as Greece descended into civil war

court marshal and executed, and another 688 in 1947. The death penalty was given for offences such as criticizing the authorities or helping leftist insurgents.

Indiscriminate persecution and terrorism by the Greek right forced more communists and liberal anti-monarchists to resort to arms for protection and survival. Attacks by left-wing bands on police posts and army patrols also became common activities. An attack on the police station of Litochoro, a village near Mount Olympus, by communist insurgents on 31 March 1946, is often cited as the start of the Civil War; on the other hand, right-wing armed bands had attacked left- wing communities in the Peloponnese; and by September 1946 several hundred left-wing armed bands were organized throughout Greece, especially in the rural areas.

In October 1946 the Communist Party of Greece (KKE) announced the formation of the Democratic Army of Greece (DAG) under the leadership of Markos Vafiadis, a former ELAS leader. Vafiadis assumed command of the new army from a headquarters in northern Thessaly. Most of the DAG combatants, including the regional commanders, were members of former resistance organizations, especially ELAS. As soon as Vafiadis assumed leadership of the leftist forces, Tito of Yugoslavia ordered that the communist Slav-Macedonian Popular Liberation Front (SNOF) should, for their operations in Greece, be under the command of the Democratic Army of Greece. Slav-Macedonians exploited the opportunity to cultivate the idea of Slav-Macedonian secessionism, an extremely unpopular policy among Greeks of all political leanings. Under enormous pressure from rank and file, the communist leadership terminated the shaky alliance between the DAG and the Slav-Macedonian units of SNOF. The separation was not amicable, and it came late. In certain instances, SNOF and DAG units fought against each other; and the right wing had already succeeded in labelling the leftists as traitors to their nation, an image which was to haunt the communists in Greece for decades.

By the end of 1946 the national Greek army had just over 98,000 demoralized and poorly trained soldiers and officers. The Democratic Army of Greece, on the other hand, had nearly 10,000 combatants and sent detachments to different parts of Greece to promote military operations against the right-wing pro-monarchist forces. The Yugoslavs and Bulgarians provided the leftist armed forces in northern Greece with guns and ammunition. Attacks by left-wing forces were more ferocious against the police and right-wing paramilitary units such as X-ites, who were considered responsible for most of the atrocities committed against leftists and even liberal Greek citizens. The police, who were not trained for combat, suffered casualties three times as heavy as those of the army. Furthermore, the police and X-ites were more likely than regular soldiers to be executed after being captured by communist insurgents. Leftist forces also took revenge on ultra-right-wing civilians who were held responsible for collaborating with police and security forces.

On 31 March 1947 the British presence in Greece was officially terminated, leaving the Americans responsible for carrying on economic and military aid to the Greek government. Fearing a communist takeover in Greece, the Americans granted massive aid as a part of a programme known as the Truman Doctrine. Within a relatively short time American aid to Greece transformed the national Greek army into a disciplined and effective fighting force under the leadership of General Alexandros Papagos. As an ardently anti-leftist force the army remained insulated by American intervention from politicians and enjoyed a close relationship with its American patrons.

On 24 December 1947 the Communist Party of Greece announced the formation of a provisional democratic government in the mountains of northern Greece under the leadership of Markos Vafiadis. The objectives of the new leftist government included recognition of the full equality of all minorities (but not the establishment of an independent Macedonian state), nationalization of banks and heavy industry, agrarian reform, democratic reorganization of the country, the creation of a democratic army, navy, and air force, and resistance to foreign aggression.

The committed hard-core communists, as well as their left-wing supporters, came from all classes of Greek society. However, the vigorous political and military leaders and organizers came from the educated and professional classes, some for democratic reasons and some for radical socialist objectives. They saw the monarchy as a reactionary, fascist institution, and the British and Americans as imperialists who looked after their own interests and supported the worst elements in Greek society in order to achieve their ends.

Communist regimes in the Balkans refused to recognize the provisional government and to deal with it in other than clandestine ways. On 27 December 1947 the Communist Party of Greece was outlawed by the nationalist government of Greece and all "communist"-related activities were subjected to harsh punishment, including the death penalty. Some leftists were spared after signing a "declaration of repentance".

Under intensive pressure by the national army, the leftist Democratic Army of Greece started to rely on forced conscription of men, as well as women, in the areas it controlled. Most of the conscripts were young, from villages and small towns, who had little or no experience of guerrilla warfare. About 25 per cent of them were females, many of whom had risen to positions of junior command. By the spring of 1948 the DAG had reached its peak of 30,000 regular combatants and 70,000 reservists in auxiliary organizations. It controlled over 65 per cent of the rural population and half of Greece's surface area. More than 700,000 Greeks became refugees within Greece. The overwhelming majority of them were forced by the national army to leave their villages in order to deprive the communist insurgents of supplies and moral support.

The forced conscription of women and men by the DAG created suspicion and distrust, even among liberals who sympathized with the persecuted members of the left. Furthermore, the *pedomazoma* (abduction) of 28,000 children from the war zone of northern Greece to Eastern European countries by the Greek communist forces became the most contentious and emotive issue of the Civil War against the insurgents. According to the communists, the children, many of whose parents were in the DAG, were evacuated for their own protection; according to the Greek government, to be indoctrinated as young communists.

With the increase of military and economic aid from the United States, the national army of 147,000 men became an effective force in military operations against the Democratic

Army. Many tens of thousands of auxiliary military organizations (e.g. National Guard, police, and armed civilians) played an important supportive role for the national army. The final battles of the Civil War were fought in the summer of 1949 on the Grammos and Vitsi mountain ranges in northern Greece, where 16,000 combatants of the Democratic Army held heavily fortified positions. Other battles were fought in the mountainous regions of the Peloponnese. Overwhelmed by the superior nationalist armed forces, and battered by massive air strikes, the Democratic Army was finally defeated. Over 3000 leftist troops escaped to neighbouring Albania, Bulgaria, and Yugoslavia. Although minor clashes between the national army and small leftist units continued for several months throughout Greece, the Greek Civil War was over.

In his analysis of the war, the historian Richard Clogg indicates that there were at least four factors which contributed to the military defeat of the communist forces in Greece. First, the forced conscription of men and women by the Democratic Army and the abduction of children from the war zone to Eastern bloc countries. Because of these two unpopular policies the communists lost the support of the Greek liberal population, who might otherwise have been attracted to some of their political and economic objectives. Second, the inclusion of Slav-Macedonians in the Democratic Army, a very unpopular policy even among Greek leftists. The majority of the leftists would not fight for a cause which, if successful, would truncate their country. Third, the feud between Stalin and Tito. When Yugoslavia was expelled from the Cominform in 1948, the Greek communists sided with Moscow. As a consequence Tito closed Yugoslavia's borders with Greece in 1949, depriving the Democratic Army of much-needed supplies as well as important reserves. More than 4000 combatants of the Democratic Army were cut off in Yugoslavia and not permitted to cross back into Greece to assist their comrades. The fourth factor was the massive influx of American economic and military aid to the national army to contain Soviet expansionism. Furthermore, since Greece was within the British and American sphere of influence, the Soviets were unwilling to risk a confrontation with the West in order to secure a leftist victory in Greece.

During the Civil War over 158,000 Greeks lost their lives. Estimated casualties, according to the Greek government, included 29,000 leftist combatants and 11,000 of the national army. More than 40,000 leftists were sent to concentration camps by the pro-monarchist government. About 20,000 men and women were tried for crimes against the state and, of those, at least 5000 were executed.

After the defeat of the Democratic Army in northern Greece in August 1949, more than 70,000 men and women fled to Eastern Europe and the Soviet Union as political refugees. The systematic persecution and ostracism of the communists continued until July 1974 when the Greek parliament voted for the legalization of the Greek Communist Party.

The destruction of the Greek economy by the Axis occupation and the Civil War, along with high rates of unemployment during the 1950s and 1960s, forced hundreds of thousands of Greeks to leave their country in search of better social and economic opportunities in other countries, including Australia, Canada, and the United States. Most of them were economically deprived peasants with little academic attainment and occupational skills. Some peasants, however, emigrated to large cities, especially in the Athens area, to find jobs and improve their socio-economic status.

Political persecution against the left-wing elements by the right wing during the post-Civil War years also forced a large number of Greeks to emigrate to Australia and Canada, where they could find political freedom and better economic opportunities. At that time the US Embassy in Athens was very reluctant to issue visas of immigration to Greek citizens with leftist ideologies, especially those affiliated to the Communist Party.

Between 1951 and 1971 over 10 per cent of the Greek population had emigrated to foreign countries, mainly for economic and political reasons. These patterns of emigration, along with the introduction of new agricultural technology, contributed to a steady decline of the rural population in Greece. The proportion of the rural population was changed from 53 per cent in 1951 to 35 per cent in 1971.

Classical Period *c.*479–323 BC

The Classical period of Greek civilization is framed by wars: at the beginning was the great conflict with the Persian empire culminating in the defeat of Xerxes' invasion of 479 BC; at the end was the war between Philip II, king of Macedon, and the alliance of Athens and Thebes, followed by the conquest of the Near East by Philip's son Alexander the Great. Undoubtedly these circumstances influenced the character of the period, though they are only one factor in its complex form. The period also witnessed the greatest achievements of the Greek city state and its varied political systems: in essentials, this was marked by the triumph of the voluntary cooperation of the free citizens who constituted these small communities over the monolithic and massive resources of an absolutist, autocratic empire. At the same time, however, the city state contained the seeds of its own decline. The need to build a larger political organization strong enough to continue the combat against the Persians led to empire and hegemony within the Greek states themselves (particularly that of Athens, which dominated the

Classical Period: sculpture from the west pediment of the Parthenon showing Iris, messenger of the gods, *c.*438 BC, British Museum, London

first half of the period), and the subsequent rivalry and quarrels that weakened that unity following the great war between Athens and Sparta, and their resulting collective weakness in the face of the aggressive monarchy of Philip II.

Classical art and literature grew out of the developments of the preceding Archaic period, though political success engendered a new confidence. It is noticeable in the fine arts, in both sculpture and (in so far as the evidence for it has survived) painting. Already in the late Archaic period sculpture had been evolving away from its oriental- (and particularly Egyptian-) derived formalism towards greater naturalism. The stiff, formal poses of the Archaic marble statues give way to more complex ones made possible by the rapid development of hollow cast bronze. Indeed, the extremely elaborate poses of some early Classical statues, such as the *Discus Thrower* of Myron, seem specifically to illustrate their freedom from the restraints previously imposed by the marble block. This phase passed, and Classical sculpture is marked essentially by a relaxed, yet idealized, naturalism. But what were by repute its greatest achievements, the lost statues of gold and ivory (fixed on a wooden frame) made by Phidias as the focus of worship in the temples of Athena on the Acropolis of Athens and of Zeus at Olympia, must have had an awesome majesty and formality that transcended any natural representation.

Much of this sculpture was produced to satisfy the demands of official patronage rather than the private individual. Statues were set up as thank-offerings for victory, or to express the religious needs of the community, rather than as monuments to the prestige and power of ruling families. The city, the community, commissioned them, and the art reflected, very often, the political agenda set by the community itself. Not all of this was the triumphant militarism typified by Phidias' colossal bronze of *Athena the Champion* that dominated the Acropolis of Athens, and which was prominent enough to serve as a landmark to guide ships approaching the harbour of Piraeus, more than 6 km away. More subtle, and echoing the changed circumstances of the 4th century BC, was the personification of *Peace* and her infant *Wealth* made by Cephisidotus (of which later copies survive), while a surviving original bronze of *Athena*, plausibly attributed to the same sculptor, though armoured, seems to present no threat of military aggression. The emphasis, more and more, is on humanity, as in the *Hermes Playing with the Infant Dionysus* by Praxiteles, Cephisidotus' more famous son, which was found at Olympia and often thought to be an original, not a copy. But in many ways the logical and most influential development of Classical sculpture is seen in Praxiteles' *Aphrodite*, sensational in its own day on account of its nudity, and a forerunner of an endless sculptural interest in the naked female form (and, in this case, supposedly modelled not on an imaginary goddess but on the sculptor's own mistress).

Despite this, sculpture was very much a public art, and even the *Aphrodite* was purchased by the people of Cnidus in Asia Minor, to be set up there in a sanctuary of the goddess, where the statue became a tourist attraction. Statues were placed in religious sanctuaries and in public places such as the agora, a term better translated as the civic centre rather then the marketplace of the Greek cities. Sculpture also adorned public buildings, particularly temples, which, continuing the conventions of the Archaic period, carried relief decoration on their friezes, and sculpture in the round in their pediments, the supreme examples of the Classical period being the temple of Athena, the Parthenon, on the Acropolis of Athens, and the slightly earlier temple of Zeus at Olympia. Certainly at Athens, and in all probability at Olympia, this work did not simply pay tribute to the gods, but at the same time celebrated victory over the barbarian, the Persian invader. It is typical of the Classical attitude, however, that it did this by allegory (for example, Greeks defeating legendary Amazons) rather than by direct representation, an indication that the Greek approach was now radically different from that of the Near Eastern predecessors.

Painting, we know, was used to decorate public buildings, such as temples, porticos, and feasting rooms, such as at the entrance (Propylaea) to the Athenian Acropolis. Executed on wooden panels or plastered walls, it was essentially a fragile

medium and is now largely lost. Decorated vases, their pictures fired in the kiln, give us some idea of developments – the move towards greater realism, perhaps in advance of sculpture, and the illusion of three dimensions and depth. The panel-painting technique of colour wash on a chalky white ground was used briefly in the last part of the 5th century BC in a special category of vase, made to be deposited in graves; the best illustrate the freedom that artists had then mastered. In 1977, the unearthing of the tombs of Philip II and other members of the Macedonian royal family revealed wall-paintings of dazzling mastery that anticipate uncannily the achievements of Renaissance artists, in the sense of liberation from long traditions and conventions: such work clearly went on to inspire artists in the Hellenistic and Roman periods.

Architecture was firmly rooted in the forms of the Archaic period – superficially, there is no great difference between the Doric temple of Artemis at Corcyra, of the early 6th century BC, and the Parthenon, the greatest Doric building of the 5th century BC. Developments can be seen in the improvement in technique, particularly the use of marble, and the refinement of detail. Yet there is more than this. Though it is not easily noticed by the naked eye, the Parthenon represents the application to building design of a rigorously thought-out sequence of mathematical proportions, particularly in the ratio of 4:9, that is 2 squared to 3 squared. It is in mathematics that some of the greatest advances of the Classical period can be discerned. Despite having – or perhaps, by virtue of having – hopelessly cumbersome numerical systems, the 5th century BC was the time at which the Greek interest in mathematics became fully awakened, not surprisingly through geometry, ratio, and proportion rather than arithmetic. Sculptors such as Polyclitus saw the ideal of human beauty in the mathematical relationship between the different parts of the human body. The mathematicians of the Classical period constituted a discipline that has continued uninterruptedly, through the succeeding Hellenistic and Roman periods, inspiring the Arabic mathematicians of the Middle Ages, and on to the present day. Thus the work of the 4th-century mathematician Eudoxus of Cnidus was incorporated by the Hellenistic Euclid into his fundamental textbook, the *Elements*, which was still an essential schoolbook in the 20th century.

In addition to mathematics, and also building on the pioneering achievements of the Archaic period, the natural sciences flourished. Much, inevitably, was theoretical, but in what we would term physics for instance, Greek scientists evolved the atomic theory. It was still essentially the age of the universalist, but so much had been achieved that the greatest of them, Aristotle, gathered together in his writings (which read more like lecture notes, carefully preserved for posterity, than published works) his systematical concepts of the whole range of scientific thought – and beyond. The philosophers – a term coined in the Classical period – also turned to the study of human behaviour, politics and the nature of political relationships, the concepts of law and order and justice, of religious and related matters, of poetry and the arts. The nature of the ideal state was investigated; in size and scope, not surprisingly, it resembled the Classical Greek city state, but the unsatisfactory nature of contemporary political forms meant that no existing city furnished an ideal model, although Aristotle studied the constitutions, presumably all different, of some 150 of them.

How much of practical value this study of political theory achieved is dubious, though Plato went to Syracuse to advise the autocratic ruler of that city, and Aristotle was chosen by Philip II to be tutor to his son Alexander the Great. The principal achievement of the philosophers based in Athens, including Aristotle, who was not a native Athenian, was the institution of their own philosophical schools (again, with Archaic-period antecedents). These were based on the exercise grounds, the gymnasia, of the Classical city, and they survived and even developed as centres of intellectual life through the succeeding Hellenistic and Roman periods. Although as centres of paganism they were suppressed by the Christian emperor Justinian, they provided a model for Alexandria, for the Arabic centres of the Middle Ages, and so again through post-medieval Renaissance Europe to the present day.

During the Classical period there was a great flourishing of literature. Earlier literature, since the time and works of Homer, comprised exclusively poetry. Now a significant prose literature began. The writings of Herodotus in many ways typify the Classical achievement. First and foremost, he brought to Greece a great personal knowledge of the wider world within which the Greeks existed and operated. Born at Halicarnassus in Asia Minor, he was by birth a subject of the Persian king; his neighbours were the non-Greek Carians. He certainly visited Egypt and other parts of the Persian empire before arriving in Athens, at the period of its great rise to power and prosperity following the defeat of Xerxes' invasion. He knew the leading political families, who told him their family histories, which were so important a part of the city's development. He was inspired to record the history of the Persian Wars, as the first united achievement of the Greek peoples since the siege of Troy (which to him, of course, was equally historical). In a world where education included above all else a knowledge of the Homeric poems, he set out to produce his own epic of the Persian Wars – but written in prose, not verse. He included everything that seemed to him to have even the least bearing on the history of the war, and thus preserved for us a vast spectrum of contemporary knowledge. Above all, in doing this, he instigated the study of contemporary or near-contemporary events: as the "father of history" he certainly inspired his more methodical successor Thucydides, who wrote about the lesser war between Athens and Sparta, with a deeper insight into historical analysis that this tragic event required, and thereafter an endless sequence of historians, down to the present day. From this, too, prose became the natural medium of expression for the philosophers.

At the same time, drama was developed as a new form of poetic literature. Here, too, the roots lie in the Archaic period, in the choral odes sung and danced at religious festivals throughout the Greek world. Tragedy required the participation of individual actors, separated from the choruses. They played the roles of recognizable characters drawn from the almost limitless repertoire of traditional legend and myth. Significantly, actions based on contemporary events are almost unheard of; the main known – and surviving – example is Aeschylus' play the *Persians*, which again was based on the events of Xerxes' invasion. Comedy was more involved with contemporary affairs, particularly politics, and often portrayed

real politicians or other public figures. It was all part of the ferment of contemporary intellectual life. The surviving examples of both tragedy and comedy come, almost inevitably, from 5th-century Athens. Drama went into a marked decline in the succeeding century, the only real survivor being the "new" non-political comedy of manners of the late 4th century BC. Until recent discoveries of these plays on papyri from Egypt, they survived only in Latin versions of the 3rd and 2nd centuries BC. From the Greek examples, later Latin plays, written as literary exercises rather than for production on the stage, in their turn inspired subjects for plays by Shakespeare.

It would be wrong to create the impression that Classical Greece was unified in its achievement. Some places – most obviously, Athens – predominate because their own position in the Classical world, their wealth, and their power were particularly inspiring. In these places the culture of the Classical period is very much a *Zeitgeist*, the spirit of the age. They might well stimulate achievement elsewhere. All the same, much of the Greek world was outside this achievement. Some cities, such as Sparta, quite deliberately turned their backs on it in a desperate attempt to preserve what were for them the more congenial virtues of the preceding Archaic period. Many places, poor and small and insignificant, remained outside through lack of opportunity or sheer ignorance. All the same, awareness of what was being achieved was widespread, and the excitement, if not the opportunity, was not restricted by political or geographical divisions. Aristotle, surely the greatest intellect of the Classical period, came from Stagira in northern Greece, a place that recent excavation has shown to be nothing more than a rather squalid village; to gain intellectual fulfilment he had to move away, not just to the wealth of Philip II's growing kingdom but to Athens, in political decline but still the epitome of Classical civilization.

Summary

Roughly 479–323 BC – from the end of the Persian Wars to the death of Alexander the Great. The period is notable for a cultural flowering in Greece – and especially in Athens – in almost every field which brought to maturity the seeds sown in the preceding Archaic period. Among other highlights, the tragedies of Aeschylus, Sophocles, and Euripedes, the philosophy of Socrates, Plato and Aristotle, and the sculptures of Phidias and Praxiteles are considered benchmarks in the development of Western civilization.

Cleisthenes *fl.*525–505 BC

Athenian political leader

The clan of the Alcmaeonidae, to which Cleisthenes belonged, had been prominent in the old "Eupatrid" pre-Solonian aristocracy of Athens. One of its members, Megacles, was chief archon around *c.*630 BC when another noble, Cylon, attempted to seize power and set himself up as "tyrant". Megacles rallied the people and blockaded him on the Acropolis. Cylon escaped, but his followers, who had taken refuge at the statue of Athena, were killed, despite a promise of safe conduct. As a result the whole clan was tried, put under a curse, and exiled.

Restored, it seems, at the time of Solon's reforms (594 BC), the Alcmaeonidae emerged in the mid-6th century as leaders of the coast faction, the "Men of the Shore" in Herodotus' account (1. 59) of the political struggles that led to Pisistratus' three attempts to establish a "tyranny"; Aristotle (*Athenian Constitution*, 13) identifies this faction as the supporters of "the middle form of constitution", such as Solon had tried to bring about, and views Pisistratus as "a man who seemed inclined to democracy". The Alcmaeonidae went into exile (Herodotus, 1. 64) after Pisistratus' successful third attempt with strong foreign backing.

Cleisthenes, who at this time was at least an adolescent, if not an adult, presumably went with them. But at some point, probably after Pisistratus' death in 528/27 BC, he returned to Athens, now ruled by Pisistratus' son Hippias, for he was almost certainly the Cleisthenes who appears in one fragment, discovered in the Athenian Agora, of a late 5th-century BC list of chief archons, as holding office in what its editors identify as 525/24 BC.

Later Cleisthenes was again in exile with many of his clan, who, after failing to spark a popular rising against Hippias by means of an armed incursion into Attica, withdrew to Delphi, where they obtained the contract for rebuilding the fire-damaged temple of Apollo. Their lavish performance of the task won them influence with the Delphic authorities, who were persuaded to advise the Spartans, whenever they came to consult the oracle, to liberate Athens from the tyrant. This advice was probably instrumental in winning support at Sparta for such men as king Cleomenes, who had other reasons for removing Hippias. In the event, after a failed seaborne invasion in 511 BC, the following year Cleomenes took a substantial army by land from the Peloponnese, won a battle, and forced Hippias into exile.

Cleisthenes' role in these events is unknown, but he is identified by Herodotus (5. 66) as one of the two most powerful men in Athens after Hippias' expulsion, his rival being Isagoras, described by Aristotle (*Athenian Constitution*, 20) as a friend of the tyrants. Isagoras gained the upper hand, being elected chief archon for 508/07 BC, whereupon, as Herodotus puts it, Cleisthenes "took the people into his party", words echoed by Aristotle, who adds: "by proposing to give political power to the masses". The clear inference to be drawn from their wording is that they believed that this action was born of political expediency, a belief that the previous history of the Alcmaeonidae, for all their support of the Solonian reforms, cannot be said to refute.

Cleisthenes' appeal to the people must have met with a response, for Isagoras at once sought help from Cleomenes, who had worked with him in 510 BC. The Spartan king's reply was to call on the Athenians to expel Cleisthenes and others of "the accursed" (Herodotus, 5. 70) – the descendants of the Alcmaeonidae who had been punished with a curse after the massacre of Cylon's supporters in the late 7th century BC – and then to travel to Athens with a small force. Before he arrived, Cleisthenes himself left Athens, a move that, whatever his motive, enabled the people to decide on their best policy without the pressure of the curse, but Cleomenes still set about expelling as many as 700 households of Cleisthenes' supporters. He also tried to replace the Solonian Council of 400 with a body of 300 partisans of Isagoras, and then seized the Acropolis. The people rose against him and after a two-day siege forced him to depart under truce, expelled Isagoras, and recalled Cleisthenes.

Cleisthenes now carried out his promise to give power to the people. His principal reform was to create a new tribal structure for the political and military organization of the Athenian people, replacing the four old Ionian tribes based on kinship with ten new tribes based on 139 small local units, the demes, grouped in such a way as to minimize the influence of the wealthy landed nobles by making each tribe consist of people drawn from all over Athens and Attica. He linked demes together, not necessarily with their immediate neighbours, to form thirty *trittyes*, ten in each of three regions, the city, the inland, and the coasts, and then took one *trittys* from each region to form each new tribe. He thus aimed to preserve the unity of the state against the sort of powerful regional factions whose rivalries had led to Pisistratus' tyranny and whose re-emergence Isagoras' success seemed to foreshadow.

Cleisthenes then used the new tribes to reshape Solon's Council of 400. Enlarged to 500, it was to consist of 50 men from each tribe selected by lot from nominees of the demes, the members to change annually and no one to serve more than twice in his lifetime. These arrangements ensured that it could not be controlled by minority pressure groups, while educating a good proportion of the citizens in public affairs, and so it enabled the sovereign Assembly open to all citizens, whose business it prepared and whose decisions it carried out, also to be truly democratic and effective. The two essential institutions of Athenian democracy were now in place and functioning properly. Cleisthenes' enactment of the only other measure credited to him, the introduction of ostracism (Aristotle, *The Athenian Constitution*, 22), has been needlessly doubted on the grounds that the procedure was not used until 488/87 BC.

His name is not linked with any event after his reforms of 508/07 BC and it is not known what part, if any, he had in the successful defence of the new democratic Athens against threats from Sparta, Thebes, and Chalcis (506–505 BC), or even when he died. However, both Herodotus (6. 131) and Aristotle (*Athenian Constitution*, 29) refer to him without qualification as the one who "established democracy"; Isocrates in his *Areopagiticus* (*c.*354 BC) sees the system he set up as greatly preferable to the radical democracy of his own day. Under it, certainly, the Athenians were very successful. In the modern democratic era, although due weight has been given to the influence of Solon as the "father of democracy", and although some scholars have detected signs of pro-Alcmaeonid gerrymandering in allocating *trittyes* to tribes, the essential role of Cleisthenes in the democracy's development to maturity has been freely recognized, not least in the celebrations that marked the 2,500th anniversary of his laws.

Biography

A member of the Alcmaeonid clan, Cleisthenes (date of birth unknown) was probably chief archon in 525/24 BC during the tyranny of Hippias. After the expulsion of Hippias by Cleomenes of Sparta in 510 BC, Cleisthenes emerged as a popular leader and in 508/07 BC carried out political reforms that set in motion the machinery that would bring about the establishment of Athenian democracy. Date of death unknown.

Clement of Alexandria, St

*c.*AD 150– *c.*AD 215

Christian writer

It is to a large degree thanks to Clement that the cultural and philosophical traditions of Hellenism were deemed to be a legitimate component of Christian theology. In the religious and philosophical melting pot that was late-antique Alexandria, Clement fought a two-sided battle that was in many respects successful. Against the tendency to reject the Hellenic tradition outright evinced in Tatian, Tertullian, and Irenaeus, Clement defended the utility of Hellenic learning for the defence and deepening of the faith. On the other front, Clement attacked the complex and seductive speculations of the Gnostics, which had proved so attractive to many educated Christians.

The bulk of Clement's work forms a kind of trilogy. The *Protrepticus* or *Exhortation to the Greeks* is an attack on the absurdities of pagan religion and a call to accept the only true religion, that which has been sublimely revealed by Christ, the *Logos* of God. The *Paedagogue* or *Teacher* takes up the instruction of those who have accepted baptism. Its aim is to teach the perfect accomplishment of the virtues. The *Stromateis* or *Miscellanies* are, as the title suggests, a collection of diffuse materials; they deal, among other things, with the relation between the Christian faith and Hellenic philosophy, with marriage, and with the ideal of the true gnostic. In addition Clement composed a small work, *Quis Dives Salvitur?*or *Who is The Rich Man that is Saved?* This piece is a commentary on Mark 10: 17–31. Clement argues that the Christian is not required actually to sell all his goods, but rather to be free from attachment to them. Other works survive only as fragments.

Clement's teaching is centred on the *Logos*, the creator, instructor, and perfecter of humankind. The *Logos* has revealed God to the Jews in the Law of the Old Testament, to the Greeks in their philosophy, and finally and most perfectly in his own Incarnation. Philosophy is therefore a legitimate tool of Christian theology. The difference is one of degree, not of kind.

In opposition to the Gnostic tendency to divide Christians into more or less predetermined classes, Clement insists upon the sufficiency of faith and the equal grace conferred upon all at baptism. Also against the Gnostics, Clement affirms the integrity of the material order and the goodness of the body. Against the tendency found among Christians and Gnostics alike to denigrate marriage, Clement upheld its sanctity. He goes so far as to suggest that the married Christian is on a level above the celibate. The celibate has fewer distractions and encumbrances; his task is therefore easier.

Notwithstanding the equality of grace received at baptism, the Christian must strive for perfection. Through the exercise of his free will, he must struggle for the gift of *apatheia*, or freedom from passions. God is radically unknowable, but is made known to those who love him. Clement's apophaticism is more than mere agnosticism. The true gnostic is led by the *Logos* to the contemplation of God. By way of this anagogy, man is deified. Clement speaks of man's deification with almost unprecedented clarity.

Of Clement's immediate background we know frustratingly little. He is very vague about his own teachers, naming only one of them, the Alexandrian lecturer Pantaeus. His work is suffused with Platonic philosophy and Stoic ethics, and marked by Aristotelian logic and vocabulary. His frequent allusions to Classical literature, no doubt intended to keep up the interest of his cultured audience, are drawn from both florilegia and direct acquaintance. He is patently indebted to the Jewish Platonist Philo of Alexandria, particularly in respect of the allegorical method of biblical exegesis, the incomprehensibility of God, and the ideal of *apatheia*. Clement's integration of the Hellenic tradition and Christianity is a more searching and critical development of that proposed by St Justin Martyr. Clement's *Exhortation* owes some elements to Tatian's *Exhortation*.

The influence of Clement has been profound. The fusion of Hellenic philosophy and moral teaching with Christianity proved to be a heady mixture. Origen, though a man of greatly different temper, continued the work of Clement, establishing Christian Platonisim as the hallmark of the school of Alexandria. The Cappadocian Fathers represent the greatest flowering of the tradition of Clement and Origen. Clement's influence is clearly perceptible in the works of Evagrius of Pontus and pseudo-Macarius, the two great fountainheads of monastic spirituality. Clement's conception of the angelic hierarchies may be regarded as an ancestor of that made famous by Dionysius the Areopagite. Clement is quoted with deep approval by St Maximos the Confessor. He continued to be an important authority for the Byzantines. While removed from the Roman martyrology in the late 16th century, he remains accounted a saint by the Orthodox Church.

MARCUS PLESTED

Biography

Born *c.*AD 150, probably at Athens, educated at Alexandria in the catechetical school of Pantaenus, whom he succeeded. Principal surviving works are: *Protrepticus* (*Exhortation to the Greeks*), *Paedagogue* (*Teacher*), and *Stromateis* (*Miscellanies*). He argued for the legitimate retention of Hellenic cultural and philosophical traditions in Christian theology. He left Alexandria in 202 before the persecutions of Septimius Severus and died between 211 and 216.

Cleomenes III 260–219 BC

King of Sparta

The lives of Cleomenes III (Agiad, reigned *c.*235–222 BC) and his predecessor Agis IV (Eurypontid, reigned *c.*235–222 BC) are the subject of numerous studies and novels, ancient as well as modern. After Lycurgus the lawgiver, Leonidas, and Agesilaus II, they are the most famous exemplars of Spartan culture.

Their achievements and significance, on the other hand, are the stuff of history.

Cleomenes probably acceded to the Spartan throne in 235 BC. He could not have chosen a more pregnant moment. For it was then that Aratus achieved the decisive gain for the Achaean League that imperilled Sparta's future, in a way that Macedonian suzerainty of Greece had not. Megalopolis, led by its ex-tyrant Lydiadas, threw in its lot with Achaea, whose foreign policy thereby took on a decidedly anti-Spartan flavour. Like all his royal predecessors since Agesilaus II, only more so, Cleomenes had to keep watch on Megalopolis, no matter how preoccupied he might be otherwise with internal upheaval or other external threats from inside or outside the Peloponnese. Unlike all his predecessors, Cleomenes not only recovered from Megalopolis the disputed borderland of Belminatis but actually destroyed the urban centre of the Great City itself. For this, among many other things, he earned the enduring hatred of Polybius, even though the historian was born in a resurgent Megalopolis, 20 years after the king's ignominious death in exile.

The only hope for Sparta to regain its important standing in the Peloponnese was to mobilize all its inner strength and deal with the urgent social problems that beset it. Cleomenes seems to have understood this at a very early stage, and, instead of following the example of his father Leonidas and his father's cousin Areus, he decided to emulate Agis. It came as a surprise to his contemporaries to see the principles of Agis adopted by the son of his most bitter enemy.

Cleomenes was neither a romantic dreamer nor a dogmatic rationalist, but a practical politician. He was determined to solve the urgent social problems of Sparta in order to increase its political and military power, and at the same time to strengthen his own position. He knew very well that he could not carry out the necessary reforms by persuasion alone, and therefore tried to gain popularity and fame through military feats.

This does not mean, of course, that these events cannot or should not be viewed within their wider context, particularly the continuing balance of power between the three great dynasts of Macedon, Egypt, and the Near East. Indeed, it was this stalemate and, particularly, the enfeebled Macedonian suzerainty over Greece as represented successively by Antigonus II Gonatas (*c.*277–239 BC) and Demetrius II (*c.*239–229 BC) that allowed the Aetolian League, the Achaean League, and then Sparta under Cleomenes the space for internal consolidation or transformation and external expansion. In fact, it was the resurgence of Macedon under Antigonus III Doson in the 220s BC, ironically precipitated by Cleomenes, that fully exposed the limitations of the single Greek city state as a power unit and put paid to Sparta's illusory independence and ephemeral social renewal.

Cleomenes had planned his coup well in advance with the collaboration of a small group of sympathizers, including his stepfather Megistonous, a rich landowner. Returning to Sparta one evening (probably in the autumn of 227 BC) he fell upon the ephors at supper, killing four of them and ten of their chief supporters, and seized power. Eighty opponents were proscribed. Cleomenes then proceeded to carry out the same revolutionary programme that had led to the downfall of Agis. All landed property was put into a common pool, debts were cancelled, and the land was divided into 4,000 Spartan lots. He raised the citizen body to perhaps 5,000 from the metics and *perioikoi* (dwellers round about), but in the reassignment of the land, lots were reserved for proscribed exiles, whose eventual reconciliation and return was evidently envisaged – or at least that was the impression that Cleomenes sought to convey. Equally important for his aims, the traditional Spartan *agoge* (upbringing), with military training, age groups for boys, and common messes for adults, was reintroduced. But Cleomenes' measures were not simply backward-looking. Now at last, a century after Alexander and after several Spartan defeats, he introduced the Macedonian type of phalanx and spent the winter drilling his troops in the use of the long pike, the *sarissa*. Constitutionally, he weakened the Gerousia by attenuating or removing some of its powers, and by making election to it annual rather than for life (a major source of its enormous prestige), and abolished the ephorate, which he condemned as an excrescence on the "Lycurgan constitution", a move that led his opponents to brand him as a tyrant. According to Pausanias, he established a new board of magistrates, the *patronomoi* (the title means "Guardians of Ancestral Law and Order").

The Cleomenean revolution struck a chord in the cities of Sparta's Achaean opponents, where the poor sub-hoplite citizenry yearned for debt cancellation and land redistribution on the Spartan model, which they obviously regarded as exportable. This, however, was a grave misapprehension, because Sparta's unique sociopolitical conditions could not simply be reproduced elsewhere, and because Cleomenes had no intention of exporting social or economic revolution of any kind. Ideological preference may have had something to do with this refusal, but a more powerful factor was the pragmatic consideration that Spartan hegemony over an association of cities dominated by mass movements of a genuinely democratic character was likely to be radically unstable and bound to attract the unwelcome attention of Macedon, which had made its views on popular social movements unequivocally clear from the very outset of its hegemony of Greece.

The Cleomenic War, the war against Cleomenes as seen from the Achaean standpoint, lasted from 229/28 to 222 BC. At the beginning Cleomenes was very successful, and almost provoked the collapse of the Achean League. By the beginning of 224 BC his military-political drive had not only brought Argos and most of Arcadia within the Spartan camp but had carried his victorious arms into and beyond the original Achaean heartland to the very gates of the Peloponnese at Corinth. The victory in the field at Hecatombeum in western Achaea in 226 BC was matched in 225 BC by the diplomatic triumph of the adhesion of Argos. Even Aratus' own Sicyon trembled before the blast and had its loyalties severely strained. A few months into 224 BC, however, the wily and perplexing Aratus, former liberator of the Acrocorinth and unifier of much of the Peloponnese on an ostensibly anti-Macedonian alliance, deployed his recently acquired authority as general plenipotentiary (*strategos autokrator*) to lead the Achaean League into an alliance with none other than the old enemy Macedon.

A century before, the decisive battle between a still independent Greece and Macedon at Chaeronea had preceded the formation in 338 BC of Philip's Hellenic League, usually known

as the League of Corinth. In the 220s BC the decisive encounter between Macedon and a still independent Sparta succeeded the formation of a new Hellenic League conceived on significantly different lines. Not only was Doson's league directed specifically against Sparta and the generalized social revolution it was supposed to stand for, but this was an alliance of federations, not single poleis.

The battle that was to settle the war was fought near Sellasia on the northern borders of Laconia. But Cleomenes' cause was already lost, and Ptolemy IV Philopator acknowledged that he had become a poor investment by cutting off his subsidy just days in advance of the fighting. But so far as can be ascertained, the decisive factor in Macedon's victory was superiority in numbers. Cleomenes' losses were heavy; but he himself escaped with a handful of men to Sparta, and thence to Gytheum, where they embarked for Egypt, to join his mother as a refugee in Ptolemy's Alexandria. Antigonus proceeded to take Sparta and achieved what Philip II had scorned to attempt and Pyrrhus among others had failed to execute, the first capture of the city.

Cleomenes' political reforms were now cancelled and the ephorate was restored; the kingship was in effect left vacant. The fate of his social and economic measures is less certain. The cancellation of debts clearly could not be reversed. It seems on the whole likely that in this field Cleomenes' measures were not wholly abrogated but that some sort of compromise was reached.

A vaguely Cleomenean political tendency at Sparta survived the battle of Sellasia. But it was a lost affair, especially after the pathetic deaths of Cleomenes and his handful of supporters at Alexandria in spring 219 BC in a futile rising against the new Ptolemy IV Philopator. The legend of Cleomenes, however, was in safe hands, and his ideas influenced generations to come.

DIMITRIS A. KALOGERAS

Biography

Born 260 BC. Spartan king (235–222 BC) and political reformer. Cleomenes tried to solve the social problems of Sparta in order to increase its political and military power and at the same time strengthen his own position. He reinstalled the Lycurgan political system, cancelled debts, and redistributed land in equal portions. His reforms alarmed neighbouring states, especially Macedon. He was defeated in 222 BC at Sellasia and his reforms cancelled. He went into exile and died in Alexandria in 219 BC.

Cleopatra 69–30 BC

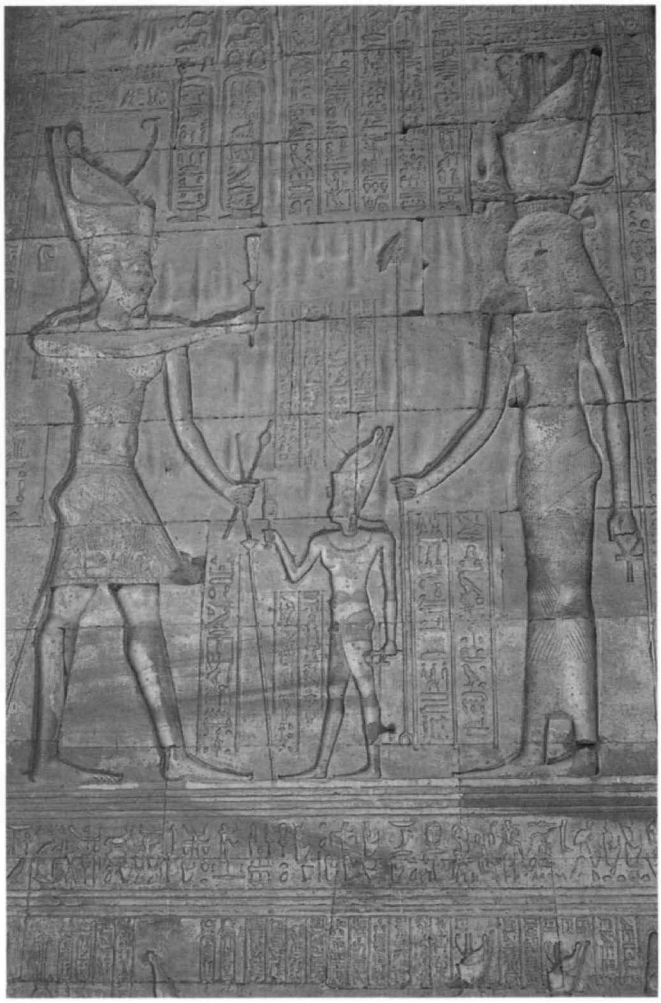
Queen of Egypt

Cleopatra was born in 69 BC to Ptolemy XII Auletes, king of Ptolemaic Egypt, and (almost certainly) his sister-wife Cleopatra V. The third of their six children, Cleopatra grew up against the backdrop of her father's turbulent reign, in the course of which he was deposed and fled Egypt for some years. During this period Cleopatra's two elder sisters ruled as pharaohs, although one soon died and the other was killed after Ptolemy XII was restored with Roman support. Nothing is known about Cleopatra's early life, but when her father died in 51 BC, Cleopatra was his eldest surviving child and acceded to the throne as Cleopatra VII Philopator, ruling jointly with her younger brother Ptolemy XIII, whom she married in accordance with Ptolemaic custom.

On account of the machinations of ambitious ministers and the agitation of the Alexandrian populace, the Egyptian throne was still far from secure. A war was engineered between brother and sister, leading to Cleopatra's expulsion from Alexandria. During the course of the contemporaneous Roman civil war between the triumvirs Pompey and Julius Caesar, Pompey fled to Egypt after his defeat at the battle of Pharsalus, and was pursued by Caesar. Pompey was treacherously murdered by the supporters of Ptolemy XIII. When Caesar arrived with his troops he decided to support the claims of Cleopatra and fought on her behalf the Alexandrian War against her brother. Caesar was by now married to his third Roman wife and was in his early 50s; Cleopatra was a young woman of about 20. Tradition maintains that she came to meet him in secret wrapped in a linen sack, and that Caesar, susceptible to feminine wiles, was immediately captivated by her.

Roman forces won the war, in the course of which Ptolemy XIII was killed. Caesar restored Cleopatra to the Egyptian throne and had her married to her other younger brother Ptolemy XIV, ostensibly to rule jointly with him. It is after this that Caesar and Cleopatra took their legendary Nile cruise to explore the country of Upper Egypt, an episode which has been much romanticized in recent times. No details about this trip survive, but when Caesar left Egypt sometime in 47 BC, Cleopatra was pregnant, allegedly by him. Later that year she gave birth to a son, known as Caesarion ("Little Caesar"). In 46 BC, for reasons which remain obscure, Cleopatra and her son followed Caesar to Rome, where they remained until his assassination on the Ides of March in 44 BC.

After the murder of Cleopatra's great champion and protector, the queen returned to Alexandria. She engineered the murder of her brother Ptolemy XIV and installed her young son on the throne with her as Ptolemy XV. The political consequences of Caesar's murder were great. One of his major supporters was Mark Antony, who allied himself with Octavian, Caesar's great-nephew and posthumously adopted



Cleopatra: relief from the temple at Dendera, Egypt, showing Julius Caesar and Cleopatra, with their son Caesarion between them

son, against Caesar's assassins. After their defeat of the assassins, Antony and Octavian divided the territory of Rome between them, but gradually fell out with each other to the extent that civil war again ensued. Antony, whose power base was in the east, summoned Cleopatra to meet him in Cilicia in 41 BC. Ancient sources describe Cleopatra arriving in her spectacular state barge at Tarsus adorned as Aphrodite, having cunningly calculated the effect of her appearance and such a dramatic arrival. Although Antony was by now a mature man in his 40s married to his third Roman wife, he was instantly smitten by the queen. She invited him to a sumptuous feast aboard her barge, and was lavishly entertained by him the following day.

Antony and Cleopatra spent the following winter together at Alexandria, enjoying a life of luxury, the extravagant Ptolemaic court life clearly appealing to the self-indulgent Roman. Cleopatra bore him twins (a boy and a girl) in 40 BC. Antony left Egypt to deal with events in Rome, taking as his fourth wife Octavian's half-sister Octavia in an attempt to improve relations with his rival. There is no evidence that he saw Cleopatra again until 37 BC, when he met her in Syria. It appears that their relationship was further consolidated, though it stopped short of marriage since Antony was still legally married to Octavia. He acknowledged his paternity of their twins, and Cleopatra bore him another son the following year.

Relations between Antony and Octavian worsened, no doubt hastened by this insult to Octavia. Antony campaigned in Parthia and Armenia, with varying results, but the final break with Octavian came after a ceremony in Alexandria in 34 BC, known as the Donations of Alexandria. At a grand spectacle Cleopatra was confirmed as queen of Egypt and the surrounding lands in conjunction with her son Caesarion, and the rest of the eastern territories were divided between the two sons of Antony and Cleopatra. By this act Antony and Cleopatra claimed dynastic succession for their children even as he granted Roman territories to the half-Egyptian princes. War with Octavian was now inevitable, and large forces were mustered.

The combined forces of Antony and Cleopatra were defeated by Octavian in the naval Battle of Actium (off the west coast of Greece) in 31 BC. The tactics of the battle have occasioned great debate, but Cleopatra's ships, lined up behind those of Antony, fled the scene through a gap in the battle lines and headed for Egypt. In despair, Antony followed her, his ships were captured, and his land forces gradually defected to Octavian. The campaign was lost. It only remained for Octavian to capture his two foes.

Antony and Cleopatra slowly returned to Egypt, and resumed their relationship. They spent the winter of 31 BC in Alexandria in a life of profligate luxury, reminiscent of the early days of their courtship. They made plans for further warfare even as Octavian approached Egypt. Various embassies were sent to Octavian. Some sources attest that Octavian secretly told Cleopatra that he would spare her if she betrayed Antony; others that Octavian pretended to be in love with Cleopatra so that she would not kill herself and burn the colossal treasure which she had collected in her unfinished tomb. In any event, it appears that Cleopatra was terrified of capture and being forced to march as a captive in Octavian's Roman triumph, which the victor clearly intended.

Egypt was attacked in 30 BC, and Antony was ultimately unable to stave off defeat when many of his land and naval forces deserted to Octavian. At the news of the final defeat, Cleopatra locked herself and her servants into her tomb and apparently sent out a message to Antony that she was dead. Antony killed himself with his sword, and some days later, despite Octavian's efforts to keep her alive, Cleopatra was found dead in her tomb, allegedly killed by the bite of an asp although rumours of poison were known.

Cleopatra's death ended the rule of the Greek Ptolemaic dynasty of kings in Egypt, and the country became a province of Rome. It was her fate, for good or ill, to come into contact with two of the most powerful Romans of their day, and her love affairs with them have ensured her undying fame. In hostile Roman sources Cleopatra was depicted as an eastern witch who had seduced two noble Romans, yet she was a Greek and only the first of her dynasty to speak Egyptian. Her political cunning and capacity for survival, whether as victim or manipulator, meant that Egypt remained Greek and inde-

pendent from Roman rule for longer than the other Hellenistic empires.

Climate

Greece has a Mediterranean-type climate similar to that of Spain or California, with harsh dry summers (the dead season) and warm wet winters (the growing season in the lowlands).

The year begins in September, when clouds start to gather and the sun no longer burns so relentlessly. The first rains, coming one to ten weeks later, awaken plant growth for the winter. Frost and snow are rare but significant: olives cannot be grown in hollows where cold air gathers. Soil moisture typically reaches a maximum in spring; then the rains tail off, the heat of the sun rises, and evaporation increases. Many plants settle down to their summer dormancy, but some – notably the vine – are less well adapted to the climate and remain active through the dry season, their deep roots extracting water from the bedrock.

Greece is the land of lazy days in the crushing sun of a summer beach, and active days in the genial warmth of a southern winter; but also of people dropping dead from heat in the streets of Athens, or drowning in a flash flood in an arid Cretan gorge; of distant mountains glittering with snow; of the clammy mists from which the volcano island Santorini draws its moisture; of fire-storms jumping gorges, blasted by the October sirocco; of mules struggling through the snow in the high passes of Crete in July. Deluges are rare but very significant: once in a lifetime half a year's rain falls within a day or two and transforms a landscape.

Greece in general has a wet west side and a dry east side. The areas frequented by tourists are mostly dry, especially the islands. Athens, in the east, is one of the driest cities in Europe; Olympia, Patras, and Corfu, in the west, are relatively wet. High mountains distort the pattern; each one has a rain-excess on its northwest side, where the rain-bearing winds strike it, and a rain-shadow on the southeast. The southeast corner of Crete has less than 300 mm of annual rainfall; the high mountains probably get over 2000 mm, most of it as snow. One can have the illusion of going from Wales to Morocco in an afternoon's walk.

At high altitudes plant growth is limited by winter cold as well as summer drought. In the Pindus the growing season may be as short as two months: cereals and vines can be grown there but not olives. Modern Greeks cannot bear the cold, and flee from it if they possibly can. The highest all-year settlement is at 900 m, less than half as high as in the Alps, and a little higher than in Norway; anything higher calls for transhumance. Settlement has been much higher in prehistory.

Dust is a significant factor. It is picked up by storms in the Algerian Sahara and is transported in the upper atmosphere, to fall as a "red rain" of mud, especially in Crete. Over the centuries this has been an appreciable addition to the soils of the island, and may contribute to Crete's unexpected fertility.

Has the climate always been so? Records of unusual weather are fairly copious from islands in later phases of the Little Ice Age (1590s and 1690s AD). These were decades of extreme weather – cold, heat, drought, deluges – greater than anything that seems to occur now. Crete then had many more permanent rivers than today.

Climatology was already a discipline in ancient Greece. Theophrastus' best surviving work was in this field. Unfortunately the interest of ancient philosophers in theories rather than data means that they have little to tell us. The climate of ancient Greece was not grossly different from what it is now, but without instrumental measurements it is impossible to verify whether the climate – as opposed to unusual weather – was quite the same. If the ancient Greeks really went naked as on vase-paintings, they should have shivered in the chill damp of spring and been tortured by sunburn. (Modern Greeks are fully clad, and enjoy shade and the summer night.) It is an open question whether the clear atmosphere attributed

by modern writers to ancient Greece, unlike the hazy, often murky atmosphere usual today, is merely a proverbial platitude, or whether there has really been a change.

It is often conjectured that some change or other in early human affairs, for example the decline of the Mycenaeans, was due to a change of climate, such as drought. These claims lack independent evidence. There is, however, some evidence that winter snow was then less rare than it is now, and vegetation zones possibly lower. Theophrastus makes the definite (though secondhand) statement that settlement and cultivation reached higher into the mountains of Crete in the past than in his time.

The present Mediterranean climate, however, is not very much older than Greek history. During the ice ages, up to 14,000 years ago, Greece was drier and colder than it is now. There was then a period of wetter, less strongly seasonal climate than today, when northern trees such as lime and alder were common down to the south of Greece and even in Crete. The change to something like the present climate began in the 5th millennium BC and was completed in the Bronze Age. Agriculture, coming after the change, is reasonably well adapted to a summer-dry climate (except in the case of the vine), whereas wild vegetation has not had time to adapt and copes as best it may. Not many Greek trees lose their leaves in summer as one might expect.

Coinage

Ancient Greek coinage developed in Asia Minor, probably influenced by the circulation of Lydian coinage in the 7th century BC. The production of Greek coinage grew as the polis flourished and spread throughout the Mediterranean during the height of the colonization phase between *c.*700 and *c.*500 BC. As a result, coinage in antiquity was an essentially Greek phenomenon and became a medium of exchange, the legacy of which remains with us today.

Money had existed long before the introduction of coinage. But it is less clear in the Greek world, at least, what exactly constituted money. We know that bars of precious metal were used as currency in the 8th century BC. Smaller payments, which required smaller denominations of coinage than were offered by early silver coinage, were probably served by other forms of money. Arrowheads, for instance, were used from the mid-6th century BC in the Black Sea area.

The earliest known Greek coins belong to the 6th century BC, but our knowledge of them is limited by the availability of good, datable archaeological contexts. The earliest archaeological evidence for the existence of coins dates from the middle of that century at the temple of Artemis in Ephesus. The coins of the Lydian king Alyattes, of a gold and silver alloy called electrum, were marked and punched with designs. Most Greek coinage was to be made of silver. Electrum was retained by a few cities (e.g. Cyzicus, Mytilene, and Phocaea) and then only until the 4th century BC.

It is clear that by *c.*500 BC silver coinage had been adopted by Greek cities throughout the Mediterranean – in Greece, Italy, Sicily, and the Hellenized parts of the Achaemenid empire, primarily western Asia Minor. It was not until the conquests of Alexander the Great in the third quarter of the 4th century BC that we see the further expansion of Greek coinage into Babylonia, Bactria, and eventually India (Cribb 1983). Rome also began to imitate Greek coinage at the end of the 4th century BC (Howgego 1995, p.10).

The introduction of coinage has yet to be explained conclusively. Some have suggested that coinage was required to pay mercenary soldiers employed in campaigns, others that coins were used to facilitate large payments by and to states (Cook 1958; Kraay and Jenkins 1976, pp.317–28). Such speculation was limited until recently by the absence of small-denomination coins, but new examination has revealed in some quantity evidence for fractional coinage at least for the late 6th and 5th centuries BC. Small denominations have appeared so far only for silver coins: these small issues discovered would still retain some value, for example the smallest electrum coin represented a day's wages (Kraay, 1964). It is only with the introduction of base metal coinage, such as bronze, apparent in Greece from around the mid-5th century BC, that one can start to think of a more diverse role for coinage.

The development and spread of Greek coinage are inextricably linked with the development of the polis and the increase in the political and economic forces of Greek-speaking communities in and around the Mediterranean. The payments made by these city states were clearly facilitated by the development of coinage. Civic coinage was validated by markings that confirmed the value and legitimacy of the state's coinage; the Greek word for coin – *nomisma* – was linked to the legitimizing authority through the laws – *nomoi* – that regulated production. However not all Greek coinage was produced by states; often individuals issued coins, acting as or representing "states". The number of individuals issuing coins exploded at the end of the 4th century BC. Ptolemy I established a precedent for the other Hellenistic kings by having his portrait put on the obverse of Egyptian coinage around 305–304 BC.

Designs on Greek coinage were synonymous with the issuing city or authority. Towards the end of the 6th century BC Athens produced coins with an owl depicted on the reverse. The bird was associated with their tutelary divinity Athena – she appeared on the obverse – and the coins soon became known as "owls". Other states had their civic designs struck on the obverse: Aegina had a tortoise, Corinth a colt. Later in the 4th century BC the monarchic leaders were to introduce their own image on to the obverse face of their coinage. Coinage from the end of the 4th century BC becomes much more closely associated with individuals, typically the Hellenistic dynasts. In the later Hellenistic period the names of eponymous officials stamped on coins allows greater precision in dating.

Coinage was one way for a city or a ruler to extend his identity through the coin types. The circulation of coinage provided a useful means of conveying ideas and meaning. Coins were therefore an important means of spreading propaganda and political messages. Around 405 BC the cities of Rhodes, Cnidus, Iasos, Samos, Ephesus, Cyzicus, and Byzantium issued coins with the same obverse type of Heracles strangling a serpent, while retaining their own civic design on the reverse. By sharing the same coin type, these cities were able to display their support for Sparta. Under the leadership of Lysimachus, of Heraclid descent, they had defeated Athens, represented by a snake symbolizing Cecrops, the founder of Athens (Howgego 1995, p.63; Karwiese 1980).

Greek coinage circulated over a wide geographic area. The most popular coins in the Classical period were the Athenian silver "owls". Most coins were made from precious metals and their value equated loosely to the content of metal in the coin. Not all Greek cities observed the same weight standards, however; thus an Athenian, Corinthian, and Aeginetan drachma were all of different weights. The Athenian silver coinage was made from metal of a higher silver content than any other contemporary Greek coin. This, and the political might of Athens that the city enjoyed thanks to its 5th-century BC empire, ensured that its coinage was established as one of the most important issues in the Mediterranean. The Athenian weight standard eventually became the norm for many of the Hellenistic kingdoms from the end of the 4th century BC. The use of the Athenian system for Alexander issues preserved this weight standard in some areas until the 1st century BC. Posthumous Alexander issues remained popular for much of the Hellenistic period.

Reducing the weight standard was one form of monetary manipulation. Debasing coinage is known; Athens introduced a "copper" currency around 406 BC (Howgego 1995, p.111). A more familiar ploy was to reduce the precious-metal content in the coin. Ptolemy I introduced major reforms to Egyptian coinage between *c.*310 and *c.*290 BC, abandoning the Athenian weight standard and eventually lowering the weight of his silver tetradrachm by nearly 20 per cent. Egypt operated a closed economy, and all coinage had to be exchanged for local issues, a development paralleled within the Attalid kingdom at the start of the 2nd century BC.

Many Greek coin producers lacked local silver resources. Rich local deposits of precious metals were available in some areas. The Athenians in the Laurium hills of southwest Attica, those on the island of Siphnos until the flooding of the mines in the 5th century BC, and the people of Thrace, Macedon, and Thasos all had access to supplies of precious metals. At Pangaeum, in Thrace, east of Amphipolis, Philip II of Macedon increased the extraction of the silver and gold from the mines after 356 BC. His son Alexander the Great used the metal to produce coins that were to circulate over vast distances and dominate the Hellenistic world. But good local metal supplies were not always necessary for the widespread circulation of coin: the distribution of Corinthian and Aeginetan issues in the Archaic and Classical era indicates that commercial activity was the main reason for the spread of their coinage.

Coin production took place in mints. Skilled craftsmen produced the designs for the coins on metal dies, which were used to punch the desired image on to the two sides of the coin or flan. It was normal for one of the two dies to be gripped in an anvil. The impression made on the coin by this static die is known as the obverse; the other side of the coin is known as the reverse and the image here was created by striking the die on the upper side of the flan. The dies used to strike coins would eventually deteriorate and sometimes break; the lower die would almost always have the longer life expectancy. A number of "new" coins were produced by striking new images on to existing coins. Such coins are known as "overstrikes".

Mints could also copy the designs of other coins. A number of cities in Sicily and south Italy were particularly famed for the quality of their coins and the types used were imitated throughout the Mediterranean. The head of Arethusa, which appeared originally on a Syracusan issue created by the famous engraver Cimon, was clearly imitated in the shape of the nymph who appeared independently on 4th-century BC coins at Larissa in Thessaly and at Tarsus in Cilicia. A number of coin producers imitated the designs and types of other cities: the Athenian silver tetradrachm was copied in Babylon, Phoenicia, and Egypt during the Classical period.

Coin distribution evolved with changing political and economic circumstances. So the rise of the Hellenistic kingdoms from the late 4th century BC marked a significant shift. Two levels of coin circulation can be observed. Coins issued by the monarchs enjoyed a far wider international acceptability than those of many of the smaller Greek cities. The exception in the Hellenistic period was probably Athens which revitalized its coinage in the 2nd century BC with the production of the so-called New Style Athenian coinage. Like Rhodes, Athens continued to issue a silver coin down to the 1st century BC.

From the 4th century BC more local bronze coins were issued in Greece, and these enjoyed considerable regional success, rarely being found outside their immediate centres of production. The bronze issues played a major role in the local economy and coins were minted for specific religious festivals, such as the Eleusinia in Attica. Bronze issues increased and were widely employed by Greek cities as Rome dominated Greek politics from the early 2nd century BC.

The federal Greek states became important producers of coinage in the Hellenistic period; in Asia Minor Greek cities continued to mint coins following the treaty of Apamea. By the end of the 1st century BC many Greek cities were no longer issuing their own distinct coinage. By this time, and throughout the 1st–3rd centuries AD, local Greek coins had taken on the appearance of Roman coins and were restricted to being struck in bronze. Under the Roman empire more Greek-speaking cities in Asia Minor were issuing coins than at any other time in antiquity. In the 3rd century AD the local production and circulation of provincial bronze coins issued by Greek cities reflects considerable economic developments within the Roman empire.

The coinage of the Byzantine period continued to be influenced by the coins of the later Roman empire. Copper, silver, and gold were minted but there were periods when one or other of these metals fell into disuse. Silver coins are less common in the 5th and 6th centuries AD. Initally Latin dominated the coinage of the Byzantine period, but eventually Greek took hold from the 7th century and had largely replaced Latin by the 11th century. Byzantine coinage drove the

economies of the 4th to 7th and 11th to mid-13th centuries and made Constantinople the centre of a prosperous empire.

The legacy of ancient Greek coinage for the development of coinage in modern Greece is considerable. The use of images and terms from antiquity on modern Greek coins does reflect the enormous heritage of the past. In this, of course, Greece is similar to many other countries that illustrate their own history and culture on their coins and banknotes. But for Greece there is particular importance attached to the ideology of Hellenism. The very Greekness of modern Greece is established by connection with its ancient history. The role of Alexander the Great as a force unifying the Hellenic world is as strong today as it was in the 4th century BC.

Colonization

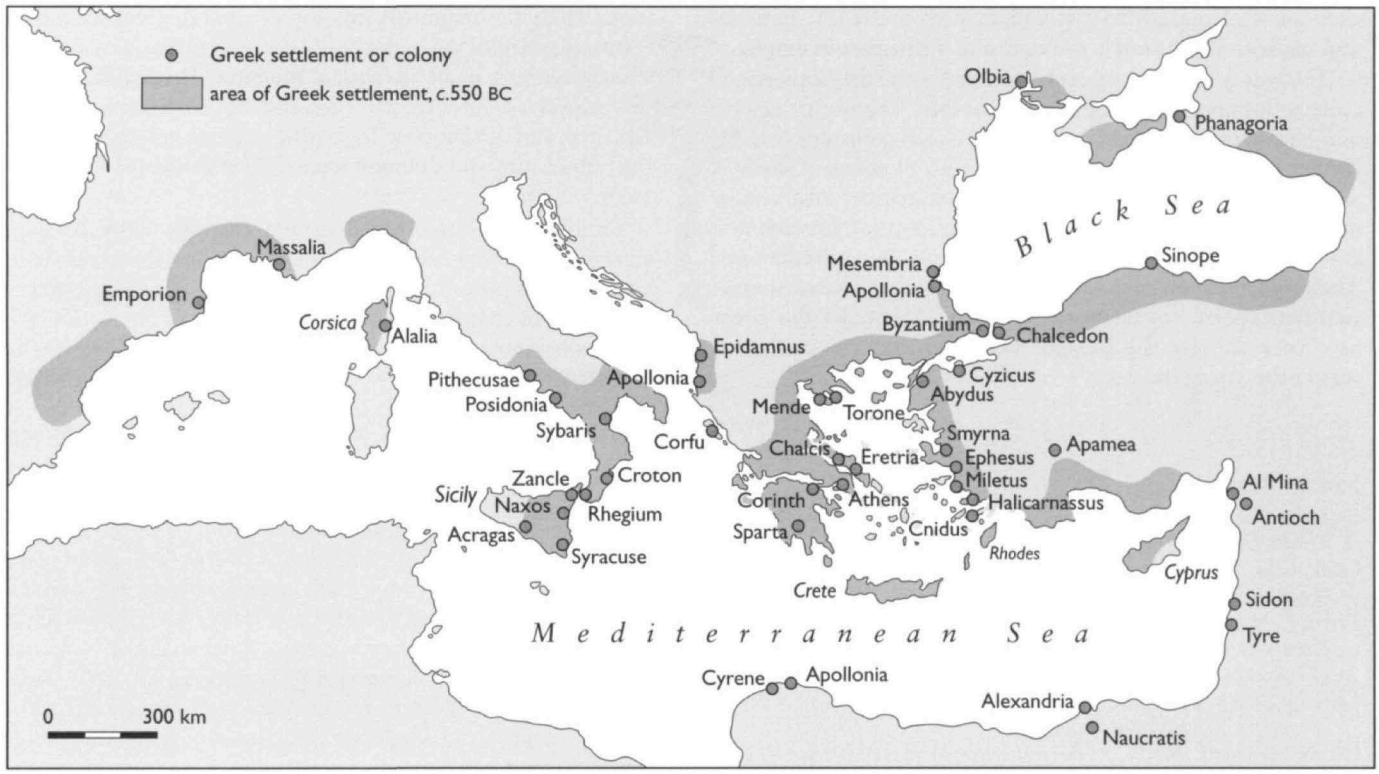
It should be remarked at the outset that the term "colonization" to describe Greek expansion throughout the Mediterranean and Pontic areas is a coinage of modern scholarship. It is employed by historians to indicate the process whereby, from the 8th century BC through to the Hellenistic era, Greek cities took collective and conscious decisions to plant sections of their population on foreign soil under the leadership of an *oikistes* (founder) who was responsible for the distribution of land plots to his fellow colonists and the transfer of metropolitan cults to the new civic foundation which was generally independent of its metropolis (though Corinth seems to have continued to exercise some authority over its colonies). There are, however, three difficulties with this conventional definition.

First, while in modern historiography the colonizing process is distinguished sharply in both chronological and definitional terms from the migratory traditions regarding earlier movements of peoples such as the Dorians, Ionians, or Aeolians, ancient authors made no such distinction. Thucydides (1. 12. 4), for example, uses the same terminology to describe both the Athenian colonization of Ionia (the "Ionian migration") and the 8th-century BC Peloponnesian colonization of Italy and Sicily.

Secondly, it is not at all certain that the early colonial ventures of the 8th century BC were as organized and public in nature as the prevailing orthodoxy upholds. A case in point is the late 8th-century colonization of south Italy which the sources attribute to cities in Peloponnesian Achaea despite the fact that there is neither literary nor archaeological evidence for Achaean cities much before the 5th century BC. The fact is that the "mechanics" of early colonization are often and all too uncritically retrojected from foundation decrees of later periods, particularly those concerning the foundation of Naupactus (first quarter of the 5th century BC), Brea (third quarter of the 5th century BC), Black Corcyra (4th century BC), and Cyrene, where it is impossible to gauge the extent to which a 4th-century decree replicates–as it claims–an original foundation decree of the later 7th century BC (though the weight of scholarly opinion inclines towards scepticism). Similarly, literary accounts for colonial foundations rarely predate the 5th century BC: thus, the developed tradition concerning the founding of Cyrene (which is frequently–though not unproblematically–regarded as a "model" for colonial foundations in general) is not attested before Pindar and Herodotus (see further below). A related point concerns the chronology of foundations. Thucydides (6.3–5) gives dates for the earliest colonies of Sicily while a more complete list is presented by Eusebius of Caesarea (late 3rd century AD). In neither case is the source of their information certain nor how they reckoned their dates. Archaeological investigation can certainly assist in answering this question, though the commencement of colonial activity–as opposed to less formal transactions of trade or exchange–is not always immediately apparent in the material record and in any case our ceramic chronologies are based in part (and more than is often admitted) on the Thucydidean and Eusebian dates. In general, the probability is that the origins of the earliest colonies were more haphazard, mixed, and gradual than is often stated.

Thirdly, while it would be unsound to regard Mycenaean material objects found in south Italy, Sicily, and the Aeolian islands as reflections of an early Mycenaean colonization of these areas (Mycenaean material is also found well inland in Anatolia), it does now appear that colonial activity may in some instances predate the 8th century. Thucydides (4. 123. 1) regards the city of Mende in Chalcidice as a colony (*apoikia*) of Eretria and it has often been assumed that Mende along with Torone (also in Chalcidice) were Euboean foundations of the Archaic period, but recent excavations at both sites have recovered Euboean and Euboeanizing material that dates back as far as the 10th or even 11th century BC. It is possible that this colonial activity represents a "rehearsal" for the more numerous and distant colonies planted in the west in the 8th century.

Indeed, the Euboeans of Eretria and Chalcis appear to have been prominent participants within the early colonization of the west. Both are said to have founded Pithecusae on the



11. Areas of Greek settlement from the 8th to the 3rd century BC

island of Ischia in the Gulf of Naples (Strabo, 5. 4. 9) with the Chalcidian element transferring to Cumae on the mainland opposite (Livy, 8. 22. 5–6): archaeological evidence suggests a date of about 775 BC for Pithecusae and 725–700 BC for Cumae. According to Thucydides (6. 3. 1) the first Sicilian colony, Naxos, was founded by Chalcidians under the leadership of Theocles in 734 BC, with Leontini and Catana following in 729 BC, while a Euboean presence is attested before the end of the 8th century at Zancle and Rhegium on either side of the Straits of Messina. Corinthians under the Bacchiad Archias are said to have founded Syracuse in 733 BC (Thucydides, 6. 3. 2)–a city which was to participate in the "secondary" colonization of Acrae and Casmenae in the mid-7th century and Camarina at the beginning of the 6th century BC. Megara Hyblaea was supposedly founded in 728 BC by Megarians who had failed to settle Leontini (Thucydides, 6. 4. 1) and established its own colony at Selinus a century later. Rhodes and Crete are said to have founded Gela in 688 BC (Thucydides, 6. 4. 3), followed in 580 BC by Gela's foundation of Acragas (Strabo, 6. 2. 5). Finally, Achaeans are credited with the foundation of several colonies in south Italy–including Sybaris and Croton towards the end of the 8th century, Metapontum and Caulonia in the second half of the 7th century, and Posidonia in the early 6th century–while Tarentum was founded by Spartan dissidents in the last decade of the 8th century and Epizephyrean Locri by Locrians in the early decades of the 7th century BC.

The second major area of early colonial activity was in the region of the Hellespont, Propontis, and Black Sea. Milesian foundation is attributed to Abydus on the Hellespont (670 BC?), Cyzicus in the Propontis (756 BC?), and Sinope (631 BC?) together with a host of other colonies in the Black Sea; Miletus is also said to have participated with Paros and Erythrae in founding Parion in 709 BC. The Megarians planted the colonies of Astacus, Chalcedon, Selymbria, and Byzantium at the eastern end of the Propontis in the course of the 7th century and collaborated with the Boeotians in founding Heraclea Pontica *c.*560 BC. Towards the end of the 7th century, the Athenians founded Sigeum on the Hellespont and Samos established Perinthus on the northern shore of the Propontis, while the Tean colony of Phanagoria on the northern shores of the Black Sea probably dates to the mid-6th century BC.

In the far west, settlers and refugees from Phocaea are credited with the foundation *c.*600 BC of Massilia in southern France and Emporion in Spain. In the northern Aegean, the Chalcidice peninsula was settled by Eretrians, Chalcidians, Achaeans, Corinthians, and Andrians while Paros led a Panhellenic venture to colonize Thasos in the mid-7th century and Samians are said to have settled Samothrace in the second half of the 6th century BC. Finally, Libyan Cyrene is said to have been colonized by Thera *c.*630 BC and archaeological evidence suggests that other settlements were established in Libya at Tocra, Euhesperides, and Barca from the last third of the 7th century to the middle of the 6th century BC.

The motives for early colonization are the subject of scholarly controversy and it is probably unwise to insist upon unicausal factors. Some colonies may have been established for the purpose of exploiting trading opportunities, though most were situated on headlands and estuaries in possession of fertile plains, so it may be that the increased sedentary conditions of mainland Greece in the 8th century (together with consequent demographic increase) led to a shortage of agricultural land at home–certainly the Theran version of the foundation of Cyrene claims that a seven-year drought prompted the

consultation of the Delphic oracle which instructed the Therans to colonize Libya (Herodotus, 4. 151). Alternatively, since the early colonial ventures appear to coincide with the crystallization of the polis or "city state", it may be that the inclusionary/exclusionary process through which the community of citizens emerged inevitably resulted in social disaffection on the part of those who found themselves excluded or dissatisfied: in the Cyrenean account concerning the origins of Cyrene, the founder Battus is said to be the illegitimate son of a Theran aristocrat and a Cretan princess (Herodotus, 4. 154–55), and similar imputations of illegitimate birth may be inferred from the name of the Spartan Partheniai ("maiden-born") who are said to have colonized Tarentum (Strabo, 6. 3. 2).

It is most unlikely that prospective colonists were entirely ignorant of their destinations. A small quantity of Protogeometric (10th-century) material has been recovered in the region of Tarentum while Greek cups dating to Middle Geometric II (early 8th century) are attested at Etruscan Veii; Cumae, Capua, and Pontecagnano in Campania; Scoglio del Tonno in Puglia; and Villasmundo in eastern Sicily. This would suggest either direct knowledge of the west on the part of Greek traders or at least indirect knowledge passed to Greek manufacturers by mercantile middlemen (probably Phoenicians). In some instances colonies were established on virgin soil (e.g. Pithecusae)–sometimes with the explicit blessing of neighbouring indigenous populations (Megara Hyblaea, Cyrene)–though on other occasions the colonizing effort required forcible occupation of the land (Thasos) and often subjugation of the former population (Syracuse, Heraclea Pontica). Though a matter of controversy, it is probable that intermarriage fostered greater integration between new colonists and indigenous populations: Herodotus (1. 164–65) states that wives accompanied the Phocaeans who attempted to colonize Corsican Alalia, though in his description of the foundation of Cyrene (4. 153)–as well as the Athenian "colonization" of Ionia (1. 146.2–3)–there is mention of men only so the likelihood is that the colonists, who were normally young men, took indigenous wives upon their arrival at colonial sites. Diodorus of Sicily (5. 6. 5) explains that the native population of Sicily eventually adopted the Greek language and educated their children according to a Greek model and it is this "Hellenization" of Sicily and south Italy that would later exercise such a profound influence on the culture of the Romans.

Colonization continued–albeit on a reduced scale–throughout the Classical period. In the early 5th century eastern Locrians established a colony at Naupactus; in the 440s BC Athenians settled Brea in Thrace and participated in the collective foundation of Thurii on the site of ancient Sybaris in southern Italy; and in 426 BC the Spartans issued a general invitation for Greeks (with the exception of the Ionians, Achaeans, and some others) to join them in the foundation of Heraclea Trachinia in central Greece (Thucydides, 3. 92). For the first time, contemporary literary and epigraphic testimony reveals the precise workings of colonial ventures in this period, from consultation of the Delphic oracle seeking approval for the expedition to the provisions for choosing an *oikistes*, recruiting colonists, and formalizing the relationship between the mother-city and its colony as well as providing for the right of return in the event of colonial failure. It is debatable whether the practices attested in this period had also operated in the case of the earliest colonies: the literary accounts for the earlier foundations which were first consigned to writing at this time (though they are frequently preserved only in later sources such as Diodorus of Sicily) are characterized by recurring tropes – many focusing on the "outsider" status of the *oikistes* who is directed to found a colony when consulting the Delphic oracle on a completely unrelated matter–and it is tempting to believe that individual traditions were selectively moulded to fit this new genre of foundation stories. Indeed careful reading of literary accounts reveals the existence of multiple traditions in which colonial origins are attributed to varying populations and *oikistai* (both mortal and heroic) and oracular sanction sought from other sanctuaries besides Delphi. Colonial traditions were never transmitted for their own sake but to justify and legitimate claims to power and recognition in the present.

From the end of the 6th century BC, Athens began to found a new type of colony named a cleruchy. Although ancient authors often fail to make any terminological distinction between a cleruchy and a colony, the chief difference would appear to reside in the fact that, while colonies were normally established as autonomous foundations, residents of a cleruchy remained Athenian citizens, though the situation is complicated by the fact that later residents of Athenian colonies also often retained citizenship at Athens. In general, the function of the cleruchy seems to have been to act as a garrison over populations that were deemed hostile to Athens. Cleruchies were established at Chalcis and Salamis in the late 6th century; Andros, Chersonesus, Lemnos, Imbros, and Histiaea in the mid-5th century; Aegina, Lesbos, and Melos in the last third of the 5th century; and Samos in the mid-4th century.

A renewed wave of colonization was initiated by Alexander the Great and his Hellenistic successors, especially in Babylonia (Seleucia on Tigris), northern Syria (Antioch, Apamea), Asia Minor (Laodicea), and central Asia (Ai Khanoum). These colonies normally served the function of garrisons and were populated by both Greeks and Macedonians, though the new city of Alexandria, founded west of the Canopic mouth of the Nile Delta in 331 BC, was granted full civic status. Its original citizens were Greeks of various origins, but the city also had a large indigenous Egyptian and Jewish population.

Comedy

Greece has furnished us with the earliest literary examples of comedy. As a form of popular entertainment, Greek comedy is probably of greater antiquity than tragedy. The origin of the word has been connected with *komos*, meaning "a band of revellers". Their processions, with unrestrained singing and jesting, were held in honour of Dionysus, so that comedy or "the song of the *komos*", like the tragedy and the satyr play, may have had its origin in the festivals of Dionysus. Tradition attributed its invention to the Dorian inhabitants of Megara, from where it was supposed to have spread to other Dorian communities.

In chapters 4 and 5 of the *Poetics* Aristotle gives a rather cursory account of the origin and development of comedy. The gist of his account is: the Megarians, both of Sicily and of the isthmus, claim to have originated comedy; its name is (erroneously) derived from *kome* ("village"); its origin lay in the preludes to the phallic songs; the steps by which it developed are uncertain; the Sicilians introduced plots in place of mere lampoons; and comedy took longer than tragedy to receive recognition in Athens.

The transformation of the local Doric farce of Sicily into a literary form is attributed to Epicharmus of Cos (*c.*540–450 BC). Other representatives of early Dorian comedy appear to have included his contemporary Phormus or Phormis and Dinolochus, said to be a pupil of the latter. The introduction of comedy to Attica (*c.*580 BC) is credited to Susarion, who is said to have transplanted it to the Attic deme of Icaria, which is known to have been the principal centre of the worship of Dionysus in Attica, and the home of Thespis, the pioneer tragic poet, as well as of Chionides and Magnes (*c.*550 BC), who are said to have given Megarian comedy a more artistic form. Its adoption at Athens during the time of the Persian Wars ensured for comedy a place in literature. At Athens comedy became an official part of the celebration of Dionysus in 486 BC.

The evidence suggests that the ingredients of the old Attic comedy came from sources widely differing in place and time. The existence of "animal choruses" is attested by an Attic black-figure amphora of the mid-6th century BC, which depicts men disguised as horses, with riders on their backs, accompanied by a flute-player, and a 5th-century Attic vase showing men dressed as birds. Vases of the 6th century also depict grotesque satyrs as well as dancers whose dress is exaggerated behind and in front for humorous effect. The unrestrained personal abuse and gross sexual humour are anticipated in the poems of Archilochus (7th century BC) and Hipponax, and need not be traced solely to Dionysiac rituals. The dramatic element may have been derived from the secular Dorian comedy without chorus that is said to have originated in Megara and been developed by Epicharmus at Syracuse.

The earliest phase of ancient Greek comedy is known as "Old Comedy". In practice, this term refers to the comedies produced at Athens during the 5th century BC. These plays are characterized by unrestrained satire of public persons and affairs, extremely irreverent treatment of mythology and the gods, outspoken political criticism and comment on literary and philosophical matters, as well as sexually oriented humour. The actors wore grotesque masks, and their costumes, though based on the dress of everyday life, included artificial exaggeration for comic effect. The short tunic could expose the large phallus each carried. They also wore masks of certain easily recognized types. Female roles were played by men. Accordingly, nude or exposed women must have been costumed representations of the female body. Although Old Comedy transformed ritual into art, it still retained traces of its ritual origin: the prominence given to the phallus in the earlier plays; the final festive union of the sexes in a party or marriage; and the expressed or implied references to the reproductive organs.

The heyday of Old Comedy was during the time of Pericles and the Peloponnesian War when Athenian democracy had reached its highest point of development. Cratinus (*c.*520–*c.*423 BC) and his younger contemporaries Eupolis (*c.*446–*c.*411 BC) and Aristophanes are believed to have been the foremost writers of Old Comedy. Others include Crates, Pherecrates, Hermippus, Teleclides, Phrynichus, Ameipsias, Plato (not the philosopher), and Theopompus.

The plays were composed of a blend of song, dance, personal invective, and buffoonery, and consisted of loosely related episodes. The plot was set in contemporary Athens. In most plays of Aristophanes the protagonist conceives a fantastic plan that runs counter to the natural order of things. He is opposed by the chorus whom he eventually succeeds in winning over to his side. A series of short episodes then demonstrate the consequences of the realization of his fantasy for various professions and types, usually involving a series of acceptances and rejections, and the play usually ends in a festive spirit.

From a consideration of the 11 extant plays of Aristophanes (9 of which happen to be the only completely surviving examples of Old Comedy), we may infer that, gradually, a six-part structure evolved: (1) a *prologos* or introduction in which the basic issue of the play is explained and developed: the protagonist conceives an extravagantly imaginative but absurdly impractical solution to a problem; (2) the *parodos* or entry of

Comedy: a production of Aristophanes' comedy *The Birds*, directed by Karolos Kun, Epidaurus, 1975

the chorus; (3) the *agon* or contest between opposing principals, in which the hero defends his bright idea from attacks and invariably defeats his opponents; (4) the *parabasis* in which the chorus, on behalf of the poet, speaks to the audience and attacks prominent citizens: it consisted of an anapaestic passage followed by the *pnigos* (a long sentence to be uttered in one breath), an *ode* or invocation to a god, an *epirrhema* or satiric speech on current affairs, an *antode*, and *antepirrhema*; (5) a series of *epeisodia* or farcical scenes, usually without any sequential connection with each other but building up to a climax, lightly separated by songs of the chorus, demonstrating the consequences of the realization of the hero's fantasy both on the protagonist and on typical figures, but occasionally carrying on the main plot; (6) *exodos* or final scene of rejoicing generally leading up to a banquet or wedding.

Attic comedies, like Attic tragedies, were performed at the great festivals of Dionysus, namely, the Dionysia and the Lenaea. Their inclusion in the latter dates from shortly before 440 BC. Five comic poets competed on each occasion, each presenting one play (the number of competitors was evidently reduced to three during the Peloponnesian War, but this has been debated). In the 4th century comedies were also given at the rural Dionysia, but it is not known how far back this practice went.

Like a tragedy, a comedy consisted of the dramatic dialogue (for which the iambic trimeter was generally used) and the lyrical choruses. However, whereas the tragic chorus consisted of 12 (later 15) singers, the comic chorus included 24. They were often divided into two half-choruses. They wore masks and grotesque dresses to suit their parts (e.g. as birds, wasps, etc.), but removed their outer cloaks for the purpose of their dances. Their role was not generally one of reconciliation, as in tragedy, but of exciting the disputants and finally siding with the victor. On occasion, the entry of the chorus presents a moment of violence and excitement. It may be hostile to the protagonist who is faced with the task of winning them over to his side. Once this has been achieved, they applaud and reinforce what he says and does. The chorus played an important part in the Old Comedy, and, at least in the case of Aristophanes, several of the plays were named after their choruses.

The freedom of political criticism enjoyed by poets of the Old Comedy appears to have been occasionally curtailed, but it was not permanently lost until the downfall of Athenian

democracy in 404 BC. The loss of imperial power and political energy was gradually reflected by a choice of material of a less typically Athenian and more cosmopolitan nature. Most notable is the reduced importance of the comic chorus. The *parabasis* disappeared altogether, and the choral odes were replaced by interpolated pieces (*embolima*) not germane to the play.

The term "Middle Comedy", which is of Hellenistic origin, has been used to designate Attic comedies written between *c.*404 and *c.*320 BC. The term is used to describe these plays because they represent a transition from Old Comedy to New Comedy, both of which have certain features in common with it. Although plays with political themes were still produced, mainly (but not exclusively) in the earlier part of the period, and politicians such as Demosthenes and Callimedon were frequently ridiculed, broadly speaking Middle Comedy avoided outspoken political criticism and open attacks on individuals, and dealt instead with typical human faults and foibles. The authors concentrated on social satire and resorted to burlesque or parody of tragedy, mythology, and the lives of the philosophers, notably Plato and the Pythagoreans.

The observation of contemporary types, manners, and pursuits was a common characteristic. Typical characters of New Comedy, such as bullies, parasites (evolved from the flatterers of Old Comedy), cooks, pimps, soldiers, stern old men, young men in love, and courtesans figured in Middle Comedy as well, although some of them, such as the swaggering soldier, can be traced back to Old Comedy at least. Their occurrence leads us to conclude that New Comedy-type plots were also anticipated in Middle Comedy. Significant also in this connection is the impact of Euripides' plays such as the *Iphigeneia in Tauris*, the *Ion*, and the *Helen*. Middle Comedy represents a period of experiment and transition. Different types of play appear to have predominated at various times, so that one may not be justified in labelling one type of play as Middle Comedy to the exclusion of all others.

The most celebrated authors of Middle Comedy were Antiphanes of Athens and Alexis of Thurii, followed by Eubulus, Timocles, and Anaxandrides of Rhodes. It is interesting to note that many of the authors were of non-Athenian origin. They appear to have been extremely prolific. More than 800 of their plays are said to have survived as late as the 2nd century AD. Athenaeus, who has preserved the majority of fragments, mentions some 57 playwrights. However, no complete example has come down to us, but the last play of Aristophanes, the *Plutus*, no doubt reflects some of the changed features.

The period of New Comedy extends from about 320 BC to the mid-3rd century BC. Its main features are the representation of contemporary life by means of imaginary persons drawn from it, the development of plot and character, the substitution of humour for wit, and the introduction of romantic love as a theme. These plays were written largely during a time of political and moral disillusionment, when Athens was no longer a free state but had come under the sway of Macedon. Political references are rare and are subordinate to the depiction of the domestic life of fictitious characters.

New Comedy offers a mildly satiric view of contemporary Athenian society, especially in its familiar and domestic aspects. There is no parody of public figures and events as in Old Comedy. Instead we meet with representations of the private affairs of average but fictitious men and women depicted without supernatural or heroic overtones.

The common subject is the infatuation of a high-born young man for a slave girl. One of the lovers is usually a foundling, the discovery of whose true birth and identity finally makes their union possible. But the romantic element is not the only ingredient and is not very significant: the girl whom the hero wishes to possess does not always appear on stage, or when she does, she often does not speak. Intrigue (especially on the part of crafty slaves on behalf of their young masters) plays an important part in the plots of New Comedy, which are articulated to a far greater extent than those of Old Comedy. The names of the slaves (Getas, Libys, etc.) reflect the economic expansion in the wake of Macedonian conquest. The resulting cosmopolitan atmosphere is matched by the mobility of the people, who constantly go abroad, be it on business, mercenary service, or as the result of misfortune. Although the characters have fixed names and masks, they differ vividly and come to life as individuals, at least in the better plays. Athenian laws of citizenship and marriage are integral to many of the plays. Yet the universality of the characters, situations, and relationships makes the plays enjoyable to those far removed from Athens in time and place. Menander, in particular, excelled at the sympathetic portrayal of various personal relationships and problems arising from ignorance, misunderstanding, and prejudice, in all of which one can recognize his debt to Euripides.

The dialogues of New Comedy are in the usual iambic trimeter, but there are trochaic tetrameters and lyrical passages too that may have been performed by the actors themselves. The chorus is so diminished in importance as to become a small band of musicians and dancers periodically providing light entertainment. The language is Attic, but closer to the koine of everyday speech. The play was apparently divided into five acts by the four choral interludes.

The most famous exponent of New Comedy was Menander (342–292 BC). His surviving work includes one complete play, the *Dyscolus*, and considerable portions of three others: *Perikeiromene*, *Epitrepontes*, and *Samia*. Some of his other plays, as well as those of his fellow New Comedy writers (Diphilus, Philemon, Philippides, Posidippus, Apollodorus of Carystus), are known to us only through their Latin translations and adaptations by the Roman comic poets Plautus (*c.*254–184 BC) and Terence (195/185–159 BC). The original Greek texts circulated widely until the 7th century AD, but were then completely lost. Until the discovery of the Menander papyri, New Comedy was known only through quotations, Roman adaptations, and echoes in later Greek authors such as Alciphron and Lucian.

Greek theatre did not survive in Byzantium, although dramas (including comedies) were copied and transmitted in manuscripts and during the Palaiologan period a number of scholars wrote commentaries on the various works. Naturally, we encounter here and there in Byzantine texts phrases and expressions from the comic poets – especially in satirical works. But these are philological remnants, so to speak. In *Epistle* 150 Photios shows knowledge of Aristophanes' *Plutus*, which he is likely to have encountered in the school curriculum. By contrast, Menander was still being read in the school

at Gaza in the 6th century, but did not survive into the Middle Ages. Heliodorus wrote a commentary on the metres of Aristophanes, parts of which are found in the extant scholia. Among the sources most frequently used in the *Suda* are the text and scholia to Aristophanes, for which the *Suda* is in effect a fairly important witness. Of Eustathius' notes to Aristophanes no more is known than minute fragments preserved in late manuscripts. By the late 13th century it had become the custom to read three plays of each tragedian and Aristophanes, sometimes known as the "triad"; the habit may go back to the 12th century or earlier, for Tzetzes composed a full commentary on only the three Aristophanic comedies that later were standard reading, namely, *Plutus*, *Frogs*, and *Clouds*. The Ravenna Aristophanes is the only medieval manuscript to contain all 11 plays (Ravenna, Gr. 429). It has been suggested that Manuel Moschopoulos may have worked on a recension (possibly with annotations) of the Aristophanic triad since some scholia, especially on the *Plutus*, have been traced to him.

The pure Attic language of Aristophanes was studied and imitated by the ancient Atticists and their Byzantine successors. In his desire to create a modern Greek language, Adamantios Korais (1748–1833), the most important representative of the Greek Enlightenment, studied Aristophanic comedy with its rich linguistic heritage. However, these studies, as well as the earliest revivals of Aristophanic comedy, were affected by moral scruples: hence the relatively small number of translations, adaptations, and stage versions prior to 1900. For a long time Aristophanic performances were given by non-professional troupes both within and outside Greece, and this amateur spirit partly accounts for the high degree of audience appeal and participation associated with modern Aristophanic revivals in Greece. By the 1950s, however, the comedies had moved on to the official stage of the ancient drama festivals of Epidaurus (inaugurated 1954) and Athens (inaugurated 1955). The chief contributors to this promotion were Karolos Koun (1908–87) and his former student Alexis Solomos. These two directors, working independently and under widely differing conditions, set off a tradition of presenting the plays of Aristophanes to the large urban public, thereby ensuring their popularity in Greece.

Due to its contemporary relevance, revivals of Aristophanic comedy enjoyed vast success during the years of the military junta (1967–74), but declined in the two years following the fall of the dictatorship. There have been productions since 1977, but many of them have been characterized as events for tourists. However, during the same period, Aristophanic material has been put to alternative uses, such as Savvopoulos' musical version of the *Acharnians*, a shadow theatre adaptation of the *Birds* by P. Michopoulos in 1984, children's books and comics based on the plays, and productions staged in Greece by mostly English-speaking companies.

Commonwealth, Byzantine

The Byzantine Commonwealth was first identified and described by the Oxford historian Dimitri Obolensky. The term is best known from his important publication of 1971, *The Byzantine Commonwealth: Eastern Europe 500–1453*. This book examined the way in which people living outside the borders of the Byzantine empire encountered aspects of Byzantine life, whether cultural, political, economic, or religious. Obolensky argued that many Byzantine influences successfully passed beyond the empire's borders, to the extent that they were subsequently incorporated into the everyday life of people who were not "Romaioi" and who may themselves have had no direct contact with Byzantium. Indeed, he found the levels of "Byzantinization" to be so high that he felt justified in claiming that an international community had existed that shared extensively in the life of Byzantium, although it was not incorporated into the empire itself. This alleged international community was termed the "Byzantine Commonwealth".

By focusing principally on the transnational character of the Byzantine tradition, Obolensky was pioneering a new approach within Byzantine studies. Hitherto, much of the scholarly work on the international relations of the Byzantine empire had been conducted by those seeking to shed light on Byzantine foreign policy, or on other aspects of the political history of the empire itself. This new work, however, examined the Byzantine Commonwealth in its own right. It discussed the process of "Byzantinization" with a view to ascertaining its impact on the subsequent development both of its member countries and of the region generally. In seeking to move away from a historiography that laid undue emphasis on formal political structures in defining its field of study, Obolensky could be said to have been incorporating aspects of the "history of civilizations" approach into Byzantine studies.

The subtitle of Obolensky's book suggests that the Byzantine Commonwealth was contained within the eastern European region. This may be true of the period *c.*800–1453, when it can be agreed to have extended from Kievan Rus and the lands to the north of the Black Sea, across to the eastern part of Hungary and the Transylvanian plain, and then south across the Danube to Romania and the Balkan peninsula. In the Balkans, the commonwealth included Serbia, Bulgaria (except between 1018 and 1187 when it was officially incorporated into the empire as a "theme" – a unit of provincial government), and various other territories over which the Byzantines did not exercise direct administrative control. Obolensky did not, however, include Byzantine overseas "dependants" – such as Sicily, Apulia, and Venice – in his definition of the commonwealth. These were, de jure, included in the formal structure of the empire for at least part of the period that the book covers.

Over the course of the millennium the borders of the Byzantine Commonwealth underwent some significant change. As the geographical frontiers of Byzantium itself shifted, so too did those of the commonwealth. Some areas left the commonwealth for political reasons, such as Bulgaria when it was (albeit temporarily) absorbed into the empire. Others, such as Croatia, moved away from the commonwealth in cultural terms: its geographical position on the far northeast of the Adriatic littoral quickly exposed it to the influences of Latin Christendom. The result was that levels of "Byzantinization" in Croatia were never particularly high, and by the end of the 9th century Pannonian Croatia and some of Dalmatian Croatia were firmly orientated towards the West. Temporary acknowledgement of the Byzantine emperor's suzerainty by the Croats in the 11th century was not accompanied by the widespread adoption of other aspects of Byzantine culture. Conversely, some countries joined the commonwealth several centuries after its establishment. The lands that comprise modern Romania, for example, entered the commonwealth as late as the 14th century. Immediately before this their inhabitants were under the authority of the Hungarian princes, and prior to that the region had served as a temporary home to several different groups of peoples who were travelling west from the steppe. These latter groups did not form sedentary societies and so were more resistant to Byzantine influences, which were most attractive to societies at a higher level of political and social organization.

The constituent parts of the Byzantine Commonwealth were not, of course, homogeneous, even if they all comprised sedentary and centralized societies. They related both to the empire and to each other in sometimes very different ways, and where similar aspects of the Byzantine tradition *were* adopted, it was rarely at the same time. Profound differences in geography, history, economics, and political organization made sure of that. One should not be surprised, then, to discover that wars and violent conflicts were a common part of the political landscape of the Byzantine Commonwealth during the late antique and medieval periods. Indeed, one of the longest and most violent wars in eastern Europe took place between the empire and the country that had proved most receptive to Byzantine ideas and material goods: Bulgaria. For most of the 10th century these two polities were at war with each other, until 1018 when the Byzantine army finally defeated the Bulgarians and brought them under Byzantine subjugation. Clearly, a similar cultural tradition, even when that included similar ecclesiastical structures, education system, and political organization, did not prevent countries from waging war against one another.

Thus, the Byzantine Commonwealth was an organic entity; it was always in the midst of social and political changes, and the direction of the "Byzantinization" process was never fixed. A country could, for instance, be seeking political rapprochement with the empire's enemies, while at the same time increasing its demand for Byzantine products and developing a distinctly "Byzantine" artistic tradition. This was, for example, the case with early-13th-century Serbia as its ruler, grand zupan Stephan, sought to protect his political autonomy in the face of the Fourth Crusade. Although Stephan put himself under the religious authority of the pope in 1217, Serbia remained at the interface of East and West, and in economic and social terms started to move towards Byzantium. When, in the early 14th century, the territorial conquests of Stephan IV Dushan brought the country closer to Byzantine influences, Serbia became more entrenched in the Byzantine Commonwealth. In this way, the character of the commonwealth underwent significant change over the course of its 1,000-year history as its members responded to disparate events and circumstances. According to Obolensky's analysis,

the greatest transition period for the commonwealth was the mid-12th century, as it moved from being a community whose strongest links with Byzantium – apart from Orthodoxy – were political, to one in which the most prominent Byzantine influences were cultural.

Nevertheless, there *was* extensive continuity in the character of the Byzantine Commonwealth, principally in the area of religion. Member societies all shared in the life and work of the Eastern Orthodox Church, acknowledging as they did so that this was an ecclesiastical organization whose spiritual and administrative base was the Church of Constantinople. A ruler who had recently converted to Christianity according to the Byzantine (that is, Eastern) rite was sent priests and bishops from the Patriarchal School in Constantinople. These men proceeded to establish dioceses of the Byzantine Church in the convert country. Thus, Bulgaria, whose ruler khan Boris had been baptized as a Christian in 865, had received significant numbers of Greek priests and a Greek archbishop by 870. Likewise, when grand prince Vladimir of Kiev accepted Christianity from the Byzantines in 988, he was sent Greek-speaking priests and bishops from Constantinople to facilitate the establishment of the new Russian Church. The setting up of the Orthodox Church in 13th-century Serbia conformed to the same pattern.

12. Byzantine Commonwealth in the 11th century

Yet, the conversion of eastern Europe to Orthodoxy, rather than Catholicism, was not inevitable, for missionaries from both denominations operated there until the 10th century. The attraction of Orthodoxy lay in the fact that, whereas the western missionaries believed that the scriptures should be read only in their original, "sacred" languages, Greek and Hebrew, and also Latin, the Byzantine missionaries agreed that new converts should be able to worship in the vernacular (citing 1 Corinthians 14 as justification). Moreover, since the Slavs (who had migrated into the region in the 7th century) did not have a written script for the Slavic language, the Byzantine Church invented one for it. Two monks, Cyril and Methodios, were sent to introduce the script to the Christian communities of eastern Europe, specifically Moravia, Bulgaria, and Kievan Rus. The script, known as Old Church Slavonic (from which the modern-day Cyrillic is derived), had unprecedented success. Although Moravia was later absorbed into the Catholic Church, the other countries that accepted and used the Slavonic script remained within the orbit of the Eastern Church through the Great Schism of 1054 and beyond. The exception is Croatia, which gradually orientated itself towards the West after the 8th century. Nevertheless, when the Synod of Spalatum was convened around 1069, there were still Christians in the eastern part of Croatia who worshipped according to the Slavonic rite. The contribution of Cyril and Methodios, therefore, to the formation of the Byzantine Commonwealth is inestimable.

Political, as well as spiritual, consequences followed from accepting the liturgy of the Orthodox Church. These could not be separated from doctrinal beliefs, for Orthodoxy brought to bear upon its adherents a coherent system of thought, which encompassed the social and political realms, as well as the theological. Thus, the Byzantines conceived of the (Orthodox) eastern European countries as part of an indivisible Christian society, or *oikoumene*, over which God had appointed the emperor to be the guardian before Christ's return to earth. When a ruler (and hence his country) converted to Christianity, the imperial government held to an implicit belief that he had publicly acknowledged his subservience to the Byzantine emperor in Constantinople and had promised that in future he would help to defend the *oikoumene* against external attack. The empire's perceived hegemony was expressed diplomatically in the emperor's practice of standing as godfather to new Christian rulers, or, occasionally, by "adopting" a foreign ruler to be his "spiritual brother" or "spiritual son".

In theory, there was no room for dissent of any kind within the *oikoumene*. The Byzantines believed that dissent in one area would inevitably damage all of the Christian community. When, in the 1390s, for example, prince Basil I of Moscow

made disparaging remarks about the relationship of the emperor to the Church, he received a stern letter from the patriarch of Constantinople: "It is not possible for Christians to have the Church and not to have the empire. For Church and empire have a great unity and community; nor is it possible for them to be separated from one another." Nevertheless, the political unity of the Byzantine Commonwealth should not be overemphasized. Whereas ecclesiastical unity was maintained, albeit with local variations of emphasis, throughout the Orthodox world, the notion that a political hierarchy existed among the rulers of the commonwealth, with the emperor at its head, was often a theoretical abstraction and seldom put to practical use. The list of foreign rulers, together with their ranking and mode of address, which appears in the mid-10th-century Byzantine source *The Book of Ceremonies* does not indicate the extent to which other countries were incorporated into the Byzantine orbit.

While direct political links between the commonwealth and the empire became less defined as the period progressed, the commonwealth's cultural identity became more evident. It was common for the rulers of eastern Europe to import Byzantine master craftsmen and architects so that their palaces and cathedrals could be built in the Byzantine style. The 11th-century rebuilding of Kiev is a case in point. Meanwhile, the popularity of the Slavonic script continued to grow, and with it the demand for literary works translated from the Greek. In monasteries across eastern Europe, and particularly on Mount Athos, the international monastic centre near Thessalonica, monks laboured in scriptoria, copying or translating into Slavonic the works of Byzantine and Classical scholars. The books – containing both theological and secular works – were then sent to libraries and churches in far-reaching parts of the commonwealth.

The intermediaries for the transmission of Byzantine cultural influences were not always people moving into the commonwealth from the direction of the empire. The assimilation, for example, of Kievan Rus into the commonwealth was greatly facilitated by Russian links with the Bulgarians. The Russian ruling elite obtained its first prolonged exposure to Byzantine culture in 967 when it attacked eastern Bulgaria on behalf of emperor Nikephoros Phokas. Impressed by the wealth of urban Bulgaria, grand prince Svyatoslav of Kiev refused to leave, writing in a letter to his mother Olga that life in Bulgaria was far preferable to that in Kievan Rus. When, eventually, in 971, the Russians were persuaded to return home, they took with them a new taste for Byzantine culture, as well as Byzantine literature, and at least one Byzantine woman – who was given in marriage to Svyatoslav's son. Nearly 50 years later, Kievan Rus was again the recipient of a Byzantine culture that had been filtered through a Bulgarian intermediary. After the Byzantine annexation of Bulgaria in 1018, many Bulgarians, including priests and other educated people, migrated north to Kiev. As well as their everyday possessions, they took with them Slavic translations of Byzantine literature, including law codes. The migrant Bulgarians were assimilated into Russian society and seem to have had a significant impact on Russian literary development, for philological research has shown that many of the medieval Slavonic scripts found in Russia are of Bulgarian origin.

The facets of Byzantine political, social, and religious life that were transmitted into eastern Europe during the period 500–1453 were not unaffected by the existing culture of the recipient peoples, or these peoples' own circumstances. Nor did the "Byzantinizing" process hinder the development of a unique social and political identity in the countries of the Byzantine Commonwealth. Indeed, having possession of Byzantine ideas about governance and social organization actually helped countries such as Bulgaria to break away from the empire's overlordship and to develop their own state structures in the later Middle Ages.

It is, therefore, difficult to offer a comprehensive description of the Byzantine Commonwealth, and the precise borders of this entity have eluded identification. Those scholars who have conceived of the commonwealth as an international community composed principally of formalized political linkages – such as dynastic marriages or the granting of court titles – have often been critical of the concept of a Byzantine Commonwealth. Yet, scholars more interested in the processes of cultural transmission have found that the concept provides a useful framework for examining the international relations of eastern Europe in the medieval period. This latter group of scholars has carried out more detailed historical research on aspects of Obolensky's argument, the result of which has been the further illumination of cultural linkages between the empire and its neighbours. New archaeological research has also illuminated such linkages, and has, interestingly, strengthened the view that the "Byzantinization" process was not confined to eastern Europe and the Christian *oikoumene*, but took place in parts of central and western Europe as well. The process can even be identified outside Obolensky's chronological remit of 500–1453. If the reign of Constantine the Great is taken to mark the inauguration of the Christian (Byzantine) empire, then those aspects of religious and cultural life that sprang – directly or indirectly – from the events of his reign can reliably be termed "Byzantine", rather than "late Roman". The transmission of these aspects of Byzantine culture across formal imperial boundaries (and even as far as the westernmost parts of Europe) is reliably attested throughout the 4th and 5th centuries, albeit to differing degrees. It seems possible, therefore, that the formative years of the Byzantine Commonwealth are to be found rather earlier than was previously suggested by Obolensky, and that, moreover, the geographical area covered by it was broader than hitherto supposed. While the Byzantine Commonwealth continues to evade a precise characterization, therefore, it is likely to remain the subject of academic research.

Communist Party (KKE)

The Communist Party of Greece was founded on 10 November 1918 as the Socialist Labour Party of Greece (*Sosialistikon Ergatikon Komma Ellados*, SEKE); in April 1920 the party joined the Third International and was renamed SEKE(Kommounistiko); at its Third Extraordinary Congress in 1924 SEKE(K) changed its name to KKE (*Kommounistiko Komma Elladas – Elliniko Tmima tis Kommounistikis Diethnous*) (Communist Party of Greece – Greek Section of the Communist International).

Throughout the interwar years the KKE remained a party with marginal appeal; its share of the national vote was consistently small in the period until 1929, remaining below 4 per cent, and usually polling much less. This was partly the result of the policy of vigorous *ouvrierisme* the KKE pursued; a weakness that is hardly surprising, considering the numerical weakness of Greek industrial workers in the interwar years. The weakness was, however, attenuated by the continuous power struggles within the party: by 1931 the KKE had changed leader eight times, with the loss of leadership usually accompanied by the expulsion of the outgoing leader from the party. The party also had to overcome bouts of state measures intended to limit its effectiveness. In 1931 the Comintern sent Nikos Zahariadis to reorganize the KKE; he became its Secretary General in 1935, a post he retained until 1956. Under Zahariadis the KKE came out of its isolation, increased party membership tenfold, modified its highly unpopular position on the Macedonian Question, and even managed to elect 15 deputies in the elections of January 1936, enough to hold the balance in the hung parliament that ensued.

Under the Metaxas dictatorship, the KKE party organization was all but destroyed. Large numbers of real and suspected communists were arrested, imprisoned, or exiled, including virtually the whole of the party leadership. Maniadakis, the head of the Metaxas secret police, even created its own bogus KKE organization, complete with *Rizospastis*, the party newspaper, that sowed confusion in the ranks of the remaining communist supporters.

However, the KKE reached the peak of its popularity during the Axis occupation of Greece. It was the founding force and controlling influence in EAM and ELAS (*Ethniko Apelevtherotiko Metopo*, National Liberation Front, and *Ellinikos Laikos Apelevtherotikos Stratos*, Greek Popular Liberation Army), respectively the largest political and military resistance movements in occupied Greece. By the end of the occupation, party membership had multiplied and the KKE was claiming that its ideas and policies enjoyed the support of a very large segment of the population. The KKE (and EAM) had declared against the return of king George II to Greece after the end of the war, at least until a plebiscite had been organized; it was also initially against participation in the government of national unity formed under George Papandreou after the Lebanon Agreement in 1944. However, probably as a result of advice by a Soviet mission that was parachuted into the Greek mountains in July 1944, it suddenly reversed its position, cooperated with the British and the bourgeois parties, and accepted five relatively minor ministerial portfolios.

Following the liberation of Greece, the KKE's policy remained ambivalent. It seemed to fail to decide whether it wanted to seize power by force or not. The communist ministers resigned from the Papandreou government on 1 December 1944; what followed was the *Dekemvriana*, the events of December 1944 and January 1945, when ELAS forces fought pitched battles in Athens against British and Greek forces. The Varkiza Agreement of February 1945 ended the hostilities but not the conflict. For the next 18 months the KKE, once more under the leadership of Zahariadis (who had spent the war years in Dachau concentration camp), vacillated between participation in politics and armed struggle. The KKE controversially decided to abstain from the elections of March 1946, thus probably losing its last chance of peaceful integration in national politics. In the meantime the country was sliding towards civil war. The KKE adopted a policy of self-defence for its members, many of whom had been driven underground or to the mountains by extreme right-wing repression. By August 1946 armed bands were already formed; in October the KKE announced the formation of the Democratic Army; the KKE was declared illegal in December 1947; it was to remain illegal until 1974. In the summer of 1948, following the Tito–Cominform split, the KKE sided with Stalin, publicly condemning Tito, despite the fact that most of its supplies were coming from Yugoslavia. At about the same time, Zahariadis assumed the military leadership of the struggle and forced a change in tactics, which is usually credited (along with the massive US support for the Athens national government) with the defeat of the Communist Democratic Army in the Civil War.

Between 1949 and 1974 the KKE operated in exile, with headquarters in Bucharest and branches in other countries of the Eastern bloc. Zahariadis insisted on retaining the party on a war footing, even after it became clear that the armed struggle was no longer a realistic option. Following de-Stalinization in the Soviet Union and the satellites, Zahariadis was deposed and exiled to Siberia. Throughout the 1951–67 period, in politics in Greece itself, the KKE supported EDA (*Enomeni Dimotratiki Aristera*, United Democratic Left, founded in

1951), an umbrella of left-wing forces, which successfully contested all national elections between 1952 and 1967.

The KKE went through a major crisis in 1968, when it split into a Euro-communist faction named KKE(es) (KKE of the Interior) and the Moscow-oriented mainstream KKE. The party was legalized after the fall of the Colonels' regime in 1974; under the leadership of Harilaos Florakis, a resistance and Civil War veteran, the KKE established itself as the major party expressing the communist left in post-1974 Greece. The KKE contested all elections after 1974, either alone or in coalition with other left-wing parties; however, it never polled more than 12 per cent of the national vote: even in the elections of June 1989, when virtually all left-wing parties cooperated in an alliance, their collective share of the vote was 13.1 per cent. Between 1974 and the mid-1980s the party's influence was very considerable in the student movement, where KNE, the Communist Party youth, often dominated the scene.

While in the 1970s and early 1980s the party showing remained more or less stable, subsequently the KKE saw its fortunes gradually decline; this was in part the result of the rise and success of the more vigorous, left-of-centre Panhellenic Socialist Party (PASOK), which deprived the KKE of some support from moderate leftists.

During the period 1989–90 the KKE participated in government for the first time since 1944. Between July and November 1989 it was the junior partner in a coalition with the conservative New Democracy party; it subsequently participated in the "ecumenical" (grand coalition) government that governed between November 1989 and April 1990, as the elections of November 1989 had produced another hung parliament.

The KKE passed a serious crisis in 1989, when it supported the anti-Gorbachev coup in the Soviet Union. Though Florakis retired and there was some renewal in the leadership, more importantly the party failed to renew its policies in the 1990s, retaining an anti-Western, anti-capitalist rhetoric of diminishing relevance for the majority of the Greek electorate. This resulted in a further decrease of party support in the elections of 1993 and 1996, a decrease bringing electoral support for the KKE to roughly 1936 levels.

Constantine I 1868–1922

King of the Hellenes

Constantine I ranks among the most controversial personalities of modern Greece. He was the eldest son of king George I and Queen Olga; in 1889 he married Princess Sophie Dorothea Hohenzollern, sister of kaiser Wilhelm of Germany. He trained as a soldier both in Athens and in Germany, but his reputation received a blow when he commanded the Greek army in Thessaly in the disastrous war of in 1897. However, though the defeat may have been to an extent due to his lack of experience, it was probably more directly linked to the lack of preparedness and inadequate training of the Greek army of the time. Despite demands for his resignation, Constantine retained his army position until the 1909 Goudi pronunciamento, when the Military League demanded that he and the other princes resign from army posts. He was reinstated by Venizelos in 1911, and was commander-in-chief of the Greek army in the highly successful campaigns of the Balkan Wars of 1912–13. In 1913, in an action that would be variously interpreted later, the kaiser presented him with the baton of a field marshal of the Prussian army.

He ascended the throne in 1913, at the age of 45, following the assassination of king George I in Thessalonica. He soon proved that, though he was a charismatic leader, he lacked his father's wisdom as well as experience. Constantine enjoyed considerable popularity, especially among the army: an army deputation had acted as godfather for his youngest child, princess Katherine, earning him the affectionate nickname *koumparos* (godbrother).

Initially Constantine cooperated well with prime minister Venizelos, but this ended with the outbreak of World War I. Venizelos was in favour of entering the war on the side of the Entente, and his arguments became even weightier after both Ottoman Turkey and Bulgaria, Greece's traditional enemies, joined the Central Powers (in November 1914 and September 1915 respectively). Constantine was in favour of remaining neutral, an attitude popularly described at the time as a view in favour of a "small and honourable Greece". This was linked to the view that consolidation of the territorial gains of the Balkan Wars should be the first priority, rather than further territorial expansion, as dictated by the Great Idea. To justify his involvement in active politics, Constantine claimed foreign affairs lay within his constitutional powers; Venizelos, disagreeing, resigned in March 1915, but won a clear majority in the elections of the following June. Venizelos regarded the result as a clear mandate in favour of Greek entry to the war alongside the Entente powers, but Constantine still refused to agree to this and once more demanded his resignation; Venizelos was subsequently dismissed and fresh elections were called. This disagreement was the beginning of the national schism.

Venizelos's party abstained from the elections of December 1915; other international and national events, among them the coup staged in Thessalonica by the National Defence movement, widened the rift between Constantine and Venizelos. By 1916 Greece was on the brink of civil war, with two governments: a royal government in Athens, formally neutral, controlling the southern half of Greece; and a Venizelist

provisional government in Thessalonica, controlling the northern half and most of the islands, supporting and supported by the Entente. In June 1917 the Entente demanded that Constantine leave the country, using as pretext the violation of his oath to uphold the Greek Constitution. He left with the crown prince (later king George II), without formally abdicating, and was succeeded by his second son, Alexander. A government headed by Venizelos assumed power over the whole of Greece.

Constantine remained away from Greece (mostly in Switzerland) until Venizelos's defeat in the elections of November 1920. A rigged plebiscite, organized by the victorious Popular Party in December 1920, invited Constantine back to the throne. Once back, Constantine presided over the gradual unravelling of Greece's adventure in Asia Minor. Neither he nor the Populist government was strong or decisive enough to disentangle Greece from Asia Minor. Disaster came in August 1922, when the Turkish nationalist forces under Mustafa Kemal (later Atatürk) attacked and broke the front. The defeated Greek troops, evacuated to the nearby islands, revolted and demanded, among other things, the king's abdication. Constantine abdicated on 26 September 1922 and left Greece. He died in an obscure hotel in Palermo four months later.

As the popular support for him shows, Constantine was both charismatic and gifted; his shortcomings were mostly in that he saw the role of the monarch as much more active than the times (and the 1911 Constitution in force at the time) allowed. Indeed his involvement in politics dates from well before he became king: while still the crown prince he had been partly responsible for bringing down one of the Trikoupis administrations, when he openly participated in an anti-government demonstration. Once king, he elected to become an active political player, rather than the impassive umpire his father had been. He identified with the Populists and the more conservative elements in Greek society; his advocacy of neutrality during World War I, and the lengths to which he was prepared to go to advance it, gave him a reputation as a Germanophile, which he was never quite able to dispel. During the deepest rift of the national schism, he was even branded as a traitor, though very little evidence of direct links with the Central Powers has been uncovered.

Adoring supporters at the time called him Constantine XII, a numeral chosen to imply continuity between the modern Greek dynasty and the Byzantine emperors; and a proverb circulating at the time was claiming that as a Constantine was the last Greek emperor of Constantinople (in 1453), it would be a Constantine who would take it back from the Ottomans. Constantine got nearest to the realization of the dreams of the Great Idea, though this was more a result of Venizelos's foresight than his own policies. It is ironic that he would die in exile and remain, even after death, the object of hatred for half his people and of admiration for the other half.

GEORGE KAZAMIAS

Biography

Born in 1868 the eldest son of king George I and queen Olga, Constantine trained as a soldier in Athens and Berlin. In 1889 he married princess Sophie, sister of Kaiser Wilhelm II. He commanded the Greek forces in the Graeco-Turkish war of 1897 and in the Balkan Wars of 1912–13. He came to the throne in 1913 and clashed with Venizelos about entry into World War I. He went into exile in 1917–20. Invited back, he abdicated after the Asia Minor disaster in 1922. He died in Palermo in 1922.

Constantine I the Great 273/74–337

Emperor

Constantine the Great was born in Naissus (modern Niš, in Serbia) in 273/4, the son of the future emperor Constantius Chlorus and Helena his concubine (or perhaps wife). From 293, when his father became a member of the tetrarchy, as Caesar to the Augustus Maximian, Constantine served in the Roman army in the eastern part of the empire, first fighting in the Persian war and later serving with Galerius on the Danube; thereafter he seems to have been attached to Diocletian's court. The "Great Persecution" of the Christians began in 303, though in the west it was less severe than in the east, and in Gaul and Britain, where Constantius held sway, the persecution seems to have been limited to the demolition of churches. In 305 Diocletian, then seriously ill, and the other senior emperor, or Augustus, Maximian, resigned and were succeeded by their Caesars, Galerius and Constantius. Constantine (and Maximian's son, Maxentius) was passed over in the succession; two of Galerius' favourites, Severus (possibly his praetorian prefect) and Maximinus (his nephew), became Caesars.

After the reconstitution of the tetrarchy in Nicomedia, Constantius left for Britain, soon followed by his son. On 25 July 306, at York, Constantius died, and Constantine was immediately hailed by the army there as Augustus, his father's successor. He immediately announced his assumption of the imperial dignity to Galerius, the other Augustus, who compromised by appointing him Caesar, a position Constantine did not refuse, thus assuring beyond any doubt his legitimacy. The ensuing dissolution of the tetrarchy was a complicated business. Maxentius, initially with the support of his father, proclaimed himself Augustus in Italy. After Severus' failure to defeat Maxentius, Galerius appointed Licinius to the task, as Augustus. Galerius himself died in 311, having issued an edict of toleration, bringing to an end the persecution of Christians in the east. The following year Constantine advanced into Italy. On 28 October Maxentius left Rome and crossed the Tiber to

Constantine the Great: portrait of the emperor on a gold solidus minted at Nicodemia in 335, Barber Institute, Birmingham

confront the forces of Constantine. At the Battle of the Milvian Bridge he was defeated, and Constantine entered the city as the undisputed ruler of the western Roman empire. Rule of the eastern empire was now disputed between the two other Augusti: Maximinus, who had begun persecuting Christians again in Egypt and Palestine, and Licinius, whom Constantine supported. In 313 Constantine and Licinius met in Milan and extended to the whole empire the toleration Christians were already enjoying in the western part of the empire. Later that year Licinius defeated Maximinus. Harmony between the two Augusti, Constantine and Licinius, did not last long. There was an indecisive war in 316, and in 324 Licinius was finally defeated by Constantine, who thus became sole emperor, which he remained until his death.

Constantine's victory over Maxentius in 312 was presented in Constantine's propaganda as a victory for Christianity (though there is evidence that Maxentius supported the Christians too), and very soon there circulated stories that before the battle Constantine had had a dream (so Lactantius), or a vision in the sky (so Eusebius), in which he had seen the cross as an emblem of victory, which he was to use as his military standard: the *labarum*, bearing either the chi-rho or the *crux monogrammaticum* (so Lactantius, who says that it was inscribed on the shields of Constantine's soldiers). This dream or vision is presented as Constantine's conversion. There is in fact evidence that Constantine was far from unfamiliar with Christianity: the name of one of his half-sisters, Anastasia, may indicate longstanding Christian leanings in his family, and Constantine seems to have included Christian bishops in his entourage before the victory of 312. It is, however, clear that after 312 Constantine adopted Christianity as his favoured religion and made it the object of his considerable patronage. There is also evidence from coinage that like his father he maintained his devotion to *sol invictus*, the "unconquered sun", but it is not unlikely that, like later Roman Christians we hear of from pope Leo I (440–61), he had no problem in assimilating Christ and the *sol invictus*. As to the motives for his conversion, there is continuing scholarly dispute over whether it was a response to the growing Christianization of the empire, or a precondition for its ensuing Christianization. The pagan rumour (preserved by Zosimus) that Constantine embraced Christianity as the only religion that could offer forgiveness to one who had murdered his wife and son in 326 is perhaps not entirely without foundation. At any rate, Constantine only became a baptized Christian on his deathbed in 337.

Constantine's support for Christianity is manifest in his providing funds for the building of churches, initially in the west, but soon in the east, and also in the introduction of changes in the law to meet Christian sensibilities (for instance recognizing bishops as legitimate legal arbiters). It is perhaps also manifest in his founding in 330 the city of Constantinople, named after him, or "New Rome". However, Eusebius' account of Constantine's planning a Christian city with many churches is not borne out by the surviving evidence: it seems that the only church begun by Constantine was the church of the Holy Apostles, intended as his mausoleum where his body would rest as that of the 13th apostle. The Christian Church, the object of Constantine's favours, very soon presented problems for him. In north Africa he found a Church divided by Donatism, and quickly discovered that Christian disunity was not easily dealt with. Even worse, when he had attained his ambition as sole emperor in 324, he found the Church in the east divided over the issue of Arianism. To solve this he convoked a synod, the first Council of Nicaea, which within a decade or so was to be regarded as the first ecumenical (or universal) council: Arius was condemned and the Christian faith defined in a creed (or symbol) drawn by the council. Constantine's involvement in the affairs of the Church has often been seen as the beginnings of Caesaropapism, though it has recently been forcefully argued (by Barnes) that Constantine and his immediate successors were scrupulous in respecting the government of the Church by bishops meeting in synod. Despite the clear decision of the Council of Nicaea against Arianism, Constantine seemed to compromise in his later years (at least in the eyes of the Orthodox) and received baptism from the hands of an Arian bishop, Eusebius of Nicomedia.

Constantine's reputation as the first Christian emperor was enormous: more of his successors bore the name of Constantine than any other, the last dying in defence of the city Constantine had founded in 1453. The vision of the cross that was the occasion of his conversion led to its becoming a symbol closely associated with Constantine (and the imperial office), which was enhanced in legend by his being closely associated with his mother Helena's discovery of the True Cross in 326. The shadow cast over his name by his having been baptized on his deathbed by an Arian was removed by the legend that he was baptized in Rome after his victory at the Milvian Bridge by pope Sylvester I. He is commemorated as a saint in the Orthodox Church, together with his mother Helena, on 21 May.

Constantine V 718–775

Emperor

Constantine V (741–75) earned unparalleled notoriety with Byzantine commentators due to his violent persecution of the supporters of icons during the first part of the iconoclastic controversy (726/30–784). The opprobrious nicknames given him included *Kopronymos* (the "dung-named", referring to a story that he had excreted in the font during baptism, an exceptionally bad omen) and *Kaballinos* (or "stable hand", a reference to his penchant for horses). In his day, however, he enjoyed a power base of military and to an extent political support that few other emperors before or after him could boast.

Constantine was the son and successor of the emperor Leo III the Isaurian (716–41) who initiated official iconoclast policies in either 726 or 730. The initial reaction to this policy appears to have been muted, thanks to popular approval of Leo's decisive actions in 717 when he helped to save Constantinople from a prolonged Arab siege. But it does not seem that he waged an all-out campaign of destruction against either icons or their supporters. All he asked for was an end to the actual veneration of icons, especially in public places and churches.

After Leo III's death in 741, Constantine appears to have enjoyed considerable support in the provincial, or *thematic*, armies, thanks to his father's victories against both Bulgars and Arabs, the like of which had rarely been seen since Herakleios's last campaigns against the Persians a century earlier. But the outset of Constantine's reign was marked by the revolt of his brother-in-law Artabasdos (*c.*741–43) who even managed to occupy Constantinople in 743, where he may have reversed iconoclast policies. Constantine finally crushed the revolt but the incident had impressed upon him the need to restructure the military and tie them more closely to his person.

The most important feature of Constantine's military reforms, beginning in the mid-740s, involved the creation of well-trained and well-maintained garrison units and field armies in and around Constantinople: these were collectively known as the *tagmata* (singular *tagma*, i.e. battalion) and were mostly recruited from the civic deme factions of the capital and destitute members of the mob. The crack troops of the *tagmata* eventually constituted Constantine's power base for his violent execution of iconoclast policies. The emperor's military prowess, his attention to the welfare of his troops, and his triumphs against the Bulgars (at Anchialos in 763 and Lithosoria in 773) and the Arabs (the capture of Germanikeia, Theodosioupolis, and Melitine in 752) associated his success with his iconoclasm in the military and popular mind. Consequently, anyone who opposed iconoclasm came to be identified as a personal enemy of the emperor and a traitor to the state.

The devastating plague of 746–47, during which Constantine may have briefly moved his court to Nicomedia, may have convinced him that God wanted him to take a tougher line against the icons and their venerators, the most vocal of whom were monks. After all, God had not failed him before. Furthermore, Constantine began to realize that, in order to refute the icons once and for all, theological arguments had to be presented at a Church council. This led to the Council of Hieria in 754 which, although proclaiming itself ecumenical, included no representatives from Rome or the eastern patriarchates, and even lacked a patriarch of Constantinople up to the very last session.

Constantine displayed prowess in his theological writings, of which the so-called *Peuseis*, or "Questions", is the only surviving example – if indeed there were originally others. Some historians have detected a Monophysite strain in his theology, claiming that his family's origins in north Syria predisposed him to such inclinations. This need not necessarily be the case. Nevertheless, Constantine may have influenced the synod's final pronouncements. Two of the most important points made in the *Peuseis* are that to portray Christ in an icon necessarily circumscribes the uncircumscribable divine nature in Him, and that the only true image (*typos*) of Christ was the Eucharist itself.

Imperial persecution of iconophiles (venerators of icons), mostly monks and nuns, increased around this time. Some, like St Stephanos the Neomartyr, were even publicly humiliated and executed. Later Byzantine sources claim that Constantine also waged an all-out war on holy objects (gospel books, chalices, vestments, etc.) in an attempt to eliminate monastic influence entirely. Some hostility towards the Virgin Mary is also noted, although this does not seem to have characterized the line taken by the official Church. These images of gross sacrilege deeply affected later historians and churchmen and more than anything contributed to the notoriety of both emperor and iconoclasm in their writings. These actions, however, were not part of any calculated iconoclast attack against the holy. Social and political factors (psychological dislocation in the wake of the plague, the hero cult around Constantine, short-term localized power interests, etc.) can help to explain them better.

Iconoclasm apart, Constantine showed a great interest in secular art, decorating his residences with scenes of his battles and his favourite charioteers. He also may have been responsible for the renovation of the church of Hagia Irene in

Constantinople, one of the most significant monuments of the period.

In his policy with the Caliphate he showed prowess, stemming Arab advances with a determination never previously seen. His iconoclast policies, however, isolated him in the iconophile West, and he may have been responsible for removing Calabria, Sicily, Illyricum, Macedonia, Crete, and Greece from the nominal jurisdiction of Rome and placing them under Constantinople. His hostile policies led to Rome drawing closer to the Franks in their struggle against the Lombards, and have long been regarded as contributing indirectly to the rise of Charlemagne.

Together with his father, Constantine may have been responsible for the publication in 741 of the *Ekloge*, the famous law code in which Christian attitudes to laws relating to the family, sexual offences, and criminal law begin to predominate over the more legalistic compilations of the Roman past. The *Ekloge* had a great influence on Byzantine law for centuries.

Constantine's war against the iconophiles subsided after his death in 775, indicating that its ferocity had much to do with his own personality. By 787, during the regency of his daughter-in-law Irene, the icons had been restored at the second Council of Nicaea and militant iconoclasm had abated.

Constantine's shadow loomed large over the events leading to the second period of iconoclasm, when soldiers and the mob invoked his name during a disastrous war with the Bulgars undertaken by iconophile emperors (809–16). The second period of iconoclasm, begun by Leo V in 815, owed much to his memory. The patriarch Nikephoros (806–15) attempted in his writings to refute the idea that Constantine's reign had been a "golden age". After 843 his name became synonymous with the powers of evil, and his bones were exhumed from the church of the Holy Apostles in Constantinople and discarded.

In modern Byzantine studies Constantine represents an anomaly that has fascinated historians, some of whom have regarded him as an enlightened despot trying to centralize the secular power of the state in the face of a "reactionary" iconophile Church. Protestant theologians see his iconoclasm as a precursor of the Reformation. Such evaluations, however, have more to do with modern concepts of progress and religion than with a realistic appraisal of events.

Biography

Born at Constantinople in 718, Constantine succeeded his father Leo III in 741. Surviving a revolt by his brother-in-law Artabasdos in 741–43, he reorganized the military. In 754 he convened a church council at Hieria and thereafter pursued iconoclast policies which he supported with his own writings. He died at Strongylon in 775. After the triumph of Orthodoxy in 843 his bones were exhumed and scattered.

Constantine VII 905–959

Emperor

The name of Constantine VII, or Constantine Porphyrogennetos (913–59), is one inextricably linked with the so-called encyclopaedic trend of 9th- and 10th-century Byzantine literature, epitomized by such works as the *Book of Themes* (*De Thematibus*), the *Book of Ceremonies* (*De Ceremoniis*), and *On Governing the Empire* (*De Administrando Imperio*), all works commissioned, if not personally compiled, by Constantine VII. This literary role that characterizes Constantine is often ascribed to his exclusion from imperial power for so long.

Although born the son of the emperor Leo VI in 905 and crowned co-emperor in 908, Constantine VII had to wait from 912 (the date of the death of his father) until 945 to be an independent emperor. His uncle Alexander ruled from 912–913, then a regency was established for Constantine headed by the patriarch Nicholas. Constantine's mother Zoe Karbonopsina managed to oust Nicholas in 914 and establish herself as regent, but in 919 the admiral Romanos Lekapenos forced her to retire and gained control of Constantine. Constantine was married to Romanos's daughter Helena, then Romanos became emperor himself in 920, maintaining Constantine as a co-emperor but also establishing his own sons as co-emperors. Romanos I ruled until 944 when he was dethroned by his sons Stephen and Constantine. However they soon fell themselves in 945, and Constantine VII finally secured his birthright. Thus it was to fill his time during his exclusion from power that he turned to intellectual pursuits. Some sources also credit him with being a painter.

Perhaps the most famous of the encyclopaedic works linked with Constantine VII is the *Book of Ceremonies*. It was divided into two books, the second asserting that it was innovative because it drew on material that had previously been known only orally, though it too does contain pre-existing material,

such as Philotheos's *Kletorologion* (a list of titles and offices), which was produced under Leo VI in 899. More significant perhaps are the ideas expressed in the prefaces – the importance of ceremony for *taxis* (order), the reproduction on earth of the harmony of the universe created by the Divinity. Here, as in other texts, Constantine's work is characterized by the qualities of compiling, cutting and pasting, preserving, and preface-adding.

The *On Governing the Empire* seems to be "a sort of encyclopedia of Byzantium's foreign policy" (Lemerle, p.320). It is prefaced by an address from Constantine VII to his son Romanos, asserting that the text is to be his guide to ruling over foreign nations well. The work consists of 53 chapters and is preoccupied especially with the Pechenegs (but seems hopelessly outdated on the Arabs and the West), and it also turns to internal diplomacy in its latter chapters. Here we find an emphasis (as in other texts connected with Constantine) on the language in which it is written – an everyday, understandable style.

The *Book of Themes* is a more problematic work. There is no address to Romanos, indeed no preface at all. It is divided into two books, one on the eastern themes, one on the western, and again its information seems less than up-to-date.

Of the other encyclopaedic works linked with Constantine, but not in his name, the most famous is probably the *Excerpta*. This was in 53 sections, each dealing with a particular topic, and each consisting of extracts drawn from pre-existing material, especially Hellenistic, Roman, and Byzantine histories, rather than the Greek classics of Herodotus, Thucydides, and Xenophon. In fact, the 26 authors known from the surviving list are notable for the reason that "almost half of them [are] grouped around the fifth to seventh centuries" (Lemerle, p.331). Each section was also topped by a preface, which appears to have been identical for each. Of this vast work only a tiny part has survived, notably Section 27 "On Embassies" and Section 50 "On Virtues and Vices". Lemerle remarks that "The scale of the tenth-century collection, as also the size of our loss, is astonishing" (p.325).

A well-known work in the encyclopaedic tradition dedicated to Constantine is the *Geoponica*, on rural life. It is divided into 20 sections, is headed by a preface, lists the authors consulted, and appears merely to use a pre-existing text (that of Kassianos Bassos Scholastikos).

Constantine seems also to have been the inspiration behind a corpus of strategic writings, including the *Taktika* of his father; and he appears to be the dedicatee of the famous *Synaxarion of Constantinople*. Thus the literary activity of his reign connected with him is broad and all-encompassing, pointing perhaps to a desire to possess all manner of human wisdom, casting the emperor in the role of the Old Testament king Solomon; indeed the preface to *On Governing the Empire* is marked by its use of the biblical Wisdom literature.

But it is not just encyclopaedism and the amassing and arranging of information that distinguish the work connected with Constantine VII. As a member of a dynasty that had come to power through bloody murder Constantine was not blind to the need to appropriate history. The works of Genesios and Theophanes Continuatus (so-called) were the result. A biographical impulse marks these texts, making them distinct from the chronographic concerns of Theophanes. Genesios's

Constantine VII: portrait of the emperor on a gold solidus minted in 945, Barber Institute, Birmingham

work covered the reigns of the four emperors Leo V, Michael II, Theophilos, and Michael III, the last also including material on Basil I the Macedonian. Theophanes Continuatus also wrote an account based on the reigns of emperors from Leo V onwards. Books 1–5 are divided into individual reigns, but then book 6 comprises the remaining reigns together, and probably postdates Constantine VII's life. Jenkins argues that here we have the beginnings of a less black-and-white, typically medieval characterization, inspired by the use of Classical authors such as Plutarch. This latter chronicle is also distinguished by its hostile account of the reign of Michael III, but especially by book 5, composed in a different style and genre. It is a life of Basil I the Macedonian based on the rhetorical principles of the *basilikos logos* (imperial encomium – and as such owes much to Leo VI's own *Epitaphios* on his parents), and, argues Jenkins (1954), inspired by the panegyrical *Life* of Augustus by Nicholas of Damascus. This section of the work has often been attributed to Constantine VII himself, though, as Ševčenko has pointed out, the title indicates that, although Constantine amassed the material, an unknown author was entrusted with the task of writing the *Life*.

Other works are also linked with Constantine. It is thought that he began the scholia on recent legislation, and that he encouraged the reappearance of medical treatises and veterinary science. Various works with religious themes have been linked with him, characterized by their commemoration of the translation of relics. Two exhortations to the army also exist in Constantine's name.

The sheer bulk and breadth of all this material can often blind one, but Ševčenko does not dodge the question of Constantine's own abilities. Pointing to a letter of Constantine to Theodore of Cyzicus as the only true example of the writing and literary ability of the emperor, Ševčenko doubts that Constantine wrote any of the texts associated with his name, and nominates ghostwriters. It is clear that texts could appear to be written by Constantine, with his name attached to them;

he became symbolic of the trend, if not the instigator behind it, which indeed had already begun in the 9th century. Further, it is important that the issues of Constantine's personal role or the quality of the product should not obscure the significance of the ideological impulse behind these texts. The desire to preserve and harness past knowledge for presentday use is very telling for the specific mood of Byzantium in the 9th and 10th centuries, and marks a stage in Byzantium's recovery of the past before its own flourishing in the 11th and 12th centuries.

SHAUN TOUGHER

Biography

Born in 905 and crowned co-emperor in 908, Constantine did not succeed as emperor until 945. A palace-based emperor like his father Leo VI, he contributed most to the systematization of knowledge and supported the compilation of (if he did not personally compile) such works as the *Book of Themes*, the *Book of Ceremonies*, and *On Governing the Empire*. He died at Constantinople in 959.

Constantine IX Monomachos *c.*1000–1055

Emperor

Born into a noble family around 1000, Constantine IX Monomachos (1042–55) was a prominent figure at court during the reign of Romanos III Argyros (1028–34), but he was exiled to Mytilene by Michael IV (1034–41) as being politically suspect. After public loyalty to the Macedonian dynasty had forced Michael V from the throne in 1042, and the subsequent joint rule of Constantine VIII's elderly and mutually antagonistic daughters Zoe and Theodora had rapidly proved a complete failure, Zoe in the same year recalled Constantine Monomachos to become her third imperial husband. Because she was well beyond childbearing age, and probably 22 years her husband's senior, she made no objection to the recall also of his mistress Maria Skleraina (the niece of his late second wife who had shared his exile) nor to the increasingly public role and elevated status as *Sebaste* (Augusta) that he gave her at court ceremonies. Skleraina died probably in 1044 (her position passing, after a series of paramours, to an Alan princess) and Zoe in 1050, while Constantine survived until 1055, when he was buried next to Skleraina in his church of St George of Mangana and was succeeded by his now very ancient sister-in-law Theodora.

During Constantine's reign both the strength of the army and the safety of the empire, which had been built up very successfully, especially by Basil II, were severely weakened. The army suffered from a series of revolts, most notably that of its leading general George Maniakes, when Constantine, at the very outset of his reign, had foolishly recalled him from southern Italy, siding with Maniakes's rival Romanos Skleros, a relation of his mistress. In 1047 he had to put down another, equally serious rebellion from his second cousin Leo Tornikios. His disbanding of certain *thematic* border armies was dictated not only by their often inadequate performance and his need for financial retrenchment, but also by a radical change of policy. Whereas Basil II had established well-defined frontiers defended by military strength, Constantine attempted, as had so often been done successfully in the past, to create more flexible frontiers by cultivating friendly relations with neighbouring states. To this end he initiated or strengthened alliances with the papacy, the German emperor Henry III, Serbia, and Hungary, while he made conciliatory gestures to the Seljuk Turks and even sent a large quantity of corn to help relieve a famine of their rivals, the Fatimids of Egypt.

Constantine's main military achievement was the destruction in 1043 by Greek fire of a major naval force of the Rus in the Bosporus, an interruption of the generally peaceful relations between Byzantium and the Rus that probably marks the latter's growing assertion of independence. This seems to have been acknowledged by Constantine in his willingness to pay reparations for damage and injuries suffered by the Rus during the war, in betrothing in 1046 a close relative (probably his daughter Maria to Vselevod, younger son of Yaroslav the Wise, and in permitting Yaroslav to appoint the first Russian- (rather than Byzantine-)born metropolitan in 1051. However, the effectiveness of the Kievan Rus as allies once more of Byzantium was reduced by the creation of a barrier between them when, by a series of miscalculations and military failures,

Constantine was forced to accept the settlement of Pechenegs south of the Danube. In the east the seemingly promising annexation of Ani in 1045, which had been willed to Byzantium by John-Smbat III but claimed by his nephew Gagik, removed a buffer between Byzantium and the Seljuk Turks who, after the latter's capture of Baghdad in 1055, confronted each other from the Caucasus to Syria. In the west Maniakes' gains in eastern Sicily were soon lost to the Arabs after his recall, and the Byzantine hold on southern Italy was increasingly threatened by the Normans.

The iron fist of Basil II had restrained the fissiparous elements in the state. Constantine, a member of the civil aristocracy, attempted to do the same by balancing their powers. In this he was aided by a group of youngish intellectuals who included Constantine Leichoudes, John Xiphilinos (both later patriarchs), John Mauropous, and Michael Psellos. Constantine lessened the strength of the urban aristocracy by creating new senators from a broad spectrum of society. He curbed the military aristocracy by creating a new judicial ministry (*epi ton kriseon*) to coordinate provincial administration by putting the *thematic* judges under its supervision, thus ensuring their complete independence from the military governors. At the same time he attempted to improve the paltry legal knowledge of the judges (Psellos had been appointed a *thematic* judge before he was 20 without any formal training) by establishing a law school in 1047 with Xiphilinos as its head (*nomophylax*, "guardian of the laws"); his duties included not only teaching but also supervising the examination of lawyers. Shortly afterwards Constantine established a parallel position for Psellos to teach rhetoric and philosophy and supervise the capital's schools. Partly out of piety and partly also to encourage another balancing force, Constantine lavishly patronized the Church. The most notable instance of this was his building of the monastery of St George Tropaiophoros, for which he prescribed the Typikon, in the region of Mangana on the eastern slope of the acropolis of the capital, but he also made a huge donation to Hagia Sophia, and helped lavishly in the restoration of the church of the Holy Sepulchre in Jerusalem, while there still survives today the monastery of Nea Moni on Chios with the magnificent mosaics of its *katholikon* (main church).

Despite his efforts Constantine lost support for his policies and his counsellors slipped away or were forced out. A year before his death the emperor effectively lost his ability to govern when he was worsted in a power struggle with his patriarch Michael I Keroularios. Constantine was negotiating for a papal alliance to curb Norman infiltration into southern Italy, but his patriarch was feuding with the papacy over its use of unleavened bread (*azymes*) in the Eucharist. In July 1054 (the very year in which the emperor began an annual donation to the Benedictine mother-house at Monte Cassino) the papal legate Humbert and the patriarch excommunicated each other, and Keroularios's affectation of purple imperial buskins now symbolized his victory over Constantine as well as an effective end to any surviving notion of a single Church. The emperor's loss of popular support was due both to a worsening military situation with the Pechenegs and to growing economic difficulties. Tactical indulgence of the expensive pious whims of the imperial sisters, his own tax exemptions and lavish donations to monasteries, his selling of salary-bearing titular offices at ludicrously low prices, or even the granting of them as gifts, his cash payments to demobilized soldiers, the subsequent necessity of paying mercenaries, and above all the expense of the wars against the Pechenegs were all serious drains on the imperial treasury. The inevitable result was the first major devaluation of the Byzantine *nomisma* (gold coin) from a nominal 24 carats to 18, since its introduction in 309, nearly 750 years before: the days of the *nomisma* as the respected international currency were over.

Constantine was Psellos's favourite emperor, but even he criticizes him for his indolence, extravagance, and sexual laxity. Later Byzantine historians (e.g. Zonaras, *Epitomae Historiarum*, 17. 16–21, edited by M. Pindar, vol. 3, Bonn, 1897) attribute most of the empire's woes to his frivolity, generosity, subservience to womenfolk, and above all his disbanding of frontier armies. Most modern historians follow suit. However, in the early period of his reign Constantine showed that he could be assertive, and his indolence was at least in part due to a muscular disease that left him in great and constant pain in his later years. Even then, Psellos relates how he would take his part in processions and, supported on his horse by attendants, conceal his agony by means of his facial expression and demeanour in order to carry out his public responsibilities. He was affable, kind, a patron of the arts, a builder (e.g. of the complex at Mangana, which included a hospital and a palace in addition to the church of St George), and an ardent if somewhat impatient landscape gardener. Above all, his military, diplomatic, and political actions were (as Angold points out) the direct result of carefully thought-out policies aimed at a genuine *renovatio* of the Roman empire: not all were obviously misguided without the benefit of hindsight. He thus contrasts favourably with his immediate predecessors and most of his successors who merely reacted to events.

Constantine's portrait may be seen in a mosaic in the south gallery of Hagia Sophia, Constantinople, showing Christ, Zoe, and Constantine (head only; the body was originally that of Zoe's first husband, Romanos III); in the frontispiece (together with Zoe and Theodora) of a copy of the homilies of St John Chrysostom (Sinai gr. 364, fol. 3r); on an enamel plaque now in Budapest from a crown believed to have been given to Andrew I of Hungary or his wife as an instrument of diplomacy; and probably in the features of the mural of king Solomon on the south wall of the *katholikon* of Nea Moni.

A.R. LITTLEWOOD

Biography

Born *c.*1000 to a noble family, Constantine was exiled to Mytilene by Michael IV. Recalled to marry Zoe as her third husband in 1042 and crowned the next day, Constantine curbed the power of the urban and military aristocracy and patronized the Church and the arts. Despite a notable victory over the Rus in the Bosporus in 1043, both the army and the empire were weakened during his reign. He died at Constantinople in 1055.

Constantine XI Palaiologos 1405–1453

Emperor

Constantine was the fourth of the surviving six sons of the emperor Manuel II Palaiologos (1391–1425). His mother was the Serbian princess Helena Dragaš, and he alone among her sons took the name of Dragases as well as Palaiologos.

As a dynastic younger son he bore the title of despot (*despotes*). Although such younger sons were also normally given territorial appanages, during his father's lifetime Constantine never received any youthful assignment comparable to those of his elder brothers, Theodore (the Morea) and Andronikos (Thessalonica). Instead, he grew up in the capital, where he became particularly close to his eldest brother, the heir and successor to the throne, John VIII (1425–48). During their father's incapacity in his last two years, Constantine became his brother's trusted deputy. Thus, when John travelled to Venice and Hungary to plead for western aid, the 18-year-old Constantine served as his regent (1423–24), and it was he who signed a treaty (February 1424) that ended the recent outbreak of hostilities with the Turkish sultan Murad II.

The discontent of their brother Theodore prompted John to designate Constantine as his replacement, but Theodore, who was contemplating retiring to a monastery, suddenly changed his mind. Instead, after the death of their father (July 1425) and the formal accession of his brother, Constantine was given a small appanage of coastal territory around the capital extending from the Black Sea to the Sea of Marmora. But by 1427 he was transferred after all into the volatile sphere of the Morea, the one region in which Byzantium's arms were successful (against remnants of Latin rule in the Peloponnese) and its culture was flourishing. In concert with his brothers, Constantine participated in the seizures of Glarentza (1427) and Patras (1429–30) from their Latin lords. In the process, he acquired a Latin bride, Maddalena Tocco, as his first (if short-lived) wife. His youngest brother Thomas, by inheriting in 1432 the lands of his own Latin father-in-law, completed the Byzantine recovery of virtually the entire Peloponnese. Thereafter, Theodore, Constantine, and Thomas shared the rule of this region in an unstable division, which nearly dissolved into fighting in 1435 as a result of jealousies between the first two brothers.

In 1437 Constantine was summoned back to Constantinople as the emperor's most trusted deputy. While John VIII was in Italy (1437–40) attending the Council of Ferrara-Florence in order to negotiate Church union, Constantine served ably as his regent. After his brother's return, he contracted a second (and again short-lived) Latin marriage, to Caterina Gattilusio of the ruling family of Lesbos. He returned to the Morea in 1441, but was recalled to Constantinople the following year to help John resist an attempted coup by the most unstable and untrustworthy of their brothers, Demetrios. In the aftermath, newly shuffled assignments allowed Theodore – jealous of Constantine and anxious to be closer to the capital – to take up the Marmora appanage, while Constantine assumed control of the Byzantine Morea.

In 1443, therefore, Constantine took up his post in Mistra, sharing the Peloponnese with Thomas, who was ensconced in his Latin legacy in the northern regions. In the face of both internal and external difficulties, Constantine did his best to keep his territories secure from the Turks, though not always with success, while presiding over the one Byzantine region where cultural vitality and a new stirring of proud Hellenism were in full cry. Meanwhile, disillusioned by the stalemate of Church union and by the failure of hoped-for western aid, worn down in spirit and body, the emperor John died in October 1448. Ironically, his eldest brother, Theodore, who was awaiting the event nearby, himself died four months earlier, in June. Agitations in the capital on behalf of the irresponsible Demetrios were kept in control by their mother, the respected dowager empress Helena, thus clearing the path for the successor whom John himself had preferred. When the news of John's death reached Mistra, Constantine was secure in his rights. Nevertheless, he had himself crowned emperor at Mistra on 6 January 1449, before proceeding to the capital, deliberately avoiding the traditional rite of proper coronation in Hagia Sophia that would have involved his taking a stand on the divisive issue of union with Rome.

Accepted as the new – and, to be the last – Byzantine emperor, Constantine faced the suspicions of the increasingly outspoken opponents of union by pursuing mediation and postponing any commitment to it, allowing its formal proclamation only at the eleventh hour, in December 1452. His immediate task was to find allies and aid among Christian powers both eastern and western, which involved much busy but largely futile diplomacy. The urgency increased with the accession in 1451 of the new Turkish sultan, Mehmet II, whose determination to achieve the long-anticipated conquest of Constantinople soon became evident.

With ludicrously outnumbered forces and only token help from western Christian powers, Constantine prepared for the Turkish onslaught, which began on 6 April 1453. For more than seven weeks the attackers battered at the walls, which the defenders manned with stubborn courage. Constantine resisted all temptations to make terms or seek his own advantage and did his best to keep the disparate elements of Byzantines and Latins, of pro- and anti-unionists, reasonably united. When the final assault broke through on the morning of 29 May, Constantine flung himself into the last fighting and died as a common soldier.

For all our sources on the fall of Constantinople, there is no indisputable account of Constantine's death. Stories vary as to whether or not his body was ever found and, if so, what became of it. Almost immediately, however, tales began to

circulate about his fate, embellished over the ensuing centuries: reports of a secret tomb, of his preserved possessions (especially a sword), and of his sleeping until a miraculous day of awakening to reclaim his realm. Both during and after the Tourkokratia, he became a symbol to be conjured with by Greek leaders who sought to revive Hellenic sovereignty and avenge the Turkish conquest.

Constantine's melodramatic death as the martyr of expiring Byzantium has inevitably coloured any objective assessment of his character. With no reliable image of him surviving, we do not even know what he looked like. His friend and retainer, the historian Sphrantzes, praised him liberally, and less biased observers seem to have found him an honourable man, a brave soldier, and a dutiful leader, perhaps not very sophisticated, but pragmatic and earnest. His personal feelings about Church union are unknown, but he seems to have viewed the matter in practical terms, with little concern for theological partisanship, if with presumed Orthodox loyalty. Although he was a genealogical mix of Greek, Serbian, and Italian strains, his ethnic sensibilities would probably be different from our own, and he would have regarded himself as a "Roman" (*rhomaios*). He has inevitably become, however, a symbol for latterday Greek national pride and mythology, a paragon of Hellenic heroism – as witness the fanciful statue of him, of which copies today stand in a square in the new town of Mistra and before the metropolitan cathedral of Athens.

JOHN W. BARKER

Biography

Born in Constantinople in 1405, the fourth son of the emperor Manuel II, Constantine grew up in the capital and deputized for his brother, the future emperor John VIII. In 1427 he moved to the Peloponnese which he ruled jointly at first with his two brothers Theodore and Thomas and after 1443 with Thomas alone. In 1448 John VIII died, predeceased by Theodore, leaving the throne to Constantine. He was the last Byzantine emperor and died fighting as the city fell to the Ottomans on 29 May 1453.

Constantinople

The city of Byzantion or Byzantium, later called Constantinople and then Istanbul, was founded on a peninsula immediately south of the Golden Horn on the European side of Bosporus. Although this peninsula is bisected by the river Lycus, it is not well provided with water supplies. However, the narrow straits upon which the city was located were, and remain, an important trade route and enable control of sea traffic between the Aegean and the Black Sea.

Nearly a millennium after its founding in the 7th century BC (see the article on Byzantium), the city rose to new prominence in the early 4th century AD. In AD 326 – after considering several alternatives – the emperor Constantine I ("the Great") chose Byzantium as a new capital for the Roman empire. The city was then rapidly developed on a scale befitting a Roman capital, and once again new walls (the Constantinian walls) enclosed a much larger area. The city also now encompassed an area across the Golden Horn opposite the old Byzantium, Galata. This new city, formally established in AD 330, was the "New Rome" or "Constantinople" – the city of Constantine.

During the 4th and 5th centuries Constantinople continued to grow in size, and walls enclosing a much larger area were erected under Theodosius II in the 5th century (the Theodosian walls). These rendered the city virtually impregnable to land attack, and remained the principal defences throughout the Byzantine period.

Byzantine Constantinople reached a height of prosperity and sophistication between the reigns of Anastasius and Justinian I in the late 5th and 6th centuries. This phase of the city's development may serve to give an impression of its Byzantine topography, although of course the city was continually changing. Even within Justinian I's reign large areas of the city centre had to be rebuilt following the Nike riots in 532.

The principal imperial residence in late 5th- and early 6th-century Constantinople was the Great Palace. This was a sprawling complex of courtyards, halls, pavilions, and gardens, occupying much of the southeast of the city. Immediately to its north stood Hagia Sophia, the cathedral, with the palace of the patriarch (the head of the Byzantine Orthodox Church) adjacent. To the southwest of the Great Palace was the public chariot-racing arena known as the Hippodrome, and to the north of Hagia Sophia stood the city's original cathedral, Hagia Eirene. The Augusteum, a paved

Constantinople: the Golden Gate and Seven Towers Gate on the walls of Theodosius, the principal landward defences of the city

square, stood between the main entrance of the Hippodrome and Hagia Sophia, with the Senate House on its east, adjacent to the Great Palace. From a monumental milestone (the Milion) in this square, the city's main street (the Mese) ran westward through a series of four large paved fora, on the Roman model. The Mese was lined by porticos, and the fora were surrounded by porticos and adorned with monumental columns (notably the columns of Constantine and Arcadius), elaborate entrances, and statues.

As it approached the Constantinian walls, the Mese divided into a Y-shape, with branches heading for the northwest and southwest of the Theodosian walls. The northerly branch passed by the cruciform church of the Holy Apostles, the second most important church in the city and the burial place of the early Byzantine emperors, including both Constantine the Great and Justinian I. The branch to the southwest may have divided again in a Y-shape, to pass through the Second Military Gate in the Theodosian wall, and through the Golden Gate, the city's ceremonial entrance.

Outside the Theodosian walls, in addition to numerous suburbs, rural palaces, and monasteries, were the long aqueducts which fed the city's water supply. In the city, water was stored in both open and underground cisterns, of which the most famous is the underground Basilica Cistern (Yerebatan Saray) close to the Augusteum. Three large open cisterns – those of St Mocius, Aspar, and Aetius – were situated between the Theodosian and Constantinian walls. Another defensive wall (the Long Walls) enclosed the city's immediate hinterland.

Early Byzantine Constantinople contained numerous churches (some of which survive as buildings today, such as Sts Sergius and Bacchus) and monasteries, such as that of St John Stoudios, whose church is the oldest standing Christian religious building in the city. There were also the public buildings which one would expect of a major Roman city in the long-urbanized east Roman provinces, such as the baths of Zeuxippus near the Hippodrome, and Christian charitable institutions, such as the hospital of St Samson adjacent to Hagia Eirene. In addition to the Great Palace, there were other imperial palaces in the city, notably that at the Blachernae in the extreme northwest by the Theodosian walls.

There were also palatial houses belonging to aristocrats. Some were as grand as the most elaborate Roman villas of the 4th century AD, as is shown by the excavated buildings usually identified as the palace of Antiochus and Lausos close to the Hippodrome. Aristocrats also endowed churches and monasteries: the most lavish known example being the excavated church of St Polyeuktos (Saraçhane). Thus, while Constantinople was a major population centre – with perhaps half a million inhabitants in the early 6th century – and a trading port, its urban topography must have been dominated by public buildings, churches, monasteries, and palaces, at least within the Constantinian walls.

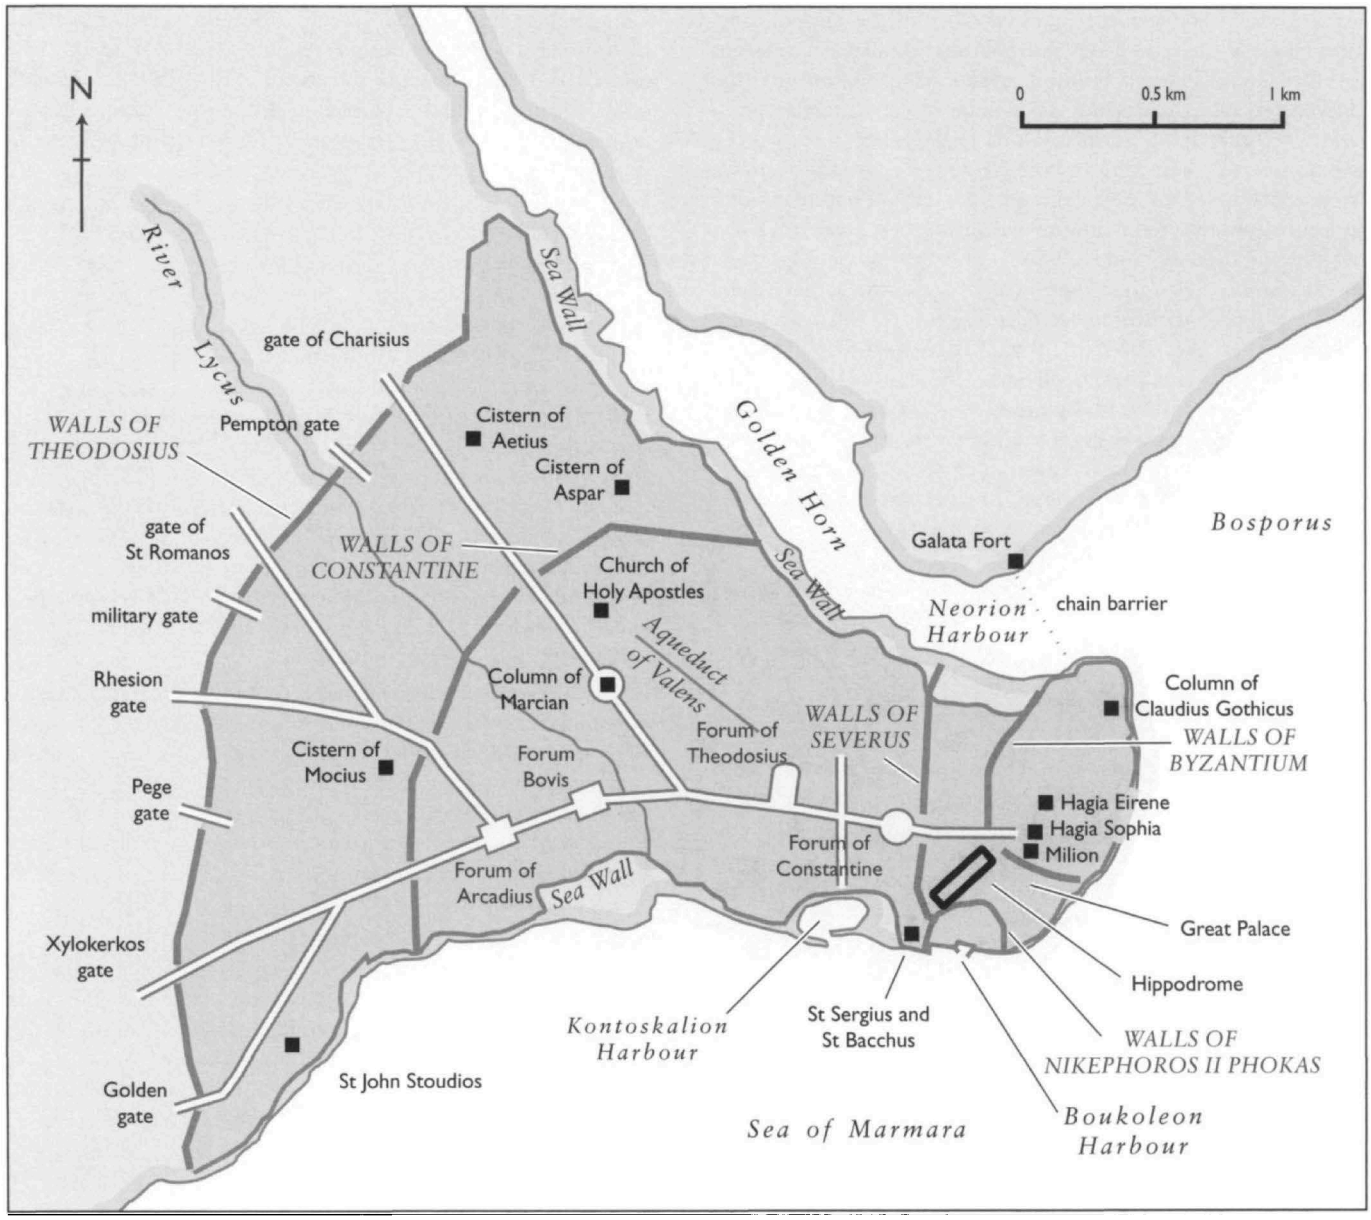
This magnificent phase of the city's history is thought to have come to an end in the 7th century. An intermittent, but devastating, plague beginning in the 530s – combined with increasing military, social, religious, and economic problems – led to dramatic urban decline. The exact extent to which these factors brought about the desertion and dereliction of the city and its public buildings is unclear, not least because of the difficulties in reconstructing urban change in 7th- and 8th-century Constantinople in general. Nevertheless, throughout almost all of this period Constantinople remained the seat of imperial government, and was both the centre of the Orthodox Church administration and the principal Byzantine trading centre. Some building certainly continued, as is evident in the 8th-century reconstruction of Hagia Eirene.

Constantinople seems to have recovered after the late 8th century. Populations from the Balkans were relocated in the city and building projects initiated. Under emperor Theophilos in the 9th century, for example, new palace buildings and churches were constructed and the walls refurbished. The middle Byzantine city once again was a flourishing centre of intellectual and artistic life and commerce, and probably grew in size. It was adorned with a large number of churches, many of which still survive as buildings today. But the city remained somewhat smaller than it had once been and had lost some of its early Byzantine facilities. Nevertheless, new buildings of this period, such as the Myrelaion (Bodrum Camii) and the Nea Ekklesia, now lost, attest to the vigour of activity in the 9th-century city. This was maintained into the 11th century, with churches such as St Mary Peribleptos and Christ Pantepoptes being built on imperial commission.

In the 10th century Western (notably Venetian) trading communities were established inside the walls. This led to the city's trade coming under the control of non-Byzantines. The Genoese acquired concessions in Galata, which later developed a semiautonomous character with its governor sent from Italy. These developments were to play a central role in the later Byzantine history of Constantinople.

Constantinople remained in Byzantine hands continuously until 1204, when it was captured and sacked by the Fourth Crusade. Like all Byzantine lands captured by the crusaders, the city was divided among the westerners. The Venetians took three-eighths of the city, the remainder going to Count Baldwin of Flanders. The burned and ruinous shell of the city was recaptured in 1261, when it once again became the capital of the, now much reduced, Byzantine empire.

After the reconquest the Byzantine emperors and aristocracy attempted to restore and rebuild the city, as is well evidenced in the magnificent 14th-century decorations at St Saviour in Chora (Kariye Camii). But, while Hagia Sophia survived, many of the grandest buildings of the past – such as the Great Palace and Hippodrome – were abandoned and in ruins. The late Byzantine imperial palace was located on the walls, in the area of the earlier Blachernae, and new structures, such as that today known as Tekfur Saray, were added. Imperial burials were no longer made at the church of the Holy Apostles but in churches elsewhere in the city, notably at the church of the Pantocrator (Zeyrek Camii) and the monastery of Constantine Lips (Fenari Isa Camii). However, most of the city lay beneath fields and the rubble of collapsed structures, while occupation centred on much smaller areas. Thus, late Byzantine Constantinople was not merely a much smaller city, but one which bore little resemblance to the city of Constantine or Justinian – except in the survival of churches and the misunderstood monuments of earlier generations. Even so, late Byzantine Constantinople was the centre of Greek-speaking culture, as well as of Byzantine architecture and art.



13. Constantinople

In 1453 the Turkish army led by Sultan Mehmet II (often called "the Conqueror") began an extended siege of Constantinople. Using batteries of large cannon – a weapon against which the Theodosian walls offered only limited protection – a sustained bombardment of the city was combined with continuous land and sea attack. The inhabitants of Constantinople, both Byzantine and Genoese, fought heroically against overwhelming odds. Despite appeals, no other western help arrived and the city came under attack from all sides. On 29 May Turkish troops entered the land walls and Giustiniani, the Genoese commander, was fatally wounded in the ensuing fighting. The Byzantine and Genoese resistance began to fail and many fled the city by sea as the Turkish army entered in ever greater numbers. Although the emperor Constantine XI Palaiologos was last seen fighting at the walls, no convincing account of his death was recorded and his body was never recovered, giving rise to much speculation about his fate. Whatever the fate of the emperor, the siege was over within hours and by afternoon the city was in Turkish hands.

Sultan Mehmet rode to Hagia Sophia and gave orders that it was to be converted to a mosque. This was carried out in time for him to attend the first Muslim service in the Byzantine cathedral the following Friday. The capture of the city was followed by several days of extreme brutality, in which the city was stripped of its remaining treasures, its able-bodied inhabitants enslaved, and many atrocities committed against them.

The city was now even more ruinous and depopulated. This presented Mehmet with a problem, as the Turkish sultan wished to be seen as heir to the Caesars. He therefore set about repopulating Constantinople with groups from other parts of the Ottoman empire – including Greeks, Armenians, and Turks. He restored the Orthodox Patriarchate, both for symbolic reasons and as a means of governing the Orthodox citizens of the Ottoman empire. With Hagia Sophia in use as a

mosque, the Patriarchate was located at the church of the Pammakaristos (Fethiye Camii) until 1586, before moving in 1601 to the rebuilt and much smaller church of St George in the Phanar district, where it still remains today.

In the following centuries of Ottoman rule, the urban topography was further Islamicized by the confiscation of many remaining churches and the construction of monumental imperial mosques, religious buildings, palaces, and tombs. The Greeks initially had only their churches as centres for communal life, although only one of these (the late Byzantine St Mary of the Mongols) remained continuously in Greek hands since before 1453. Nevertheless, during the Ottoman period specifically Greek-language schools and cultural institutions developed. Although under Ottoman rule the Greeks were only one of numerous population groups in the city, there were many of them. About 40 Greek churches existed in 18th-century Constantinople, and through the Patriarchate and the activities of scholars and clerics a sense of national identity and the continuity of Byzantine culture were maintained in the city. The wealth of merchants and officials, especially those of the Phanar district surrounding the Patriarchate, formed the core of the lay community. During the 19th century, in particular, the Greek-speaking community of the city was a vibrant cultural and intellectual centre within the broader Hellenic world.

This situation continued until the 20th century. The lot of the Constantinopolitan Greeks changed after World War I, first due to the Graeco-Turkish war of 1919–23, and later due to Greek emigration, and the Turkish immigration into the city, which has grown rapidly in size since 1900. The secularization of Turkey under Atatürk enabled the Byzantine heritage to be partially claimed by the state: for instance, Hagia Sophia was changed from a mosque into a museum. One other notable 20th-century development has been the change of the city's official name from Constantinople to Istanbul. Overall, while both the Orthodox Patriarchate and Greek-speaking community remain up to the present, the Greek community of the city is now reduced to just a few thousand people.

Summary

Originally founded as Byzantion by colonists from Megara in the 7th century BC, the city was of no particular significance until AD 326 when the emperor Constantine the Great chose it as the site of a new capital for the Roman empire. Perhaps at the height of its prosperity in the late 5th and 6th centuries when the population numbered about 500,000. Venetian trading communities were admitted in the 10th century. It was sacked by the Fourth Crusade in 1204 but reconquered in 1261. Fell to the Ottomans in 1453 but remained a cosmopolitan city and seat of the Orthodox Patriarchate, as it still is today.

Constantinople, Fall of 1453

Menaced and attacked time and time again, Constantinople had stood firm over the centuries – protected, its inhabitants believed, by no less a person than the Virgin Mary herself. Though its territories might be overrun, so long as the capital could hold out and the attackers be repulsed, the Byzantine empire could be safely reconstituted. The brutal storming and capture of the city in 1204 by the forces of the Fourth Crusade badly jolted Byzantine confidence. But, in a reversal of the past

Fall of Constantinople: 19th-century view of the siege of 1453 by Panayiotis Zographos, one of a series of scenes depicting the War of Independence commissioned by general Makriyannis in the 1830s

situation, the Byzantine world survived the loss of its capital. Out of its fragments came the successor state of Nicaea, which in 1261 was able to recover the battered city from the Latins and thereby vindicate Byzantine integrity.

Recovery of Constantinople in fact involved a burden of imperial pretension that could not be sustained by a regime of limited resources and weakened position in a rapidly changing world. Under the dynasty of the Palaiologoi the restored Byzantine state became a minor local power, ever more at the mercy of its neighbours. Losses first to the expansionistic Serbians and then to the aggressive Ottoman Turks reduced Byzantium during the 14th century to a rump state, holding a few islands and the Peloponnesian Morea but otherwise only small areas around Constantinople itself. The Turks even began a desultory siege of the city in 1394, which was broken only by the unexpected defeat and captivity of the Turkish sultan Bayezid I by Tamerlane at the Battle of Ancyra (1402).

Constantinople's ensuing breathing spell ended when sultan Murad II (1421–51) launched an attack on the city in the summer of 1422, during which cannon were first used to attack the walls. Byzantine diplomacy caused Murad's distraction and withdrawal, but stories of miraculous appearances by the Virgin strengthened anew popular convictions of the city's inviolability. Busying himself thereafter with rounding out the Turkish conquests in both Europe and Asia, Murad II made no further attempts on Constantinople. It fell to his son and successor, Mehmet II "the Conqueror" (1451–81), to claim the city that was the necessary guarantee and capital of the empire that the Turks had been recreating out of the old Byzantine world.

Emperor John VIII (1421/25–48) had sought help from the Latin west, even at the terrible cost of submitting the Orthodox Church to papal domination and doctrinal compromise, but such efforts had proved futile, only leaving his population embittered and disillusioned. There was considerable sentiment among the clergy of Constantinople against resisting the Turks, not only out of hatred for the Latins but also out of a logical desire to reunite their ecclesiastical world now largely in Turkish hands – "better the turban of the Turk in the City than the Latin mitre" went a slogan of the day.

When Constantine XI arrived in Constantinople in March 1449 to become the last Byzantine emperor, the city was in wretched state, many of its areas desolate and its population reduced perhaps to fewer than 50,000 souls. Staving off any commitment to the divisive issue of Church union with Rome, Constantine conducted stumbling diplomatic efforts to win help. Meanwhile, carefully securing himself from any other distractions, sultan Mehmet took the provocative step of building a massive new fortress (Rumeli Hisar) up the Bosporus on the European side, as a staging point from which to menace the city.

Constantine found the Venetian community willing to cooperate, but the neighbouring Genoese colony of Pera on the Galata side of the Golden Horn remained officially neutral.

Despite promises from the pope and others, contributions of aid from the Latin west were pathetically minimal. A small troop of archers accompanied cardinal Isidore of Kiev, who arrived in December 1452 in order to proclaim Church union. A private force of some 700 under the Genoese adventurer Giovanni Giustiniani Longo arrived in late January 1453 and he was given command of the defences by Constantine.

Mehmet finally began his attack on 6 April 1453. His forces have been reckoned as numbering between 80,000 and 100,000 men, plus a fleet of 120 galleys, and augmented by a set of fearsome new cannon and bombards. The Byzantines had fewer than 7000 warriors both domestic and allied, and some 26 warships, plus a few small cannon on the walls – themselves unevenly maintained but still formidable.

Despite preliminary battering by the sultan's cannon, the walls held against the first Turkish assault, and all hands settled down for a prolonged and bitter siege. Concentrated on a vulnerable area of the land walls in the Lycus valley, the Turkish artillery inflicted terrible damage, which the defenders desperately repaired as best they could. The Turkish fleet failed to penetrate the harbour of the Golden Horn or to block the arrival of some Genoese grain ships, which brought hope to the defenders. But then, on 22 April, the Turks secured access to the Golden Horn upstream by the bold feat of hauling ships overland from the Bosporus. Turkish efforts at undermining the land walls were detected and neutralized by countermining. The fighting dragged on, ever more ferocious as successive Turkish assaults failed. The incessant artillery pounding sapped morale as well as the fortifications, while the hoped-for relief never came.

There was, in fact, a real possibility that the siege would fail, and some of Mehmet's advisers counselled withdrawal. That would only have postponed Constantinople's fate, not altered it, but it would have humiliated the sultan. He decided on one final effort, planned for 29 May. The night before, the Greek and Latin defenders shared a last communion in Hagia Sophia. The attack began in the earliest hours of the morning, with successive waves of assault driven back until, by dawn, Mehmet sent in his crack Janissaries. As they began to break through, first in the Blachernai area and then at the St Romanos Gate, Giustiniani Longo received a fatal wound and had himself carried away. This spread panic among the defenders as the Turks began to pour into the city. Constantine bravely led the final resistance and was killed in the fray. By midday the city was in Turkish hands, and there began three days of pillaging and violence allowed his troops by the sultan.

Now capital of the new empire on the Bosporus, that of the Ottoman Turks, Constantinople was once again to be a great ruling city, but no longer a Greek one. The event officially ended the moribund Byzantine state, of course, even though it was not until 1461 that Mehmet's final reduction of the Morea and his capture of the separate Greek regime of Trebizond completed the conquest of the Hellenic world. But the great (and extensively recorded) drama of 1453 readily assumed symbolic status.

In grand terms Constantinople's capture is sometimes taken to mark the terminal point of the Middle Ages. For the Hellenic tradition in particular, it initiates the long ordeal of the Tourkokratia and a new phase in the defining of Greek identity. Long a subject of enduring lamentation and pain in Greek expression, the fall of Constantinople became a verdict to be reversed some day. A strong neo-Byzantine dimension of the modern Greek mentality nurtured the so-called Great Idea (*Megali Idea*) which, well into the 20th century, imagined the Greek recovery of Constantinople as the ultimate goal and fulfilment of Hellenic destiny. This mentality still lurks below the surface of enduring Graeco-Turkish frictions down to the present.

Constantinople, Sack of 1204

The sack of Constantinople by forces of the Fourth Crusade took place on the three days following the capture of the city on Monday, 12 April 1204.

The decision to divert the crusade to Constantinople had been taken at Zara on the Adriatic in early 1203 and had been confirmed in May when Alexios Angelos, the son of the deposed emperor Isaac II Angelos, had joined the army at Corfu. The decision had led to disputes within the crusading army, but the arguments for the diversion were sound, if some of the difficulties were skated over in the debates. Alexios had promised the sum of 200,000 marks, a Byzantine reinforcement of 10,000 men for one year, and thereafter, for the term of his life, a garrison of 500 men to defend the Holy Land. In addition, on ascending the throne, he would bring the Greek Church into canonical obedience to Rome. The crusading army had arrived at Constantinople in July 1203 and effected the restoration of Isaac Angelos and made Alexios joint emperor. Alexios was unable to fulfil his extravagant promises and Graeco-Latin relations had deteriorated. In August and November 1203 two fires started by Latins had caused much damage to residential property in the city, including the destruction of the mansion owned by Choniates. In March 1204 the Crusaders were in desperate straits, able neither to go on their way nor to stay without Greek support and provisioning. It was desperation that led to the plan to attack the city and on 12 April, much to their surprise, they managed to capture Constantinople, an enterprise that substantial Arab, Russian, and Varangian attacks in the past had failed to achieve.

As was traditional with a city captured by attack, the victorious forces were allowed three days of pillaging, but on this occasion it was to be looting limited by rules. Details of the horrendous events involved are given by the Greek civil servant and historian Niketas Choniates in his moving account of his own and his family's experiences in those three days. Western eyewitness accounts largely ignore the accumulated hatred and greed, the pillage and rape that accompanied their capture of the city. As the victors, surprised by their own success and seeing in it the hand of God judging the arrogant Greeks, the crusaders rapidly ran out of control and blatantly ignored the guidelines laid down by the crusading leadership prior to the assault on the city that women and churches should be left inviolate. The Latin commentators were clearly ashamed of the acts of their fellows. The crusading leadership took firm measures to re-establish control on 15 April by hanging looters, but it took some months before the details were reported to the pope in Rome. No Latin source even hints at rape and only one source mentions the looting of churches. The chronicle of Robert of Clari suggests that churches were indeed spared, yet he himself donated ecclesiastical spoils to the abbey of Corbie on his return to France. The sacking of the city was almost immediately condemned by Greek and Latin authorities in terms that were subsequently used to characterize the crusade itself and later Greek and Latin relationships in general. Niketas thought it better if Constantinople had been captured by the infidel rather than by these western Christians, drawing unflattering comparisons between the crusaders in 1204 and Saladin's restrained behaviour in Jerusalem in 1187. Innocent III, although his first letters referred to the capture of the city as an act of God, when he learned of details of the sack, condemned it: "those who should have used their swords against the infidel have covered them with Christian blood."

There has been much scholarly controversy as to what was taken and how much, a debate best summarized by Queller and Madden. Robert of Clari stated that neither Charlemagne nor Alexander had seen so much booty in one city and that there was more wealth in Constantinople than the world's 40 next richest cities combined. The plunder was to be gathered under guard into three churches in the city, but it was clear that much was held back by individual looters. The chronicler Geoffrey de Villehardouin records that a total of 300,000 silver marks was thus collected together, although he estimated that the total booty pillaged from Constantinople was in the region of 800,000 marks, a good 63 per cent kept by individuals. Most of these escaped detection and only a few were caught and hanged, like the unnamed knight recorded as belonging to the retinue of the Compte de Saint-Pol. For the poor among the crusading hosts expecting much from the wealthy city of Constantinople this was a source of great disappointment. In the final division each knight received 20 marks, each sergeant and cleric 10 marks, and each soldier 5 marks.

Constantinople was the richest repository of Christian relics, housing the Crown of Thorns, pieces of the True Cross, the hair of the Virgin, the head and arm of John the Baptist, as well as various parts of the apostles and other saints. These were unashamedly looted by western ecclesiastics such as Martin, abbot of Halberstadt, and others eager to endow a church or monastery back home.

Libraries did not escape the general destruction and some Classical texts read by Greek scholars before 1204 and otherwise unknown today were lost for ever at this time including works by Callimachus and Hipponax. Apart from precious gems and metals and relics, much damage was done to Classical statuary, which had been brought from all over the ancient world to adorn the city. Most of this was melted down to provide currency; other items, such as the four bronze horses from the Hippodrome, were taken west to adorn the entrance of San Marco in Venice.

Constitution

Greece's political history is inextricably linked with its constitutions: ever since the War of Independence the constitutional texts have been a powerful symbol embodying the principles of the organization of Greece's political life as well as an image of the balance of power within society.

Among the first acts to be undertaken by the insurgent Greeks, once the military situation had somewhat stabilized,

was the drafting of a constitution: as early as January 1822 representatives from different parts of revolutionary Greece voted for the first constitution in an assembly near the site of ancient Epidaurus. This first constitution was followed by another two, in 1823 and 1827 respectively. The constitutions of the revolutionary period were very liberal in their provisions. They drew from the French tradition, but were also influenced from pre-independence works, such as the writings of Rigas Velestinlis and the anonymous work *Elliniki Nomarchia* (The Greek Prefecture). The constitutions of the War of Independence provided (among other things) for an independent judiciary; power sharing between the legislative and executive branches of government; freedom of press, religion, and expression; they outlawed torture and slavery and declared that slaves arriving on Greek soil would be automatically considered free; and declared that no hereditary titles were recognized or conferred by Greece. They also declared that all Greeks living permanently in Greece as well as non-Greeks who had fought in the War of Independence would be entitled to Greek citizenship. Their most striking feature, however, was that they were republican, a practice contrary to what was the norm for European government at the time. The 1827 constitution was probably the least liberal, as it provided for a voluntary though temporary transfer of power from the legislative branch to Ioannis Kapodistria, the head of the executive, who had the title of Governor. Between the assassination of Kapodistria in 1831 and 1844 Greece did not have an operative constitution; the 1832 Convention of London declared Greece a monarchical and independent state; and a constitution was not a priority for either the regency or King Otho himself. However, in September 1843, an uprising in which the Athens garrison participated forced Otho to grant a constitution. The 1844 constitution, apart from the separation of the executive, legislative, and judiciary branches, also provided for a two-chamber assembly (the Boule and the Gerousia); it also provided for almost universal male suffrage (some property requirements were included).

After the fall of Otho and the election of George I, another constitution was drafted, the lengthy proceedings of the Constituent Assembly being speedily concluded at the insistence of the king. The new regime was one of *vasilevomeni dimokratia* (literally "a democracy under a king"); the king's role was to reign but not to rule; this was rather misleading, as the king had substantial powers, especially in the foreign-policy field. Nevertheless, to be valid the sovereign's actions had to be countersigned by the minister(s) responsible. The 1864 constitution was more liberal than its predecessor, providing for a single-chamber assembly (the Gerousia was abolished) elected by universal male suffrage; the members of the Assembly, it was declared, represented the nation (as opposed to their local constituencies). The new constitution further strengthened the popular rights and liberties; it also included provisions for local government. The 1864 constitution has been the longest-lasting to date, almost half a century elapsing before its revision in 1911.

The 1911 constitution was (as in 1844) the indirect result of another coup. Following the 1909 Athens garrison pronunciamento at Goudi, Eleftherios Venizelos was invited to assume government. At his insistence the 1864 constitution was revised, though not radically. The most radical change was the addition of the principle of *dedilomeni* (literally "declared majority") stipulating that the sovereign has to ask the leader of the largest party of the Assembly to form a government. The principle had operated since 1875, but only in 1911 was it included in the constitution. Other changes included compulsory free education for all; the establishment of a Council of State (*Symvoulio Epikrateias*, high administrative court), tenure for civil servants, a prohibition against serving officers to be simultaneously in the armed forces and in Parliament, and a reduction of the quorum of the parliament (intended to reduce filibustering). Another change in the wording of the article regulating the conditions under which the state had the right of compulsory purchase of property in cases of public need (rather than for "public benefit" as in the text of the 1864 constitution) heralded the break-up of large estates and large-scale land redistribution, measures that would later be used extensively to solve the peasant and refugee problems in Greece.

The 1927 constitution was once more promulgated following an upheaval: the Asia Minor debacle and the antimonarchical movement that subsequently prevailed. It was the first republican constitution since the War of Independence, introducing the notion of *avasilefti dimokratia* (literally "democracy without a king"). The freedoms enshrined in the 1911 constitution were further safeguarded; the parliament became bicameral once more, with a second chamber (Gerousia) reintroduced; the state was provided with greater power to effect compulsory purchases of property in exceptional circumstances, something that made possible the redistribution of the remaining large estates to refugees and other landless peasants; and safeguards regarding the monastic state of Mount Athos incorporated to the Greek state after the Balkan Wars were also included; these latter were repeated almost verbatim in subsequent Greek constitutions.

The period from 1936 to 1952 was one of major turbulence for Greece: the 1927 constitution was suspended in 1936 when General Metaxas took power; war, the Axis occupation of Greece, and the Civil War effectively continued the suspension until 1949. Martial law was in force after 1947 and was only lifted in 1950. It was only in 1952 that a new constitution was drafted. It was more conservative than its predecessor; it formally restored the monarchy, returning to the *vasilevomeni dimokratia*; it abolished the upper house of parliament (Gerousia); and for the first time it gave the vote to women. Though it safeguarded individual rights, the safeguards were often theoretical, given the complexity of anticommunist "compulsory law" legislation in place since the Civil War period. The most serious shortcoming of the constitution was once more the relatively extensive powers of the king; and, in a more general sense, the cavalier way in which the palace dealt with the restrictions the constitution imposed on royal power. It was this rather than the shortcomings of the constitution that led to the instability of 1965 and eventually to the Colonels' coup.

During the 1967–74 period the military junta produced two constitutional texts, the first in 1968, the second in 1973. They were highly authoritarian constructions, institutionalizing the role of the armed forces in politics and according them a say in every important aspect of government. Beyond its undemocratic character, what is notable in the first of the two constitu-

tional texts is a measure of republicanism in the form of the gradual erosion of the powers of the monarchy; however, this was the result of the king's abortive countercoup of December 1967 rather than of the republicanism of the drafters. The 1973 constitutional text actually abolished the monarchy, creating a presidential democracy, in which the president (with a seven-year term of office) held considerable powers and even appointed the three most important ministers and 10 per cent of the members of parliament. Neither of the two texts was ever fully put into effect; both were declared null and void after the fall of the Colonels' regime in 1974.

Upon his return in July 1974 Karamanlis reinstated the 1952 constitution, with the exception of the clauses related to the monarchy, until a plebiscite decided its future. Following the result of the plebiscite in December 1974, the monarchy was abolished and a new constitution was drafted.

The 1975 constitution had the strong imprint of Karamanlis. It declared Greece a *proedrevomeni dimokratia* ("republic headed by a president"). The model followed was to an extent that of the French constitution of 1958, almost creating a twin-headed executive. Though the regime was not presidential, the president (elected by the parliament with a special majority) had considerable powers, even though he could only exercise them in exceptional circumstances: under certain conditions he could call a referendum, grant amnesty for political crimes, even dismiss the prime minister. All these features gave the 1975 constitution in its initial form at least a degree of latent presidentialism. The system was never put to the test. The first president was the self-effacing academic Constantine Tsatsos, a close associate of Constantine Karamanlis, prime minister between 1974 and 1980. After 1981, when a conservative president (Karamanlis) "cohabited" with a socialist prime minister (Andreas Papandreou), the former carefully avoided using the powers given to him by the constitution.

The 1975 constitution was revised in 1986, at the initiative and under the influence of the PASOK government of Andreas Papandreou. The 1986 revision abolished almost all the powers of the president, making him simply a figurehead; it also proportionately strengthened the office of the prime minister, moving the constitution towards a more orthodox republican parliamentary system.

There have been a number of criticisms levelled at the 1975/1986 constitution. Its critics say that it failed to disestablish the Church; that it has not limited the number of members of parliament (currently 300), judged by some as excessive for a country with a population of 10 million; and more importantly that it has not enshrined the electoral law in the text of the constitution, allowing successive governments to change it according to what they expect to be the most beneficial model for them. All these, as well as the redefinition and strengthening of the role of the parliament, are being debated in view of another projected revision of the constitution.

Contraception

Ancient and medieval Hellenic peoples employed contraceptive drugs administered topically and orally as one of a variety of means of birth control. Soranus (*fl.* AD 98–117) said that "a contraceptive (*atokion*) differs from an abortive (*phthorion*), for the first does not let conception take place, while the latter destroys what has been conceived." Even though the Greek language distinguished conceptually between contraception and abortion, writers often mixed the two actions, according to modern scientific nomenclature. Generally the pharmaceutical actions were hormonal, usually stimulating or decreasing either oestrogen or progesterone, resulting either in contraception or disruption of implantation. The latter we call an abortifacient, but to early Hellenic people the distinction was not so sharp. In ancient and Byzantine times it was thought that the sperm remained in the womb for a period of weeks before acceptance and foetal formation.

Plato and Aristotle regarded population control as a function of the state, whereas Polybius and other Hellenistic figures thought that a decline in Greek influence was attributable to decisions by families to have fewer children. Medical sources regarded contraception as preferable to abortion because of the relative safety of the former. A Homeric hymn, for example, thought that Zeus permitted the Trojan War because the earth had too many people. In the Greek myth, Persephone was told not to eat anything but she disobeyed by eating a pomegranate, a widely used contraceptive in Greek and earlier Near Eastern cultures.

The most famous contraceptive was silphium, the name given to a small tree of the *Ferula* genus, whose contraceptive qualities were discovered and marketed by Greek colonists in Cyrene. The Cyreneans enjoyed a virtual monopoly because attempts to transplant and cultivate it failed. By the 1st century AD the plant was very scarce and expensive. The last reference to it occurs in a letter by Synesius of Cyrene (4th century) who reported that his brother had some growing on his farm. The plant is known to have been an effective contraceptive because plants of related species that later Greeks substituted for the extinct silphium have been proven to be effective contraceptives in animal and human testing.

Coitus interruptus was seldom employed as a contraceptive measure to judge by the paucity of references to it. Those few references, however, indicate that the procedure was known. Barrier methods were not known. Some pessaries prepared as drug prescriptions with specific ingredients and administered on wool pads could possibly have resulted in mechanical blockage of sperm progression. The Hippocratic work *On Generation* (5. 1) said that the practice was for women who did not wish to have a child to expel "the sperm from both partners". Contrary to a number of philosophers, Aristotle regarded males as the sole providers of sperm, and hence the source of life, with women supplying only nourishment.

Magical devices in the form of amulets, talismans, and incantations were employed as contraceptive means. Soranus, the gynaecologist of the early 2nd century, ridiculed such means, although Galen and other Greek medical writers sometimes included these devices among the contraceptive prescriptions. The anomaly is that from the standpoint of modern pharmaceutical knowledge the drug prescriptions were to some degree effective. For example, Aetius of Amida (*fl.*AD 502–25) attested to the efficacy of wearing weasel liver, this among otherwise perfectly rational medical lore.

The existence of male contraceptives was known but seldom were details related. Dioscurides (*fl. c.*AD 50–70) related that a plant called *periklymenon* was a male contraceptive, but this plant has never been identified. In Talmudic sources there are references to unspecified root poisons that prevent conception when used by both males and females. Galen said that the chaste tree (*Vitex agnus-castus* L) was employed by athletes and certain priests to prevent erections. Recent tests using an extract of the plant show that in dogs its action is to disrupt sperm production. The paucity of references to male contraception, however, probably indicates a seldom-employed practice.

Christianity did not make a great distinction between contraception and abortion. It is not until the 19th century, with developments in embryology and instrumentation, that the distinction between a quickened (a formed, hence, ensouled) foetus and an unquickened (unformed, no soul) foetus was dropped in the West. The Eastern Churches, however, were more definitive about early abortions. Generally, the Churches were against any form of human interference with fertility. Contraceptives and fertility-enhancement drugs all were condemned. Even so the medical records in Greek during the Byzantine and early modern periods continued to have information about contraceptive and fertility-enhancing drugs.

Conversion to Islam

Conversion to Islam is deceptively simple: it is by attestation and circumcision. It is absolute and, under sharia law, the penalty for reversion is death. This entry is limited to examining the conversion of Orthodox Christians within the former Byzantine empire to Sunni Islam between 1071 (when the Seljuk Turks, themselves relatively recent converts to Islam, entered Anatolia) and 1839 (when apostasy from Islam ceased to carry the death sentence under Ottoman civil law). It omits cases, particularly during the 14th century, of conversion from Islam to Orthodoxy, of conversion to Judaism (which both St Gregory Palamas and a mullah agreed heartily to condemn in Nicaea in 1354, the Muslim position being that only conversion in the forward direction of the "sequence of revelation", from Judaism to Christianity to Islam, was acceptable), and of conversion through ecstasy or revelation (converts such as St Paul who was granted light on the road to Damascus are statistically insignificant, although their subsequent evangelism should not be overlooked). Most convert through external factors, yet without overt coercion, for social and economic reasons. Given that generalization, further factors may be considered as to how Christian Anatolia became Muslim Turkey. They are that Islam is a culture as well as a faith; that while conversion is a matter of a moment, subsequent acculturation may take generations; that in the early Ottoman state there was a demographic problem in that there were too few Muslims and of these too few were Turks; that converts try harder but are least appreciated by their new community; that in the folk religion derived from local and ancient cults there was a no man's land between the official orthodoxies of the Church and Islam over which a common Anatolian peasant culture could stray (few actually "converted" from either); that official Orthodoxies were associated with the secular rulers of Constantinople (which is why local Churches, such as the Armenian, might fare better under Islam than an imperial or *Melkite* Church); that while it cannot be demonstrated that Ottoman *defters* (tax registers) are any more reliable than most medieval registers, their classification of households by religion offers the first statistics of conversion that we have (though they were made for secular purposes, which in some respects makes them more trustworthy).

These questions may be illustrated within two major phases, of symbiosis and transition up to about 1520, and of consolidation thereafter. In the first phase Christians lost their daughters, their official faith, and their demotic language –

usually in that order. In intermarriage the Greek dowry and Turkish bride-price were directly opposed, and in such situations the bride-price usually won. But both were a luxury except among the extensive sequence of marriages between Orthodox princesses and Muslim rulers from 1297 to 1461, in almost all of which the bride kept her faith, at the price of none being regarded as a marriage under Orthodox canon law, or the bride became senior consort (*ulu hatun*), unless converted. The position of these women was part hostage and part protector of Christians in Muslim lands, and ended in 1476 with the death of Mara Brankovich, Sultan Mehmet II's revered Christian stepmother, when there were no further Orthodox rulers to take notice of. Of the more extensive seepage of women into Turkish hands there is less record. The Ottoman invasions of Europe from 1354 required manpower. The system of *devshirme* ("recruitment" in Turkish) or *paidomazoma* ("harvest of children" in Greek), in which children were brought (and converted) into Ottoman service, was in place by 1395. A dynamic of the self-perpetuating Ottoman Balkan expansion of the next century consisted of first-generation converts conquering the next, turning east only to take Byzantium before dealing with older Muslim powers in Anatolia – a repetition in miniature of the original expansion of Islam. The shockingly swift collapse of the Orthodox Church in Anatolia after 1071 followed the loss of imperial patronage, while its economic base passed to successive Muslim states, usually as *waqf* (charitable foundation). The collapse of the imperial Church with its state was halted only by its adoption as an instrument of government by the Ottomans after 1453. In Anatolia conversion was eased by Bektashi, dervish, or seductive Sufi teaching of many ways to truth, and of syncretistic texts, such as the so-called Gospel of Barnabas – a twilight world in which the Anatolian peasant could find his way around.

Although there were still exceptions, the basic social and economic distinction between Christians who paid head-tax and Muslims who entered military or administrative service was well established by 1453, which made it crucial for the state to identify who were Muslims and who Christians. Marriage and *devshirme* added to natural conversion to Islam, but they were not enough. Mehmet targeted cities and used resettlement (*surgun*), encouraging Muslim settlers and moving the former Christian elites elsewhere. By 1477 Constantinople was 58 per cent Muslim, but was restored to its position as the largest Orthodox city in the world; few of its citizens had known the capital before 1453 and local mosques, such as Rum Mehmed Pasha's of 1471 in Chrysopolis (Üsküdar), were built by converts.

Two other cities raise questions of population and conversion. When Mehmet II took Trebizond (Trabzon) in 1461, it had a notionally 100 per cent Christian population of about 4,000. By *surgun* he brought in Muslims, some evidently Albanian converts, with the result that by 1486 the Muslim to Christian ratio was 19:81 per cent. But it did not work. By 1523 the ratio was 14:86 per cent. The place was in danger of becoming wholly Christian again. There was a second *surgun*. In 1553 the Muslim to Christian ratio was 47:53 per cent and by 1583 had turned tables to 54:46 per cent, when the city had a population of more than 10,500 and still more Christians than there were to start with. The critical time is when the Muslim/Christian ratio reaches about 45:55 per cent, when whole parishes, paying fixed levies, convert in landslides. Two points may be made. First, by 1583, 43 per cent of the Muslims of Trabzon are identifiable as first- or second-generation converts, which suggests that (unlike Constantinople) more than 70 per cent of its citizens were linked to its population of a century before. One may convert overnight, but it is more difficult to wake up speaking Turkish in the morning. Thus some Pontic people speak conservative Greek and are, or become thereby, conservative Muslims. The second point is that from the reign of sultan Suleyman the Lawgiver (1520–66) those who were going to convert did so. But nothing is typical.

One case is Thessalonica (Slav Solun, Turkish Selanik, Hebrew Slonki), which was conquered in 1430. From 1478 to 1519 it tripled in population to around 30,000 souls, but they were different tenants of the same Macedonian city. In 1478 the Christian element had an absolute majority of 59 per cent; by 1500 the Muslim population had grown to a simple majority of 42 per cent, when a third category appears, of Sephardic Jews, expelled from Spain after 1492 and astutely welcomed by the Ottomans to Thessalonica to make a demographic balance, where in 1519 Hebrews are registered with an absolute majority of 54 per cent, which they maintained in the largest Jewish city in the world until 1666. In that year a Thessalonian Jewish false Messiah, Sabbatai Zavi (1625–76), converted to Islam. He had been a nuisance to the Ottoman civil order, but that was not a solution, for he took large numbers of his flock with him, creating further problems of identity.

The followers of Sabbatai, called *dönme* in Turkish, are a common enough phenomenon in a world of secret, or dual, faiths and simple misregistration. When in 1571 the Ottomans took Cyprus and restored the economic and political status of its Orthodox Church, Roman Catholics had no recognized status. There was the theoretical choice of Orthodoxy or Islam. Some at least became *linobambakoi*, crypto-Christians, and preferred to remain so long after it was safer to conceal one's faith. Dual faiths had political and economic advantages, depending on whether it was a head-tax collector or a recruiting officer who asked the questions. Eighteenth-century Albanian transhumants traditionally changed their faith by season. Politically the great Druse emir Bashir II Shihab (1788–1840) of the Lebanon found that the best way to square the demography of that country was to become a Maronite Christian as well. But the largest group of crypto-Christians, perhaps seeking the best of both worlds, were from the Pontus, and "came out" in 1867. They were Christians indentured to the silver-mining economy of Gümüšhane, who were excused head-tax in return for a corvée. When the mines were exhausted after 1829, they declined either to pay Christian tax or to undergo Muslim military service. Significantly the Orthodox Church was slower to recognize them as Christian than the Ottoman state, which had always been reluctant to carry out the penalties of sharia law. Martyrs are troublesome and after 1839 apostasy was no crime. But this is not to question faith. The last recorded Neomartyr of the Orthodox Church was St George of Ioannina, also known as Hasan,

who, accused of apostasy from Islam, died steadfast in his faith on 17 January 1838.

Copais, Lake

Drained lake in Boeotia

Lake Copais is the fourth in a series of basins in a great valley running with the river Kiphisos from west–northwest to east–southeast for some 130 km. The corridor is separated from the Gulf of Corinth to the south by the ranges of Mount Parnassus and Mount Helicon, the latter directly south of Lake Copais. The lake was formed through crustal disturbance and enlarged through erosion and dissolution of the surrounding limestone. It was fed by the waters of the Kiphisos, which then progressed towards the sea through limestone ridges and the lakes Iliki and Paralimni. Sedimentation in the lake bed led to an increasing shallowness of the water; before 1886, seasonal changes in temperature caused an alteration between lake in winter and swamp in summer.

Archaeological survey and excavation have revealed Palaeolithic and Neolithic occupation around the lake, and shown that the region was relatively densely inhabited in the Bronze Age. Tradition recorded by Strabo (9. 415) and by Pausanias (1. 9. 3, 8. 33. 2, 9. 38. 7) held that the "Minyans" (after the mythical king Minyas) had drained the lake and cultivated the plain. The archaeological evidence for the drainage of the lake rests on two bases: observations of dykes, drainage, and canal works in and around the lake, and an apparent system of fortified enclosures or settlements encircling the lake.

The known ancient drainage works include two immense canal projects: one canal was created on the south and east side of the lake, the other on the north side; these were united at Agia Marina, in the northeast corner of the lake and about 1 km north of Gla. These canals are breathtaking examples of Mycenaean hydrological engineering works. With a combined length of over 50 km, they seem to have been designed to channel the waters of the Kiphisos and Melas rivers, and perhaps of smaller tributaries, away from the central bed and towards the north and east, where natural sink holes take the water to the sea. The canals are massive, in correspondence to the volume of water involved. At one point on the southern route the channel is 41 m wide and enclosed on one side by a dyke 19 m thick. Where the two routes meet, the channel is as much as 60 m wide. Archaeological investigations have been sporadic, but where observations have been possible the dykes have been revealed to be stone-built constructions.

Gla is the largest of a series of Mycenaean fortified sites around the lake. In the northeast section alone three other fortified sites overlook the plain, and elsewhere they include a fort at ancient Haliartos overlooking the southern channel and several sites on the north side. Although Gla is the only one of these sites to have been seriously investigated, the indications are that, with Gla, all of these sites were founded in the Mycenaean heyday and their period of use did not extend much beyond the end of the Mycenaean palace period. This suggests very strongly that the entire system of fortified sites and drainage projects formed a cohesive unity in draining, maintaining, and protecting the lake bed.

Gla is by far the largest of Mycenaean fortified sites, enclosing an area ten times that of Mycenaean Athens or of Tiryns, and seven times that of Mycenae itself. A massive Cyclopaean wall generally 3 m thick runs for 2.8 km around the perimeter of a rocky outcrop that would have been an island before the lake was drained. It is pierced by four gates, one of them double; from two of these gates, roads have been traced for some distance into the plain, further proof of the effectiveness of the drainage operations. The enclosed area, nowadays barren rock and scrub, appears to have been relatively open in Mycenaean times: only a central portion in front of the southern gate and running to the north wall was built upon. Part of this appears to have been taken up with stables and storerooms. Towards the north, where the rocky islet reaches its summit, an L-shaped block of rooms forms what is assumed to have been the administrative and perhaps religious centre of the site. These rooms, generally small, were plastered and painted and show some of the refinements of Mycenaean palatial architecture. The built area occupies less than one quarter of the enclosed area of Gla; it may be that temporary structures occupied the rest of the area, especially during the construction phase of Gla itself and the drainage projects in the lake.

Important Mycenaean sites are located at Thebes to the southeast and Orchomenus to the west. Recent fieldwork suggests that hydrological works extended as far as Orchomenus in the form of a small artificial lake created in the vicinity of the town. Orchomenus is thought to have been the site of a Mycenaean palace and certainly boasted the greatest of all tholos tombs, the Treasury of Minyas, which was modelled on the Treasury of Atreus at Mycenae. It seems logical to assume that the drainage of Lake Copais was orchestrated from there, and that, beginning with Gla, a number of fortified settlements were constructed to maintain and control the drainage system and the agricultural land that resulted from it. If Thebes were in any way a hostile centre, that would further explain the fortifications.

By the historical period the drainage system seems largely to have collapsed, probably in the wake of the collapse of Mycenaean political structures *c.*1200 BC. Sporadic attempts were made either to repair the system or to undertake new drainage projects, some of which may well have been smaller-scale but nevertheless successful. Crates of Chalcis, under the tutelage of Alexander the Great, is supposed to have attempted to drain the lake; perhaps the most striking remnant of this

period is a tunnel at the northeast end of the lake, unfinished but destined to carry the waters off to the sea in much the same direction that the (presumably blocked) sink holes had done in previous years. Other repairs were undertaken in the Roman period, but it appears that the lake was never again drained in any systematic manner; instead small-scale, localized projects were undertaken.

In 1873 the Anglo-Hellenic Copais Company was formed to undertake a project of drainage at the invitation of the government, after an unfulfilled attempt in 1865 by a French company. The drainage was complete by 1886, at which time 25,000 hectares of land were reclaimed. The drainage was achieved by a system of canals converging on a tunnel which leads to Lake Iliki, whose consequently raised level enabled the waters to flow to Lake Paralimni and thence to the sea. The fertile basin, divided by canals and roads into a flat patchwork of cotton and wheat fields, contrasts with the otherwise variable Greek countryside. Settlements have remained strung around the lake, so that the basin is largely uninhabited.

MICHAEL J. BOYD

Summary

Lake Copais in Boeotia was, before being drained, the largest lake in Greece. Two canals with a combined length of 50 km were built in the Mycenaean period to channel the waters to the sea. Fortified sites around the lake include Gla. The system seems to have collapsed at the end of the Mycenaean period. The lake was drained again in the 19th century.

Copper and Tin

Copper was one of the earliest metals to be exploited, partly for its metallurgical qualities, but also because, like gold, it can occur in nature in its native form. However, the native metal was never a major ore in antiquity and it was an important step when it was realized that copper could be produced from other disparate-looking materials. The earliest copper production probably began in the Sinai peninsula, but the most important source of copper in the Bronze Age was the island of Cyprus. There were no major sources of copper in mainland Greece that were exploited in antiquity, although recently it has been mined on the Chalcidice peninsula. Other minor sources were in Anatolia and Palestine.

Initially, copper was used in its pure state to make tools and weapons. However, the usefulness of this material was limited by its relative softness. It was only when it was discovered that the hardness could be increased by alloying with arsenic, and later tin, that bronze became widely used, principally in armour, weapons, bowls, tripods, statuary, and tools. It was always an expensive material as all the ingredients had to be imported. It was eventually partly supplanted by iron and steel, possibly in response to a shortage of tin.

Copper production started on Cyprus in the Chalcolithic Age, 3800–2500 BC, but only reached its peak during the late Bronze Age, 1600–1100 BC. The predominance of Cyprus was due to the richness of the ores, and their early discovery. The earliest ores to be exploited were from colourful altered zones on the surface – iron and copper-rich rocks called gossan. However, the early Cypriots discovered that beneath many of the gossans lay rich deposits of primary sulphide ore, that were easier to work than the deposits on the surface. Every gossan on the island was explored for copper at this time. Production was at its maximum in the early 13th century BC, when the characteristic "oxhide" ingots were produced. The coming of the Iron Age reduced the importance of copper, but exploitation continued until the end of the Roman empire. The only ancient description of copper exploitation was given by Galen, the Roman physician, in AD 162.

The ancient mines and smelters were centred around Skouriotissa and Kalavasos. The volume of the slag heaps indicates that about 200,000 tonnes of copper was produced, mostly before Roman times. The mining was mostly underground, at depths of 185 m. Water pumps have not been found, hence the mines must have been constructed to drain naturally.

The copper deposits of Cyprus formed on the ocean floor, which was lifted up to form the Troodos mountains during the convergence of Africa and Europe. The upper part of the ocean floor was formed by volcanic eruptions of basalt. Ocean water circulated through these piles of hot lava and dissolved some of their minerals. Where these hot springs debouched, underwater cooling caused precipitation of the dissolved minerals to build chimneys and mounds – these are the well-known hydrothermal vents, or "black smokers", still to be found at mid-ocean ridges, particularly in the Pacific. These chimneys are rich in sulphide minerals, such as pyrite and chalcopyrite, the main copper mineral. The copper ore of Cyprus always contains a little gold, but not usually enough to be exploitable. However, some gold was concentrated during weathering of sulphide deposits on the sea floor to produce ochre. This was exploited for gold in antiquity, but was never a major source of the metal.

The copper ores were smelted in several steps. The sulphide ore was roasted in air to convert it to the oxide. This was mixed with a flux of quartz and iron-manganese oxides (umber), to increase the fluidity of the molten material, and charcoal to react with the oxygen and convert the oxide to the metal. The raw metal was refined by remelting and cast in "oxhide" ingots weighing about 20 kg.

Copper has many useful qualities, but it is not a hard metal. This is why the discovery that the hardness of copper could be improved by alloying with other metals was so important. The first alloys were with arsenic. This occurs with copper at a few

deposits in Cyprus (Pevkos, Laxia tou Mavrou), and smelting would have made a natural alloy. Later it was found that the addition of tin made the best bronze. This discovery was long in coming, partly because tin and copper occur together so rarely.

Most deposits of tin are associated with granite. The main ore mineral is the oxide, cassiterite, which crystallizes in the granite itself or from watery fluids released during crystallization. This heavy, resistant mineral is released when the rock is weathered and can be concentrated in river sediments in the same way as gold. Such placer deposits were easily exploited once the value of the mineral was determined. There are no major sources of tin in the Aegean region. A minor source in eastern Turkey was exploited in the Bronze Age, but most tin must have come from much more distant sources. There are minor deposits of placer tin in the Eastern Desert of Egypt, but tin-bronze was not used there before 2000 BC, and there is no evidence that it was exported. One possibility is that tin came from Malaysia, a region still rich in tin today. Later on, the Iberian peninsula became an important source. Southwest Britain may have been another source – it was certainly exported from there by Roman times. Cassiterite was smelted by heating with charcoal.

Another important copper alloy is brass. This copper-zinc mixture seems to have been known in Greece from about 700 BC, possibly by the name *oreichalkos* (copper of the mountain). Early brass may have been made by smelting natural mixed copper-zinc ore, possibly in Cyprus or Asia Minor, but it is difficult to get much zinc into the copper by this process. Later on, high-zinc brass must have been made by deliberately alloying zinc and copper. This is difficult as zinc boils at a lower temperature than copper metals. It is possible by heating copper metal, zinc ore, and charcoal powders in a closed crucible at 920° to 1000°C.

Copts

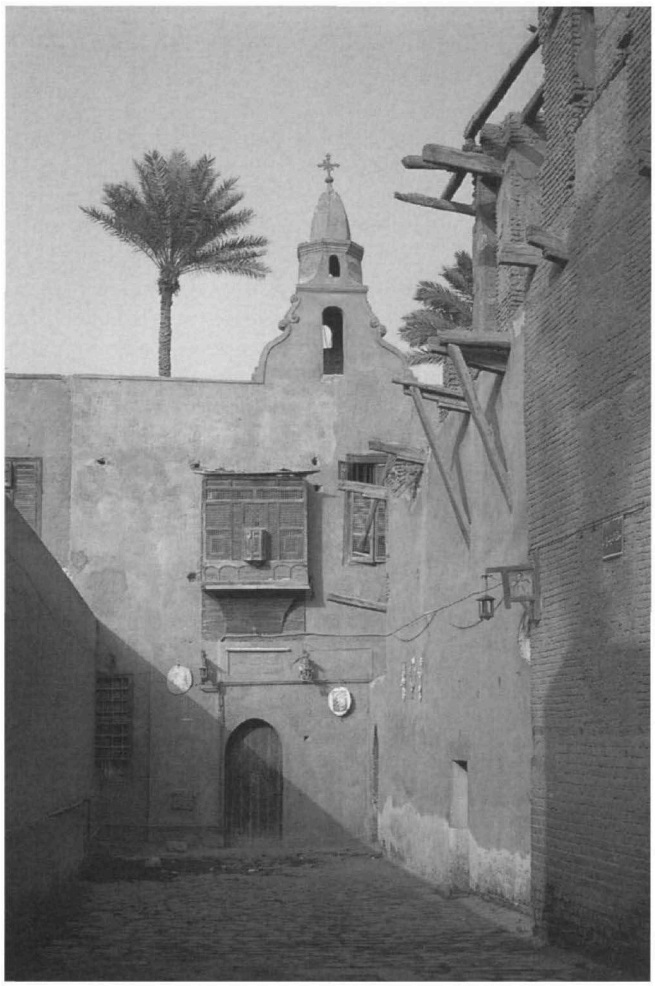
The term "Copts" was first used to identify the native Egyptians (as opposed to the Macedonian-descended Alexandrians) possibly as early as the Ptolemaic period, but from the 4th century AD it was applied predominantly to Egyptian Christians. It was in all likelihood associated with *Aigyptios* (Egyptian), but reduced to the root consonants *KPT* and pronounced "copt".

The Coptic language, however, seems to be older than the Ptolemaic era, appearing in demotic and on some later hieroglyphic monuments. Under the Ptolemies, the Egyptians began to adopt the Greek alphabet, to which they added seven new letters to express sounds that were entirely Egyptian. The earliest "proto-Coptic" manuscript is Papyrus Heidelberg 414 dating from the 3rd century BC.

In the Roman period Coptic probably existed alongside Greek as the normal language of the Egyptian peasantry, much as Berber was used alongside Latin among the north African native population. It was Christianity that brought Coptic into prominence as the language of native Christians. In 270 St Antony heard the gospel preached in Coptic and obeyed the injunction to "sell all" and devoted himself to Christ (*Vita Antonii*, 2). In the 4th century Coptic was the language of the Pachomian monasteries, and Alexandrians, i.e. Greek-speakers, were obliged to become familiar with it.

The language would have been Sahidic Coptic, but at this time there were other Coptic dialects in the Nile valley, and probably in use in the monasteries. Thus, many of the items in the Nag Hammadi library were written in Subakhminic or Lycopolitan, and some Manichaean works were also compiled in this dialect. Sahidic Coptic, however, dominated the scene between 450 and 700. During the first two generations of the Arab conquest (642–*c.*700) the free Coptic (Monophysite) Church was flourishing, sustained by the Coptic language. Thereafter, however, decline was slow but continuous. One of the early blows was the decision in 706 of the emir Abd el-Malik that Arabic would be the sole language of his emirate's administration. With this decree began a steady seepage of educated Copts to Islam and a corresponding weakening of the Coptic language. At the end of the 10th century the emir al-Hakim (996–1026) tried to forbid the use of Coptic even as the language of the Christian liturgy. This failed, but, combined with the decline of monastic institutions at this time and the general use of Arabic among the people, the Coptic patriarch Gabriel II was induced to permit the use of Arabic in the liturgy (12th century). However, the commendation (Letters Testimonial) sent with bishop Timotheos of Ibrim in Nubia after his consecration by Patriarch Gabriel IV (1372–80) was written in Coptic on the finest paper with an Arabic translation. It shows the continued use of Coptic as a church language to the end of the 14th century. The text was not only written in the patriarchate but was witnessed by four bishops from Upper Egypt who also wrote their commendations in Coptic. By this time Bohairic, originally the dialect of the people of the Nile delta, had replaced Sahidic as the language of such Copts as had survived. Even this became extinct as a written and spoken language, probably in the course of the 16th century.

Coptic culture was expressed in art, pottery, and sculpture as well as in devotion to the one-nature, "Monophysite" understanding of the person of Christ. From the 4th to the 8th century practically all art forms in Egypt may be characterized as Coptic; some of the best examples of Coptic art come from the monastery of Apa Apollo at Bawit, which included two churches in which were carvings and frescos, one of the latter being a full-length painting of St George. Tombs of the monks



Copts: Coptic church of the Virgin in Old Cairo

buried generation after generation often contained paintings of Christ enthroned in glory with the Apostles and the Virgin standing in intercession for the soul of the deceased.

French cultural initiatives and the archaeological policies furthered during the British occupation of Egypt (1882–1922) helped to bring about a revival of Coptic studies and the consequent consolidation of the Coptic Christian minority. Notable in the development were Amélineau's studies of the Coptic Church and its martyrs and W.E. Crum's *A Coptic Dictionary* (Oxford, 1939). The discovery of the library of Coptic-Gnostic documents at Nag Hammadi has given a further impulse to Coptic studies, particularly in American and German universities. The Coptic heritage will not be allowed to perish.

Summary

The Copts are the descendants of the original inhabitants of Egypt in pharaonic times. From the 4th century AD the term has applied mainly to the Egyptian Christians. The language predates the Ptolemaic period, but under the Ptolemies the Egyptians began to adopt the Greek alphabet. The Coptic Church follows the Monophysite understanding of the person of Christ.

Corfu

Ionian island

Corfu (Corcyra in Latin, Kerkyra in Greek) has never been as "far from the busy haunts of men" as the Scheria of the *Odyssey* with which, by Classical times, it was commonly identified. Its advantageous position on the main trade route between Greece and Italy attracted Corinthian colonists (probably in 734 BC, certainly by about 705), the Eretrians from Euboea whom the Corinthians apparently expelled, and their many successors.

The main Corinthian settlement was on the Palaeopolis peninsula and included, by about 600 BC, an Archaic temple to Hera. Corfu prospered rapidly and as a result became even more independent of the mother city than most Greek colonies; in about 664 BC it inflicted a naval defeat on the Corinthians. Nevertheless, the history of founder and colony continued to intertwine: they were co-founders of the colonies of Epidamnus (*c.*625 BC; Roman Dyrrachium; modern Durazzo and Durrës) and Apollonia (*c.*600 BC) in Illyria; for a time Corfu was controlled by the Corinthian tyrant Periander (d. 586 BC); and conflict between the two states was a prelude to and a cause of the Peloponnesian War.

In 435 tension between Corfu and Corinth, the result chiefly of the islanders' perceived lack of respect for the Corinthians and lack of interest in Greek affairs more generally, became an open quarrel over the affairs of Epidamnus. Broadly speaking, Corinth supported the *demos* (ordinary citizens) of Epidamnus and Corfu reacted by supporting the oligarchs. Again the Corinthians were defeated at sea. Epidamnus was taken and Corfu, for the time being at least, was established as the dominant power in the region. The islanders could not, however, afford to stand alone, given the place of Corinth in a pattern of powerful alliances, notably with Sparta. Therefore, in 433, they formed an alliance with Athens. To avoid breaking the existing Athenian entente with Corinth this was conceived as "defensive". But later, in 433, Athenian reinforcements played a crucial role in averting the defeat of the islanders by a Corinthian armada of 150 ships; the larger war – which broke out in 431 – became more likely.

In 427 BC Corfu was riven by complicated civil war. Oligarchs and their supporters fought elements of the *demos*, who were themselves subject to internal feuding, and Athens, Corinth, and Sparta were involved both as aggressors and as mediators. When the Peloponnesians, having ravaged the south of Corfu, had withdrawn, massacres of their supporters began; the Athenians, who had 60 ships offshore, did nothing to interfere. According to Thucydides, the victims "were

accused of conspiring to overthrow the democracy, but in fact men were often killed on grounds of personal hatred or else by their debtors. ... There was death in every shape and form. ... Men were dragged from the temples or butchered on the very altars." For Thucydides these events provided a paradigm of the moral degeneration, cyclic violence, and collapse of law which would increasingly afflict all participants in the Peloponnesian War. In Corfu the fighting continued; there was a new Athenian expedition in 425 and further massacre.

The alliance with Athens was eventually ended in 410 BC but was re-established in response to Spartan activities in the Adriatic in 375. Interventions by other powers continued to be frequent; the Illyrians seized Corfu but were expelled by Rome, whose overlordship the island perforce accepted, in 229. The island served as an important bridgehead for subsequent Roman campaigns in Illyria, Macedonia, and Greece.

Under late Roman and Byzantine rule the island continued to attract the attention of outsiders. It was raided, between the 5th and 9th centuries, by Huns, Vandals, Ostrogoths, Bulgars, and Slavs. More sustained assaults came from the Normans of southern Italy and Sicily (1081 and 1147–49), seeking a stepping stone to their Greek fiefs (or intended fiefs). Later it passed to Venice (1204), the despots of Epirus (1214), Manfred of Sicily (1259), and the Angevin kings of Naples (1267). Under Angevin rule feudalism was introduced to the island; the maintaining of the rights and lands of the nobility was one of the Corfiotes' conditions for the acceptance of de facto rule by Venice in 1386 (formalized in 1402).

Through all these changes of overlord – and those that were to come – the Greek language and Orthodox religion maintained the Corfiotes' sense of Hellenic identity. (In the mid-17th century this was reinforced by the arrival of refugees from Crete, including the painters Emmanuel Tzanes (1610–90) and Theodoros Palakis (1622–92).) The Angevins had vigorously promoted the Catholic rite, but failed to make much headway against their subjects' Orthodoxy. Venice, by contrast, adopted, as in its other Greek outposts, a policy of prudent toleration. Both the Catholic and Orthodox Churches participated in public ceremonial and the Venetian republic encouraged the cult of St Spyridon, the patron saint of Corfu whose remains arrived there in 1456 and who has ever since remained central to Corfiote tradition and identity. (The basilica of St Spyridon dates from 1589.)

Venetian rule kept Corfu from Ottoman occupation. Its position on the eastern Adriatic made it valuable to the republic in both trade and war (increasingly so after the loss of mainland Greek outposts in the 15th century). Well-maintained fortifications together with a huge storm beat off the Ottoman siege of 1537; the New Citadel was completed (at enormous cost) in 1588 and further work on defences continued until 1645; in 1716 renewed fortifications, a daring sortie, and another violent storm raised a second Ottoman siege.

But if outside attacks were repelled, within Corfu the administration became increasingly corrupt; the affairs of the Council of 150 and inner oligarchy of 12 were dominated by bribery, violence, and feudal privilege. When the French took the island in 1797, soon after the fall of Venice itself, major reforms were promised and begun, but the liberators' irreligion and general failure to understand local traditions and sentiments soon lost them their initial popularity. Under the Septinsular Republic, which replaced French rule in Corfu after a long siege by Russia and Turkey in 1798–99, various constitutions were tried out. Noble privileges were restored, again removed, and again restored. (The definition of nobility was, however, broadened.) Modernization was achieved in a number of areas – especially education – under the lead of one of the republic's most active ministers, the future president of Greece, Count Ioannis Kapodistria. But heavy taxes were levied and increasing Russian domination went far to undermine the autonomy of Corfu and the other islands of the Septinsular Republic.

Greater stability was at last achieved when the French regained control of Corfu between 1807 and 1814. This time religious sensibilities were treated respectfully. The nobility retained many of its privileges but public administration and justice became somewhat more efficient and considerable progress was made with agricultural reform. Newspapers in French and Italian were printed and in 1808 the first Ionian Academy was set up.

The British protectorate (1815–64) provided roads, fine architecture (including the palaces of St Michael and St George and of Mon Repos), and an enduring tradition of playing cricket. For many Corfiotes this was a period of frustration as the movement for Greek independence and then for *enosis* (union) grew. Successive Lord High Commissioners ruled essentially as autocrats, allowing on the whole only token involvement of the Senate and Assembly; favoured Corfiotes were offered membership of the grand but powerless Order of St Michael and St George established by the first Lord High Commissioner (1815–24), Sir Thomas Maitland. Nevertheless Greek culture did flourish under the protectorate. Inspired by the struggle across the water but safe from war (and civil war) and spared the birthpangs of the troubled new state, Dionysios Solomos and his followers produced the first modern demotic Greek poetry. (Solomos, attracted by the opportunities for social and literary life, moved to Corfu from Zakynthos in 1828 and died there in 1857; Andreas Kalvos – also a patriotic poet and in part a demotic one – lived in Corfu from 1826 to 1851.) Also important in the raising of Hellenic consciousness was the setting up in 1824, by Frederick North, Earl of Guilford, of a new Ionian Academy. Andreas Kalvos and the historian and diplomat Spyridon Trikoupis taught for a time at this, the first modern Greek university. (The Academy, by then ailing, fused with the University of Athens in the 1860s.)

Some concessions in the direction of greater local autonomy were made in 1849. Continued agitation for *enosis*, together with the coming in Greece of a constitutional monarchy acceptable to Britain, finally resulted in the union of the Ionian islands with Greece in 1864. Contacts with the west, however, remained frequent through trade and increasingly through tourism, especially in the second half of the 20th century. Until the end of communism in Albania Corfu, between East and West, retained its strategic and symbolic importance. Mussolini found a pretext (the assassination of his border commissioner on the mainland) temporarily to seize Corfu town in 1923; in 1941 the Italians returned and unsuccessfully attempted "re-Italianization". They were displaced by the

Summary

Most northerly of the Ionian islands, Corfu (Latin Corcyra, Greek Kerkyra) was first settled by colonists from Corinth in the 8th century BC. For much of the Classical period it was allied with Athens. It served as a valuable stepping stone for any power anxious to make a bridgehead across the Adriatic. It was therefore often under attack and changed hands frequently during the Middle Ages and later. Finally incorporated in the kingdom of Greece in 1864.

Corinth

City in central Greece

The importance and fortunes of Corinth derive in the first instance from its position at the isthmus which bears its name; as Thucydides commented, not only did this mean that Corinth controlled the only land passage from southern Greece (the Peloponnese), to central and northern Greece, but it also gave the city access to the seas, to the Aegean and the east, via the Saronic gulf, and to the west, to the Adriatic, Italy, and Sicily, via the gulf of Corinth, thus placing the city in a most favourable position for trade.

There are prehistoric settlements in the vicinity, but none seem to be of any particular significance, and certainly do not compare to the main Mycenaean sites in the Argolid. Following the collapse of the Late Bronze Age systems, Corinthia was another area into which Dorian settlers migrated, forming a small community below the conspicuous hill of the Acrocorinth, where the spring Peirene, with others, provided an abundant water supply. The place remained small until the 8th century BC, when it began to develop rapidly under the control of its principal Dorian clan, the Bacchiadae, a closeknit group who adhered more or less strictly to a custom of endogamy. Corinth then took over nearby communities, incorporating their land and sending part, at least, of their populations overseas to colonies, the most significant being Syracuse, founded probably in 733 BC. This Bacchiad supremacy lasted, according to later authors, for a period of 90 years (i.e. three generations) after which they were overthrown by a tyrant, Cypselus, the son of a female Bacchiad, Labda, and a member of another group called the Lapiths (who may have been non-Dorians): the breaking of the tradition of endogamy puzzled later Greeks, who explained it by guessing that Labda was physically unattractive. Whatever the reality, Cypselus and his son Periander consolidated the state in a reign lasting 70 years; the last of the dynasty, Psammetichus (significantly, an Egyptian name), was overthrown after ruling for only three and a half years. Thereafter Corinth had a restricted form of government, in which control was exercised by the landed well-to-do, almost certainly only a minority in the population, who therefore turned to Sparta, whose similarly restricted constitution made it the natural friend of states like Corinth. From this time Corinth was an important but essentially second-rate city. It continued its naval interests, forming in effect the fleet of Sparta. Later, in the early 4th century BC, the Corinthians turned against Sparta and in the process almost certainly broadened their constitution.

After the Battle of Chaeronea (338 BC), and following the defeat of Athens and Thebes, Corinth, or more particularly its extramural sanctuary of Poseidon at Isthmia, was chosen by Philip II of Macedon as the locale for the great conference he called to decide the future relationship between the Greek cities and himself; the result is popularly known as the League of Corinth. Probably in reality an instrument of Macedonian control, the organization lapsed in the wars of the Successors of Alexander, but was revived in 306 BC by Antigonus Monophthalmus who was the most powerful of them. For the whole of this time, and for much of the 3rd century, the Acrocorinth was held by a Macedonian garrison; part of the fortifications built by Antigonus' son, Demetrius the Besieger, are still visible, incorporated into the later medieval and Turkish walls. Corinth was one of the "fetters of Greece" and its liberation by Aratus of Sicyon, who incorporated the city into his Achaean League, was a serious blow for the Macedonians. The freedom of Corinth was finally secured by the Roman defeat of Philip V: the Roman commander, Titus Quinctius Flamininus, ironically – and knowledgeably – proclaimed the freedom of Greece at Isthmia, in the very sanctuary where Philip II had effectively ended it. The later disloyalty of Corinth, which took the Roman freedom too literally and participated in an Achaean counteraction against Roman domination in Greece, led in 146 BC to the destruction of the city by Mummius, and the ransacking of its works of art.

Yet the site was too important to be obliterated, and a century later the city was refounded by Julius Caesar, but as a Roman, Latin-speaking colony. Some of the buildings of the Greek city survived, such as the 6th-century BC temple to Apollo, built shortly after the downfall of the tyrants. Others, such as the ruined long portico or stoa, to the south of the temple, were refurbished to serve as public buildings in the new city. The area between temple and stoa, which had been a gymnasium complete with a running course, became the forum of the Roman colony, with Roman-type temples constructed at its western end. The Roman colonists were presumably allotted estates, but it is clear that a Greek population still survived – St Paul wrote his epistle to the Corinthians in Greek, and in the course of time Greek ousted Latin. The city flourished. Although Athens was the academic centre of Roman Greece,

Corinth: Temple of Apollo, dating from the mid-6th century BC

Corinth was its political capital. This continued into the Byzantine period; one of the largest basilical churches in Greece was constructed at Lechaeum, Corinth's harbour on the gulf of Corinth. This prosperity persisted well into the middle Byzantine period, after which it suffered a sharp decline. There was a revival in the 10th century AD, and subsequently. Corinth was occupied by the Franks, and recent excavations are beginning to reveal good-quality buildings of this period. The final decline came with the Turkish occupation (1460). Acrocorinth, still a strategic key to the control of Greece, was refurbished and occupied by a Turkish garrison until the Greek War of Independence, but the town dwindled to an insignificant village. The revived Corinth of modern times was shifted to a more convenient location by the sea, on the gulf of Corinth.

Corinth's contribution to Greek civilization was considerable. Its trade links in the late 8th and 7th centuries BC both with the Near East and with the west not only brought it prosperity, so that its wealth was proverbial – "not everyone is fortunate enough to sail to Corinth" – but were also responsible, to a large extent, for the development of oriental motifs and forms in Archaic Greek art. Its painted pottery of this period seems to have been prized over a wide area (perhaps for the contents of the perfume flasks as much as their decoration) and is found ubiquitously. Less well preserved, but certainly more highly valued in antiquity, was Corinthian bronze ware. Much of this was buried in graves at Corinth itself, and after Mummius' sack of the city created a taste for Corinthian metalware in Rome. Nekrokorinthia – funerary items plundered from the graves–were highly prized by the wealthy Romans who could afford to collect them. Perhaps the most lasting contribution of the Corinthians was the creation, in the early 7th century BC, of the Doric order of architecture, for which the earliest evidence is at Corinth and Isthmia (the Corinthian order is later and developed elsewhere). All this impetus came in the crucial Archaic period. Though Corinth was less important later, its contribution to later civilization has endured to the present day.

R.A. TOMLINSON

Summary

Situated at the isthmus between the Peloponnese and central Greece, Corinth flourished as a trading city. Prosperity came early under the Bacchiads (8th century BC) and continued under the tyranny of the Cypselids (*c.*657–585 BC). For much of the Classical period Corinth sided with Sparta. Freed from Macedonian control by Rome, the city was destroyed in 146 BC. Rebuilt, the city flourished again and became the political capital of Greece during the Byzantine period. Decline set in with the Turkish period.

Corinth, Sack of 146 BC

The sack of Corinth was the event that symbolized the end of Greece's autonomy in antiquity. Its destruction had its roots in the declaration of Greek independence made by the Roman general Titus Quinctus Flamininus at the Isthmian Games in 196 BC. After defeating Philip V, king of Macedon, in the Second Macedonian War, the Romans decided not to cripple the Macedonian kingdom because they had no imperialistic ambitions in Greece; rather, they wanted Macedonia to serve as a buffer against the powers in the east, the barbarians in the Balkans, and even Greece itself. The Romans thus granted Philip favourable terms, with the stipulation that he withdraw completely from Greece, and decreed that all Greek cities were to be free and governed by their own laws. The Greeks and Romans had conflicting views on what freedom (Latin: *libertas*; Greek: *eleutheria*) meant, however. The Greeks interpreted their newly bestowed freedom as complete autonomy and the absence of Roman interference in their affairs. The Romans, on the other hand, expected the Greek states to give them their loyalty and support. As Ernst Badian has shown, foreign policy was a microcosm of the patron–client relationship in republican Roman society, and the Greeks failed to perceive this. Whereas Rome expected cooperation and a sense of loyalty, the Greeks displayed a callous disregard for them and continued to carry out their centuries-old internecine wars and struggles.

Many Greeks resented Rome's settlement with Philip. Sparta, for example, was angry that it had lost the city of Argos, while the Aetolian League was embittered when it did not receive, as it had hoped, all of Thessaly but instead saw most of the territory divided into four separate confederate states. Relations between Rome and Greece quickly deteriorated, proving the folly of Rome's hands-off policy expressed by Flamininus at Isthmia. The Aetolians invited into Greece Antiochus III, king of Syria, who was quickly taken care of by the Romans in 191 BC: Antiochus' forces were overwhelmed at Thermopylae, forcing him to beat a hasty retreat to Asia Minor. The Third Macedonian War (171–168 BC), waged by the Romans against Philip's son Perseus, proved disastrous for Greece. Although few Greek cities actually sided with Perseus, Rome's anger did not fail to fall on Greece. One thousand Achaeans were deported to Rome because of suspicious loyalty; 500 Aetolians were executed after a farcical trial; 70 Epirot cities were destroyed, with 150,000 of the population sold into slavery; and the island of Rhodes was economically crippled by the establishment of Delos as a free port.

The end of Greek independence was the result of the actions of the Achaean league. In 150 BC the surviving 300 of the original 1,000 Achaean detainees returned and found the League in conflict, yet again, with Sparta, this time over a boundary dispute. The Spartans, although members of the league, appealed to Rome for arbitration. The league, which could not tolerate such insubordination by one of its members, decided to punish Sparta; because Rome had not previously interfered with how it conducted its business, the league felt at liberty to bring Sparta forcibly back into its political alliance. Embassies from Sparta and the Achaean League went to Rome on three occasions, yet Rome did not respond, its hands too occupied with a revolt in Macedonia (150–148 BC) led by Andriscus, a pretender to the throne. In 148 BC Sparta declared its secession from the Achaean League, which then went on the offensive, quickly reducing Sparta to the brink of surrender. At this point a Roman embassy, led by Lucius Aurelius Orestes, arrived at Corinth to ask the league to see reason; Orestes even threatened (although he was probably bluffing) to dissolve the league by removing from the alliance the cities of Sparta, Corinth, Argos, Arcadian Orchomenus, and Heracleia-ad-Oetam. The reaction was furious, and a second Roman embassy, led by Sextus Iulius Caesar, failed despite conciliatory overtures. In the spring of 146 BC Quintus Caecilius Metullus, the Roman general in Macedonia, sent yet another embassy to the league, which had assembled at Corinth. The envoys were rudely treated by the assembly, heavily composed of lower-class workers who, traditionally, were hostile to Rome because of its policy of supporting local aristocracies. The League then officially declared war on Sparta, although this was tantamount to war on Rome. The Roman Senate reacted by instructing Metullus to march south from Macedonia and the new consul, Lucius Mummius, to set sail for Greece with a fleet. As Erich Gruen has convincingly argued, the league was shocked and stunned by this development: in the past the Romans had not interfered in Greek internal struggles, and so the league had assumed that it was free to punish a city that had defected from its membership. But Rome's patience had worn out and foreign policy was no longer in the hands of men like the Scipios and Flamininus; more importantly, Rome could not tolerate a war in the Peloponnese at the very time that it was settling affairs in northern Greece.

The league struck first by marching against Heracleia-ad-Oetam. Metullus soon arrived and cut the Achaeans to pieces in three separate battles. The league then ordered 12,000 slaves freed to serve as reinforcements to a ragtag army raised to defend the isthmus. Meanwhile Mummius had assumed command of the Roman army and met the Achaean army at Leucopetra on the isthmus. The Achaeans were annihilated, and Corinth was captured without resistance. Rome decided to make an example of it. All survivors were sold into slavery. The city was sacked, burned, and levelled to the ground, and its land declared *ager publicus* ("public land") and handed over to the neighbouring town of Sicyon to till. Anything that could be carried off was taken to Rome. Stories circulated of Mummius taking out "insurance policies" on priceless art treasures in the event of their being lost on the voyage home, and of soldiers playing dice on masterpieces of Greek sculpture. Greece itself was subjected to a "final solution". All leagues were dissolved, democracies were abolished and replaced by aristocracies, and the whole of Greece was put under the responsibility of the governor of Macedonia. Later, in 27 BC, the province of Achaea was established to govern southern Greece, although this merely formalized Greece's existing total

subservience. Individual cities achieved varying levels of prosperity during the empire, but mainland Greece as a political concept no longer existed. Greek independence had come to an end, but so had hundreds of years of internal strife and war.

Coronation

The silence of literary sources about any ceremony of investiture of a new Greek ruler before the beginning of the Hellenistic period, when eastern influences began to be felt, attests to the simple assumption or seizure of power, perhaps celebrated by a banquet at which laudatory speeches could be delivered. The exception is Macedon, since at least theoretically the king was elected there by acclamation of the army. A vestige of this practice persisted in Ptolemaic Egypt where, certainly until its severe ethnic adulteration in the early 2nd century BC, the Macedonian royal bodyguard retained the right of approval of new sovereigns.

Crowns (at least in the form of garlands) did exist in Classical Greece, but they were worn by priests in the exercise of their rituals, orators, and especially symposiasts. Initially vegetal, they came to be made of gold, and some delicate funerary examples of this latter type have survived. The awarding of crowns for excellence at athletic and dramatic festivals encouraged their increasing use as symbols of merit in other spheres (the most famous example is Ctesiphon's proposal that Demosthenes be crowned at the Dionysia for his sage political advice). Such crowns could be awarded also to a whole state and were so frequently expected and received by rivals in the Wars of the Successors after the death of Alexander the Great that their value was often demanded in cash in lieu of the actual artefacts, a practice which by the Byzantine period had been formalized as a tax. As symbols of their position Hellenistic monarchs held a sceptre and wore purple garments and a diadem consisting of a white cloth knotted behind with free-flowing ends (this last was first assumed by Alexander, probably to advertise his conquest of Asia since Greeks had hitherto not worn diadems to indicate kingship, while Persians had).

Early Byzantine emperors naturally followed Roman tradition, since they were Latin-speaking and nobody recognized any break in the continuity of the empire despite its new orientation. Augustus' fiction of the re-establishment of the republic meant that in theory emperors were chosen simply as "first citizens" by the will of the people, which in practice ensured that after they had taken power peacefully or by violence they were begged to assume that same power by a compliant senate. Frequently they were first acclaimed *imperator* by their soldiers, a practice that evolved from this title being temporarily bestowed upon triumphing generals by their troops. Acclamations of welcome are first documented at Trajan's accession in AD 98 and thereafter were an increasingly ritualized part of these (and numerous other) imperial occasions. An important act at accession became the distribution of largesse to soldiery and populace. The diadem, famously refused by Julius Caesar in 44 BC, was not worn by the early emperors, but in radiate form it had become the chief imperial numismatic *insigne* by the 3rd century AD.

Roman and Byzantine usurpers were regularly acclaimed initially by the army, but from the time of Julian (361) to Phokas (602) two foreign customs were frequently observed. As a ceremony of accession the soldiers would raise the new emperor in Germanic manner on a shield, an act that may have been invested with solar symbolism. They also placed upon his head a torque, which was originally a (probably Scandinavian) protective collar but whose numerous types, some heavily bejewelled, came to be worn in the Byzantine period by slaves and various military officers and civil servants.

Christianization of the ceremony of investiture was slow except in one crucial detail: the appointment of an emperor (now the vicegerent of God rather than a deity in his own right) was deemed to be made by God, whether it came about through the approval of a reigning emperor's or widow's choice by one or more of the senate, army, and people or through an actual election by one or more of these bodies. Legal and other texts, moreover, claim that emperors were crowned by the hand of God, and middle Byzantine depictions – notably a few ivory plaques – show Christ as officiant. Nonetheless, in the 4th century the site was often the Hebdomon, an army camp in the suburbs of Constantinople, and when the ceremony was transferred in the 5th or 6th century it was to the Hippodrome, a move that still emphasized its popular if not completely secular importance. Although Constantine VI was crowned in the latter as late as 776, the coronation of Constans II in the ambo of Hagia Sophia in 641 marks the increasing role of the Church, which is emphasized by the scheduling of coronations to coincide with major feasts of the ecclesiastical year. Notwithstanding, co-emperors (in Hagia Sophia) and empresses (in the Augustaion or at the church of St Stephen of Daphne) were crowned by the senior emperor, rather than the patriarch (apart from one instance in 748); and on the less usual occasions when there was no senior emperor available, the patriarch probably acted more as the leading citizen than specifically as a churchman. Furthermore, emperors remained standing during the actual coronation, as they did during the preceding and following acclamations. Accessions continued to be celebrated with banquets, chariot-racing, and the distribution of largesse. The *Book of Ceremonies* compiled by or at the instigation of Constantine VII Porphyrogennetos (913–59) exhaustively details receptions by courtiers and the factions, the actual coronation, the acclamations, and the emperor's

ascent of the throne to receive *proskynesis* (gestures of submission and reverence).

During the period of the Nicene emperors (1204–61) the coronation of co-emperors was abandoned and shield-raising reinstituted. The anonymous 14th-century *Treatise on the Dignities and Offices* (Pseudo-Kodinos) describes shield-raising outside Hagia Sophia by the patriarch and important officials in order of rank before the anointing. Pre-13th-century mention of the latter in connection with the accession of Byzantine emperors may have been just metaphorical, instigated by frequent reference in the Septuagint and reaffirmed by the Byzantine iconography of Davidic kingship, but from 1205 at the latest it was certainly actually practised immediately before the coronation itself. The inspiration may have been initially western, but Byzantines invested it with the Christomimetic symbolism of the Holy Spirit.

The Palaiologans (1259–1453), in addition to restoring the coronation of co-emperors, made a major addition in the emperor's profession of Orthodoxy that began the ceremony. This was now thoroughly integrated into the Eucharistic liturgy, but culminated in a *prokypsis* (manifestation) in which the removal of a curtain suddenly revealed on a platform the brilliantly lit emperor, who then received acclamations from an assembled throng of courtiers and clergy.

It is not clear whether all the imperial insignia were real objects (when not in use kept safe in the palace by court eunuchs) or merely iconographic (and especially numismatic) symbols. The most important was the crown, in origin the Hellenistic diadem which by the time of Constantine I had taken the form of a purple band fitted with pearls and jewels; it later developed *prependoulia* (hanging ornaments) and a superimposed cross. Late crowns (known as *kamelaukia*) contained a golden covering of the head. They were all personal, not hereditary, and were of different forms for different occasions. Remains of two 11th-century Byzantine crowns (both now in Budapest) survive. One, with enamel plaques of Constantine IX and his sisters, dancing women, and personifications of Humility and Truth, may have been made for the coronation, or wedding, of an empress. The other is the lower part of the Hungarian "Crown of St Stephen" which was given, in accord with common diplomatic practice, to Géza I, and displayed plaques to demonstrate his subordination to Michael VII and his son (or brother). The *sphaira* (orb) shown in one hand of an emperor was probably only an artistic symbol. It was of Roman origin and signified mundane dominion, but the substitution by Theodosius II (408–50) of a cross for its superimposed imperial eagle demonstrated that this power was only for and through God. The eagle- and, by the 8th century, cross-capped sceptre was a survival of the Roman consular symbol of authority which emperors assumed: it probably existed as a tangible object only at certain periods of Byzantine history and became important mainly in and after the 10th century. The *akakia*, held usually in the emperor's right hand, was a pouch of purple silk containing dust to signify the transience of temporal power. The throne was not only an imperial but also a divine symbol already in pagan antiquity, but in Byzantium, where it was regularly furnished with a foot-stool, it became even more potent through association with the biblical throne of Solomon.

The emperor wore a wide variety of vestments for different stages of different ceremonies, but they were all marked by a chromatic monopoly of imperial purple. At his coronation he usually wore a purple *divetesion* (a long, belted silk tunic, probably later replaced by the somewhat similar *sakkos*), over which was laid during the actual rite a purple *chlamys* (a cloak bordered with gems or pearls) with two attached golden *tablia* (richly embroidered rectangular or trapezoidal pieces). In 14th-century coronations the emperor donned a golden *mandyas* (cloak), probably instead of the *chlamys*. Ornamented red *tzangia* (high boots) became by the 10th century at the latest an imperial symbol and a sufficiently important part of the coronation ceremonial that their use by a subject signalled attempted usurpation of the throne. The *loros*, a stole with a long Byzantine history which was taken to symbolize either the cross or the winding-sheet of Christ, adorned Byzantine emperors on various festive occasions but not at their coronation. It was, however, worn by the Latin Baldwin of Flanders when he was crowned in Hagia Sophia in 1204.

Although a crown was made for the Bavarian Otho, when he accepted the throne of the newly independent Greek state in 1832, there was no actual coronation; and his successor George I did not even possess a crown since there was no constitutional use for one. Nevertheless, the Byzantine coronation ritual, regalia, and vestments survived with only minor changes up to the early 20th century in Russia. Western European coronations have also been indebted to Byzantium, most notably still at the end of the 20th century in Britain. There the crowns of Saxon kings had already been copied from early Byzantine exemplars and the English coronation order was modelled on the Byzantine by the 10th century, while most of the ceremonial and regalia at the coronation of Elizabeth II in 1953 derived from Byzantium, even to the extent of the the *loros* and the *chlamys* or *mandyas* surviving respectively in the Stole Royal and the Robe Royal of Cloth of Gold.

Corruption

The 1997 European Union convention on corruption involving officials of the European Community or of member states (OJ No. C195, 25.6.1997, p. 2) defines corruption as the deliberate, direct, or indirect action of requesting, receiving, or accepting a promise on the one hand (passive corruption), or promising or giving on the other (active corruption) an advantage, to act or refrain from acting in breach of official duties.

This definition, which has been reiterated in the EU joint action on corruption in the private sector (OJ No. L358, 31.12.1998, p.2), reflects the perception of corruption as the occult exchange between the political and administrative and the economic and social market, violating public, legal, and ethical norms and sacrificing the common good to private interest (Della Porta and Meny, 1997). Such a broad definition is necessary in order to embrace the many different aspects of corruption, which are closely interrelated to parallel phenomena of clientelism and maladministration.

In his analysis of the causes of one of the main manifestations of the phenomenon, of political corruption, Paul Heywood (1997) provides a useful overview of the various approaches to the topic. The "structural" approach focuses on the nature of state development, examining variables such as administrative organization, efficiency, and the institutionalization of the political order. The "economic" approach associates political corruption with growing state intervention. And the "institutional" approach focuses on the function and financing of political parties and factors such as longevity in power.

The applicability of these approaches to instances of corruption in the Classical and Byzantine world is limited, due to the differences in the structure of state and polity. The preceding definition of corruption is inextricably associated with the development and specific characteristics of contemporary state organization and social structures. The conceptualization of corruption is considerably different in both Classical and Byzantine times, when characteristic types of political organization led to a broader perception of the term. The Classical period is thus characterized by a series of corruption claims, mostly linked with political disclosure. Corruption was thus a weapon to be used against political opponents, usually as part of a moral crusade aimed at the demonization of the opponent. Similar claims in the Byzantine period were triggered not by the purchase of offices and titles – largely held to be legitimate at the time – but rather by arbitrary administrative actions in the pursuit of profit.

All three approaches have, however, been employed in analyses of political corruption in the modern Greek state. The structural and economic approaches are interrelated in assessing corruption in the development of the Greek polity during the 19th century. Foreign interference and the emergence of a powerful and omnipresent state are viewed as significant factors, related to the immaturity of political institutions and parties, clientelism, and the "oscillation between authoritarian and democratic regimes" (Lyrintzis, 1984). Such articulation of powers in the "procapitalist" Greek society, between weak social and economic forces on the one hand and a very strong state machinery on the other, is critical in strengthening family and clientelistic networks and contributes towards a defensive perception of the role and function of politics, its aims being the protection of the individual from social conflict (Diamantouros, 1983). In this manner clientelistic networks compensate for the absence of strong social classes (Koutsoukis, 1998).

The situation changed with the military coup of 1909, which signalled the end of the 19th-century oligarchic parliamentary system of government (Mouzelis, 1987). The emergence of class interests and their articulation through better-organized political parties gave rise to more centralized forms of "party and state-oriented patronage". According to Mouzelis, the years up to World War II, notwithstanding the increasing significance of ideology, social division, and political conflict, did not witness the eclipse of the patron–client system, but rather the transition from oligarchic/traditional to state/ bureaucratic forms of patronage.

The end of the war and of the Greek Civil War brought about a further turn in the political situation of the country. Emergency legislation, increasing state control in the – in any case – limited exercise of social and political rights, and the proscription of the Communist Party and harassment of its followers made the development of participatory political structures impossible and paved the way for a political system dependent on recourse to patron–client relationships (Gravaris, 1998). Instead of being influenced by local notables, however, clientelism in this period witnessed the pivotal role of the central party leadership in distributing favours. The central role of the state apparatus in the development of clientelistic networks marks further the transition from "party-directed patronage" to a system of "bureaucratic clientelism". This term denotes the infiltration of state institutions by the supporters of the dominant political party, along with phenomena of favouritism, inextricably linked with the expansion of the public sector.

A genuine trend towards bureaucratic clientelism did not appear, however, until after the junta, coinciding with the emergence of well-organized political parties. The persistence of clientelistic phenomena in this period renders the "institu-

tional" approach a useful analytical tool. Notwithstanding the important steps taken towards the consolidation of parliamentary democracy, New Democracy, the conservative party in power between 1974 and 1981, continued to rely on the personal influence and clientelistic networks of its leading members. The socialist government of PASOK on the other hand, in its first period in office from 1981 to 1989, in spite of the elaborate party organization, maintained clientelistic networks due to the overextension of the public sector and the emergence of the state as employer. The new "public ethic" endorsed by the socialist government led Koutsoukis to refer to the appearance of a form of "structural corruption" taking the form of scandals.

The 1990s witnessed an attempt to resolve such complex issues through recourse to the judiciary. The outcome of the corruption trials was of dubious significance for the elimination of the structural roots of corruption in the political system. The economic changes associated with the narrowing of the public sector, along with changes in party organization and perception, may add novel variables to the evolution of the phenomenon in Greece. At the same time, different forms of corruption are highlighted, such as police corruption, public corruption related to organized crime, and corruption in the private sector. In the Corruption Perceptions Index of 1998 issued by Transparency International, Greece holds the bottom position among EU countries after Italy (Transparency International and Göttingen University, 1998).

This and other findings led to an anti-corruption drive by the Greek Supreme Court, modelled on the recent "mani pulite" initiative in Italy (*To Vima*, 4 April 1999, article code B12539A501). At the same time, Greece has introduced a law ratifying the OECD convention on combating bribery of foreign public officials in international business transactions and, as a member of the European Union, implements the EU anti-corruption initiatives. The effectiveness of such legislative and judicial attempts to eliminate the structural roots of corruption remains to be seen.

Corydalleus, Theophilos *c.*1574–1646

Philosopher

Theophilos Corydalleus was the most eminent philosopher of the Greek world after 1453 until the period of the Enlightenment and his influence persisted even down to the 18th century. He was born in Athens where he completed his first studies. Between 1604 and 1608 he was educated at the Greek Catholic College of St Athanasios in Rome. Afterwards he enrolled in the University of Padua to study philosophy and medicine and obtained his doctorate on 5 June 1613. There he met Cesare Cremonini and was influenced by Neoaristotelianism, a predominant philosophical current of the day. Its intention was not to interpret Aristotle as a means of corroborating Christian doctrine, as was the case earlier with medieval Scholasticism and Averroism. Rather it aimed at liberating Aristotle from ecclesiastical control and apologetic objectives and considering his works in their own terms. Such a perspective rendered Neoaristotelians suspicious to Church authorities, because they were thought of as professing non-Christian and even atheistic views.

Despite these shortcomings, Corydalleus's Neoaristotelianism was rather carefully articulated and avoided any serious confrontation with Orthodox doctrine. Aside from his teaching activity in Venice (1608–09), in Athens (1590, 1613–19, 1643–46), in Cephalonia (1619–21), and in Zakynthos (1621–22, 1628–36), Corydalleus was distinguished as director of the Patriarchal Academy in Constantinople (1622–23, 1625–28, 1636–40). He was initially appointed there through the intervention of patriarch Cyril Lukaris. Corydalleus restructured the entire curriculum along the Neoaristotelian model, which contributed to the relative emancipation of philosophy from theology. His teaching was characterized by a methodical, systematic, and clear exposition of his ideas. Corydalleus's impact was long-lasting, for he had many admirers among his students. Some of his works have been republished for didactic purposes. Numerous manuscripts of his writings also survive today in various libraries, a fact attesting to the wider dissemination of his ideas.

Corydalleus was a major scholiast of Aristotle's main works and contributed immensely to the reorientation of the Greek world towards Aristotelian philosophy. Aristotle's authority

thus became established at that time so that he was referred to generally as "the Philosopher". Corydalleus's works, both published and unpublished, contain commentaries on Aristotle's philosophical and scientific texts as well as other writings (see Tsourkas). Corydalleus helped also the development of free thought in the Balkans by liberating Aristotle's interpretation from religious expediencies. To avoid potential conflicts with the Church, he supported the Neoaristotelian doctrine of the "double truth", namely that there existed two separate truths, one based upon the Bible and the Christian doctrine, and the other upon Aristotle. Corydalleus was neither anti-metaphysical nor anti-religious. He adhered to the Christian faith and considered it superior to philosophy. But he also intended to remain faithful to Aristotle, and the doctrine of the "double truth" provided a useful outlet. The latter theory, however, was severely criticized as unfounded and erroneous by other Christian Aristotelians, such as Nikolaos Koursoulas, who tried to prove the full coincidence of Christian and Aristotelian opinions.

Though Corydalleus was ordained as presbyter under the name Theodosios in 1622 and served as archbishop of Arta and Naupactus (1640–42), he was not a truly ecclesiastical man, for his scholarly and didactic activities held priority in his scale of interests. This was probably the reason why he abandoned his priesthood as early as 1625 and later his archbishopric in order to devote himself to his teaching goals. Corydalleus was even met with opposition and criticism from his contemporaries for theological reasons. In some cases, he was suspected and accused of atheism, materialism, and even Calvinism – the last being the accusation brought against patriarch Cyril I Lukaris too.

Corydalleus represented an important moment in the post-Byzantine philosophical tradition of southeastern Europe. His Neoaristotelianism found unexpected fertile ground in the educational tradition of the Orthodox east. This was probably due to the uninterrupted presence of the Aristotelian tradition in the Greek world. Among the consequences of Corydalleus's educational renewal was the relative marginalization of religious and grammatical lessons in school curricula. Corydalleus had numerous students who distinguished themselves at that time, among then patriarch Nektarios of Jerusalem, Ioannis Karyophyllis, Meletios Syrigos, Evgenios Yannoulis, Alexandros Mavrokordatos, and Georgios Sougdouris. Some of them disseminated his philosophical tradition in various parts of the Balkans, such as Germanos Lokros and later Sevastos Kyminitis at the Princely Academy in Bucharest. In this way, Corydalleus's Neoaristotelianism became the most important programme of philosophical education in southeastern Europe in the 17th and 18th centuries. It is no wonder therefore that the libraries of Bucharest and Jassy nowadays house numerous manuscripts containing his works.

In time, however, Corydalleus's influence and authority became so strong and suffocating that they did not allow other systems of thought to develop and flourish. This absolutization of Neoaristotelianism, sanctioned by the Church, became known later as "Corydalism", a term of opprobrium for those who were profoundly attached to and could not look beyond that philosophical system. Whenever Neoaristotelianism was challenged, reactions usually arose both from the teaching staff as well as from the Church. Indicative of such a case was the condemnation of Methodios Anthrakitis in 1723, who had abandoned Aristotelianism and was teaching modern western philosophy. In his reinstatement by the Church in 1725, Anthrakitis was given the order to teach solely Aristotelian philosophy according to Corydalleus's tradition, which was thought to pose no threat to the Orthodox faith. This is evidence of the official sanction of Corydalleus's system by the Orthodox Church, a fact manifested in other cases too (e.g. in the answer of the Eastern Orthodox Patriarchs to the Anglican Nonjurors in 1718). In the first half of the 18th century there were also various debates between Aristotelians (e.g. Dorotheos Lesvios) and non-Aristotelians (e.g. Nikolaos Zerzoulis). The latter tried systematically to undermine Aristotle's authority in ecclesiastical circles by showing the conspicuous and unbridgeable discrepancies between several Aristotelian and Christian views.

The most important challenge for Corydalleus's tradition came from the growing influence of the Enlightenment in the Greek world in the second half of the 18th century, which presented an attractive alternative model of philosophical and scientific tradition beyond Aristotle. As a result, Aristotelian physics as well as Ptolemaic cosmology came under denigrating attack from the proponents of the modern scientific developments in the West. However, Corydalleus still managed to exercise certain influences until the beginning of the 19th century, since his works continued to be taught in several schools. This happened at the Patriarchal Academy of Constantinople too, where Sergios Makraios taught Aristotelian philosophy and science and remained bound to this tradition until his death in 1819. Despite these much later developments, for which he was not responsible, Corydalleus's contributions were of great importance to the development of Greek learning and education in a period of transition from the post-Byzantine era to the age of the Greek Enlightenment.

VASILIOS MAKRIDES

Biography

Born *c.*1574, Corydalleus was educated in Athens, Rome, and Padua where he was influenced by the Neoaristotelianism of Cesare Cremonini. After teaching in Venice, Athens, Cephalonia, and Zakynthos, he was appointed director of the Patriarchal Academy in Constantinople by Patriarch Cyril Lukaris. He also served briefly as archbishop of Arta and Naupactus (1640–42) but resigned to devote himself to teaching. His programme dominated philosophical education in southeastern Europe in the 17th and 18th centuries. He died in 1646.

Cos

Island in the Dodecanese

The island of Cos is the largest of the Dodecanese after Rhodes (although only about one-fifth of its area), and lies close to the coast of Asia Minor; its long, narrow shape, with an area of 282 sq km, extends, at its northeastern end, into the gulf separating the headlands of Halicarnassus (now Bodrum) and Cnidus. It has been known by several names, from the Cos Meropis of Strabo and the Caris of Stephanos of Byzantium to the medieval Lango (referring to its long shape) and the Turkish Istanköy.

The island has two prominent mountain formations, with the two highest points being Oros Dikaios towards the northeast (846 m) and Oros Latra in the southwest (428 m). Most of the rest of the island is quite fertile, with a light, sandy soil, and has always produced much fruit, vegetables, and wine, while its silk was famous in antiquity for its fine texture.

Although populated since earliest times, and later colonized by both Carians from Halicarnassus and by Dorians, the island did not play a part of great importance in Greek history until the mid-4th century BC, with the foundation of the city of Cos. Thereafter it rapidly became one of the main maritime and trading centres of the Aegean, and was later to be the second city of the province of the Islands.

The artist who was perhaps the most famous painter of the ancient world, Apelles, was a native of Cos, and although his renown meant that he worked in many other parts of Greece, Pliny (*Naturalis Historia*, 35. 80) in his account of his life said that he was working at Cos on a painting of *Aphrodite Anadyomene* when "death grew envious of him" and he died with the work unfinished. Also on Cos was a marble statue of *Aphrodite* by the equally famous 4th-century BC sculptor Praxiteles; he had carved two versions, one clothed and one naked, and offered them both for sale at Cnidus; Pliny (*Naturalis Historia*, 36. 20) relates how the people of Cos chose the clothed one, "thinking that this was the sober and proper choice to make".

It was to be the association of the island with Hippocrates, the father of the medical tradition who was born there *c.*460 BC, that lay behind the foundation of the Asclepieum; this was to bring worldwide fame to Cos as a centre of healing. The "Hippocratic oath", named after him, still forms the basis of contemporary medical ethics throughout most of the world, and must be seen as one of the main gifts of the Hellenic world to international medical culture; in revised form it is still actively applied. The Asclepieum was founded after the death of Hippocrates in the mid-4th century BC, and its priests, the Asclepiadai, became known for performing medical cures that followed the teaching of Hippocrates. It developed and prospered over several centuries, eventually reaching the hugely impressive monumental complex that has now been excavated, before major destruction in the 6th century AD. Today it is the island's most visited site.

It may have been the fame of the island in late antiquity that accounts for its importance in early Church history. It was to be one of the three Aegean islands that were represented by bishops at the First Church Council at Nicaea of AD 325 (the other two were Rhodes and Lemnos), and the bishop of Cos, as a suffragan of Rhodes, was present at all major subsequent councils. Several important early Christian basilicas were built on Cos, and those excavated at Hagios Stephanos, Zipari, Mastichari, and in the town of Cos itself all have impressive floor mosaics. During the 11th century the island was attacked by the Arabs, and its position meant that it was sufficiently important to the Byzantines for it to be governed (and defended) directly from Constantinople by appointed officials; in the 12th century members of the imperial family controlled the island. A visitor early in that century, the Russian *higumen* (abbot) Daniil, described it as "large, populous, and rich in cattle".

After 1204 the Deed of Partition allocated Cos to the Latin emperor of Constantinople, but he was never able to exercise control and it was taken over by the Genoese. Around 1225 the navy of the Byzantine government in exile in Nicaea, under John Vatatzes, occupied Cos, incorporating it into the Nicene empire, and after 1261 into that of Byzantium. The hilltop village of Palaiopyli, now deserted, represents well the kind of rural existence that developed during these centuries, with a castle crowning its summit that would have provided shelter for local families.

Cos: view of the Asclepieum founded in the mid-4th century BC

From 1304 until 1947 control over the island was largely lost to the Greek people. It was occupied first by the Genoese, under the Zaccharia family, and then from *c.*1319 by the Turks. They in turn were ousted *c.*1337 by the Hospitallers, who gave the island a period of stability and relative importance that lasted almost two centuries, until they were driven from their home stronghold of Rhodes. The position and size of Cos meant that it was an ideal base from which they could defy, and be seen to defy, the Islamic power such a short distance away across the narrow straits. Besides the large castle of Antimachia that they built inland, the massive fortress that they built overlooking the harbour of Cos was the largest of their fortifications after that of Rhodes, and its latest phases, constructed in the early 16th century, represent the finest achievements of European military building of its day.

When the Hospitallers were forced to leave Rhodes in January 1523, the Turkish power finally completed their occupation of the whole island: they were to remain in control until 1912 when, with the rest of the Dodecanese, Cos was seized by the Italians to ensure that Turkey fulfilled the pledge made that year at the first Treaty of Lausanne. In the Treaty of Sèvres of 1920 the islands were formally made over to Italy, under whom they were to remain, in spite of undertakings to the contrary, until 1947. Only then did Cos formally re-enter Greek tutelage.

PAUL HETHERINGTON

Summary

One of the Dodecanese, the island of Cos lies off the coast of Asia Minor near Bodrum. The city of Cos, founded in the mid-4th century BC, became a major trading centre. It was the birthplace of Apelles and Hippocrates. The Asclepieum became an international medical centre. Cos was occupied by the Hospitaller Knights of St John *c.*1337–1523, by the Turks until 1912, and by the Italians until 1947.

Cosmology

One of the most significant contributions of Greek civilization to the world is the speculative study of the universe. In the 6th century BC the earliest Greek philosophers made the momentous step of viewing the world as a product, not of divine beings exercising supernatural powers, but of natural substances exhibiting natural powers. Why precisely the Greeks of the 6th century made this step is not clear, but modern science can be identified as the legacy of that tradition.

The mythographers of the 8th century BC, Homer and Hesiod, accepted from tradition a world in which a flat circular earth, bounded at its edge by the ocean, lay between a firmament of heaven (Ouranos) above and gloomy underworld (Tartaros) beneath. According to Hesiod, the world arose when Chaos (a yawning gap) was born, followed by the birth of Earth, Heaven, and other cosmic deities. Rejecting such supernatural explanations as this, the philosophers of Miletus gave naturalistic accounts of the world and how it arose. Little is known about the theories of the first philosopher, Thales, except that he is said to have derived all things from water and conceived of earth floating like a raft on a vast sea. His successor, Anaximander, theorized that the earth was a disk with its diameter three times its height, surrounded by circles of fire veiled in mist. The fire shone through holes like spoke-holes on a wheel, appearing as the sun, the moon, and the stars. The world came to be when something productive of hot and cold separated off from the "boundless" matter of the universe. Anaximander's successor, Anaximenes, pictured a flat earth that rode on a cushion of air. The heavens rotated around the earth like a felt cap, surrounded by a boundless expanse of air.

Challenged by criticisms of Parmenides and his followers that what-is cannot arise out of what-is-not, natural philosophers of the 5th century BC emphasized the construction of the world from pre-existent elements. Empedocles envisaged a universe in which a world like ours cyclically alternates with a perfectly homogeneous sphere in which all of the four elements (earth, water, air, fire) have become completely mixed. Anaxagoras posited a world which arose out of an original chaos when a vortex motion separated the elements into distinct layers. The atomists posited an infinite void in which indivisible particles of matter, the atoms, combined and separated to create multiple worlds and their contents. The early philosophers had learned to distinguish between a world-order or world (*kosmos*), of which there might be many, and the universe (*to pan*) which contained one or more ordered worlds and all unordered matter.

The break from mythological thinking was not complete or sudden. The philosophers of Miletus tended to endow the original stuff of the universe–water, "the boundless", or air–with divine qualities and to view it as an autonomous agent. Empedocles and Anaxagoras posited personified forces alongside their elements: Love and Strife (i.e. attraction and repulsion) for Empedocles, a cosmic Mind for Anaxagoras. The atomists finally did away with personified agents altogether, accounting for all changes merely on the basis of the motions of atoms. Early Greek philosophy had arrived at mechanistic explanations of the natural world.

In the 4th century BC the philosophical tradition turned strongly against such approaches to cosmology. Steeped in Socrates' ethical philosophy, Plato criticized natural philosophers for describing how natural phenomena took place while ignoring the fact that the world is organized for the best. To the scientist, mechanical explanations should be preliminary to teleological explanations. In the *Timaeus* Plato sets out to produce a new kind of cosmology based on his principles. Introducing a divine craftsman, the Demiurge, Plato shows how he must have arranged the world for the best, as a copy of an eternal paradigm. The Demiurge forms the earth as a spherical body enclosed in a heavenly sphere pervaded by soul. Outside the cosmos there is nothing. The traditional gods, who are born later, design the human body as the best vehicle for the human soul. Plato explains the motion of the heavenly bodies as circular orbits carried at uniform speeds; apparently irregular motions of the planets are the result of compound motions of several circles.

Although Plato's theory seems unscientific by modern standards, it was important in several ways. First, it allowed for a synthesis of scientific explanation and human values, which seemed to be undermined by materialistic theories of the early philosophers, and hence prepared the way for an acceptance of scientific explanation by popular opinion. Second, it made teleological explanations central to science, allowing for a flourishing of biological sciences. Third, his account allowed for the possibility of developing mathematical models of the heavens, which would lead to a flourishing of astronomy. Fourth, his theory that the earth is spherical was correct, and would henceforth become the standard view on the shape of the earth.

Plato's student Aristotle devoted much effort to working out the details of a cosmos inspired by Plato. Rejecting the hypothesis of a divine craftsman, Aristotle argued that the world was not created, nor would it be destroyed. Rather it exists forever, repeating its meteorological cycles. The four elements are arranged concentrically, with a spherical earth at the centre, surrounded by a shell of water (the seas), a shell of air (the atmosphere), and a shell of fiery matter. Earth and water naturally travel towards the centre of the universe (located at the centre of the earth), air and fire outwards to the periphery. From the region of the moon outwards the heavens consist of a fifth element that some identify with ether, which naturally moves in a circle, but which participates in no other kinds of change. Hence the heavenly bodies are all changeless except for their daily and yearly motions, while all things below the moon are subject to change along with the four elements of which they are composed, which elements are transformed into one another in daily and annual cycles. The heavens are further composed of concentric spheres and the heavenly bodies that move with them. These bodies move in imitation of a first unmoved mover, which we may identify with God, a being that lives the best kind of life by exercising pure mental activity. In Aristotle's world, as in Plato's, everything is arranged for the best; for Aristotle, however, the order is not imposed from without by a craftsman but achieved by natural processes.

Aristotle provided the standard picture of the cosmos for most thinkers in Europe and the Middle East down to the early modern era. The only serious contender was the conception of Epicurus, who revived atomism with a few modifications *c.*300 BC. But because Epicureans apparently clung to the view that the earth was flat at a time when scientific arguments for sphericity had already been given (by Aristotle) and the

circumference of the earth had actually been calculated by scientists to a fair degree of accuracy (e.g. Eratosthenes in the 3rd century BC), Epicurus' theory was in effect obsolete from the time he propounded it. Meanwhile, Plato's conception of the heavenly bodies moving in circles with uniform speed inspired increasingly accurate mathematical models of planetary motions, culminating in the use of epicycles, small circles drawn from a point moving on the orbits of planets. The use of epicycles and other devices allowed astronomers to describe the motions of planets very closely. But the mathematical models produced another problem: no physical theory (Aristotle's was still the most influential) could account for the epicyclic motions of planets. The more accurate mathematical description became, the less satisfactory physical theory proved to be.

In almost all Greek theories of the cosmos, the earth was at the centre. But there were exceptions: Philolaus in the 5th century BC had posited a central fire around which the earth and all other heavenly bodies revolved. In the 3rd century BC, Aristarchus of Samos put forward the correct view that the planets revolve about the sun. His theory, however, never caught on. In the 2nd century AD Ptolemy combined traditional cosmology with the latest methods in mathematical astronomy and fresh observations to produce the most comprehensive astronomical account of the ancient world as well as the best geography of the earth. His treatises subsequently became the standard textbooks for astronomy and geography.

By the 3rd century AD Neoplatonism was becoming dominant among intellectuals. Mixing mysticism with Platonism, Plotinus saw the ultimate reality as an ineffable One from which emanated a cosmic Mind, in which the Platonic Forms found place, from which emanated soul, from which in turn emanated matter. Emanation was not to be understood as generation in time but as a timeless causation from the higher to the lower. The world, then, did not come to be in time, but always was, conforming to the perfect Forms of Mind. Neoplatonic theory did not so much revise the concept of the cosmos as locate it within a hierarchy of beings. About the same time as Neoplatonism became influential, Christianity began to emerge as a leading religion. Church Fathers sought to ground Christian theology in the dominant philosophy of the time, Neoplatonism, but were forced to modify philosophical theories to accommodate their religious doctrines. The world was not everlasting, but created by God, in accordance with the Forms, which were now understood the be in the Mind of God. The heavenly spheres of Aristotle were now understood to be peopled by angels and the Classical cosmos was Christianized. But essentially the cosmos of the Christian Middle Ages, both in the East and West, was Aristotle's cosmos located in a Neoplatonic hierarchy of beings and populated with demons and angels as well as humans, created and ruled by a transcendent God, who could be identified in different contexts with Plato's Demiurge, Aristotle's unmoved mover, and Plotinus' One.

Councils, Ecumenical

Ecumenical (or general) councils are those councils of the Christian Church whose decisions are recognized as binding by the entire Church. The precedent for settling controversies within the Church by means of a council is found in the New Testament (Acts 15). In post-Apostolic times councils continued to be held on a local basis. But the era of truly "ecumenical" councils began with the legal toleration of Christianity in the Roman empire during the 4th century AD. As Christianity became the official religion of the empire, seven ecumenical councils (covering the period from 325 to 787) were called for the purpose of preserving Christian unity within the Roman (and later the Byzantine) empire. These councils were convoked by the Roman emperor and held in cities of the predominantly Greek-speaking Roman east. The Roman empire and its satellites were considered coterminous with the civilized world, the *oikoumene*, whence the term "ecumenical" is derived. The councils produced creeds, or definitions of faith, in response to particular controversies that arose in the life of the Church. In the formulation of these doctrinal statements Greek philosophical terms were redefined to help explain the mysteries of the Christian faith. While only the first seven councils are recognized as ecumenical by the Orthodox and some Protestant Churches, the Roman Catholic Church recognizes 21, the last being Vatican II (1962–65). Two of these later councils dealt with the question of reuniting the

Christian Church after the schism between the Orthodox and Roman Catholic Churches in 1054.

Nicaea I, 325

The emperor Constantine I (324–37) called the first ecumenical council, at Nicaea in 325. The need for a council was precipitated by the teaching of an Alexandrian priest, Arius, who promoted a rigidly monotheistic concept of God. Arius taught that Jesus (the Word) was not God, but was created by him to serve as an intermediary between God and his subsequent creation; there was a time when the Word did not exist. At the incarnation the Word took the place of the rational soul in the person Jesus and became a man. Arius conceded that Jesus was called God, but argued that Jesus was God only by participation in divine grace, not by virtue of his own nature. The question of the nature, essence, or being of God and the relationship between God the Father and God the Son therefore became the point of debate at Nicaea. The council promulgated a statement of faith, the basis of what we now call the Nicene creed. In this statement the Greek term *homoousios* (of the same essence, or substance) was used to describe the relationship between the Father and the Son in the Trinity, thus safeguarding the full divinity of Jesus and his role in the salvation of mankind. The use of *homoousios* in the Nicene creed is evidence of the ongoing redefinition of Greek philosophical terms in a new Christian context. The council also dealt with various disciplinary matters and the administrative structure of the Church. The bishops of the greatest cities of the empire, Rome, Alexandria, and Antioch, were given supervisory powers over other bishops. The bishop of Jerusalem was to be held in honour next to these, because of the city's association with the earthly life of Christ.

Although the Nicene council had produced a creed endorsed by the majority of the bishops and supported by the emperor, the Arian controversy refused to die easily. The recognition of Nicaea as an ecumenical council took another 50 years and the confirmation of its status by the Council of Constantinople in 381. As the example of Nicaea shows, regardless of any declarations of ecumenicity at the outset, the ecumenical status of a council depended most of all on its subsequent recognition and confirmation.

Constantinople I, 381

In 381 the first Council of Constantinople was called by the emperor Theodosius I (379–95) to endorse the theology of Nicaea. Although it was convoked as an eastern regional council, Constantinople was recognized as the second ecumenical council by the Council of Chalcedon in 451. The fathers at Constantinople ratified the faith of Nicaea and further developed its creed. In response to a controversy over the deity of the Holy Spirit, this council confessed belief in the "Holy Spirit, the Lord and Life-giver, Who proceeds from the Father, Who is worshipped and glorified together with the Father and the Son, Who spoke through the prophets". Constantinople defended the Holy Spirit as God, just as Nicaea had defended Jesus as God. Also as at Nicaea, the Council of Constantinople dealt with the administration of the Church. The city of Constantinople had replaced Rome as the capital of the empire in 330. In recognition of its status as the "New Rome", the council decided to honour the bishop of Constantinople as second in rank only to the bishop of Rome. Although no western bishops were present, the Roman Church confirmed the decisions of Constantinople I at the Council of Chalcedon, with the exception of the canon regarding the rank of the bishop of Constantinople. This foreshadowed the growing rivalry between the two sees that eventually led to the schism between the Orthodox and Roman Catholic Churches.

Ephesus, 431

After dealing with the doctrine of the Trinity at Nicaea and Constantinople, theology in the 5th century turned to the question of Christology – in what way was Jesus Christ both God and man? Nestorius, bishop of Constantinople, and Cyril, bishop of Alexandria, were the primary figures in this controversy. Nestorius was trained in the Antiochene theological tradition, which tended to emphasize Jesus' humanity. He declined to call the Virgin Mary *Theotokos* (One who gave birth to God), a term in use since the 2nd century, preferring instead the term *Christotokos*. His reasoning was that while Mary did bear the person of Christ in her womb, she was mother only of his humanity, not his divinity, and so could not properly be called *Theotokos*. Although Nestorius attempted to do justice to both Jesus' humanity and his divinity, his position implied a separation between the two that threatened to make two persons out of Jesus rather than one. Cyril, representing the Alexandrian theological tradition, stressed the unity of Jesus' person (*prosopon/hypostasis*) in the incarnation as expressed in the Gospel of John: "The Word was made flesh" (John 1:14). This controversy was addressed at the Council of Ephesus in 431. Cyril led the attack on Nestorius in the church of the Virgin Mary. Nestorius himself refused to attend the council because Cyril had set himself up as both the prosecutor and the presiding judge. Not surprisingly, Cyril triumphed and Nestorius' position was condemned. A countercouncil was held by John, bishop of Antioch, in support of Nestorius; in the end, both sides appealed to imperial intervention. An agreement was reached whereby Nestorius resigned his see and was sent back to his monastery in Antioch, while Cyril and John worked out a compromise formula of union. The statement endorsed the term *Theotokos* and acknowledged Jesus Christ as "perfect God and perfect man ... For of two natures a union has been made. For this cause we confess one Christ, one Son, one Lord". The Council of Ephesus provoked the first lasting schism in the Christian Church – Nestorianism spread among the Christians of the Persian empire and survives today among the Assyrians of northern Iraq.

Chalcedon, 451

The declaration of the unity of Jesus' person at the Council of Ephesus provoked a strong reaction against any hint of Nestorianism. Eutyches, a monk in Constantinople, took Cyril's theology to an extreme. Eutyches taught that before the incarnation Jesus was of two natures, but afterwards only of one, in which the divine nature in effect swallowed up the human one. This "one-nature" theology is the origin of the term Monophysite (*physis* = nature) that is used to describe the

theology of Eutyches and his sympathizers, which included Dioscurus, bishop of Alexandria. At issue were the use of the Greek terms *physis*, *hypostasis*, and *prosopon*, to explain the humanity and divinity of Jesus. For Eutyches and the Alexandrians, these terms were essentially synonymous – to be one person Jesus had to have one nature. Those who professed two natures seemed to fall into the error of the Nestorians, dividing the person of Jesus. Another council was held at Ephesus in 449, which supported the Alexandrian position. But the decisions of this council were overturned by the Council of Chalcedon in 451. Here an attempt was made to be true to Cyril's Christology while maintaining the reality of both Jesus' divinity and his humanity. This council accepted the explanation articulated by Leo, bishop of Rome, in his *Tome*: Jesus was "to be acknowledged in two natures ... in one person, and in one hypostasis". Unfortunately, this formula did not satisfy the Alexandrians, who while rejecting the heresy of Eutyches preferred to retain Cyrillian terminology. Thus began the schism between the Monophysites and the Orthodox Catholics. The Monophysite (also known as the non-Chalcedonian or Oriental Orthodox) Churches exist to this day, among the Coptic Egyptians, Ethiopians, Jacobite Syrians, Armenians, and Malankar Indians. Currently, ongoing theological discussions between Oriental Orthodox and Eastern Orthodox hierarchs have affirmed that the separation between the two Churches is one of terminology rather than theology, and they hope to achieve full communion in the near future.

The assembly at Chalcedon ratified the decisions of Nicaea I, Constantinople I, and Ephesus, thereby recognizing them as the first three ecumenical councils. The council also solidified the structure of Church government by granting the bishops of Rome, Constantinople, Alexandria, Antioch, and Jerusalem the title of "patriarch" and jurisdiction over all churches in their territories.

Constantinople II, 553

The Council of Constantinople II, held in 553, was an effort to reconcile with the Monophysites. Justinian I (527–65), like other Roman emperors before him, was interested in maintaining religious unity among his subjects. The council condemned the so-called Three Chapters – the writings of three theologians, Theodore of Mopsuestia, Theodoret of Cyrus, and Ibas of Edessa, whose work was considered by the Monophysites to be Nestorian. The council also tried to answer Monophysite objections to the definition of Chalcedon by explaining more concretely how two natures unite as one person in Jesus Christ: "For in saying that the only-begotten Word was united by hypostasis [personally] we do not mean that there was a mutual confusion of natures, but rather we understand that the Word was united to the flesh, each [nature] remaining what it was." The Council of Constantinople II also condemned the teachings of the 3rd-century theologian Origen, whose philosophical speculations were popular among certain eastern monks. Despite the efforts of the council and the emperor, the Monophysites were not reconciled and remained in schism.

Constantinople III, 680–81

The sixth ecumenical council, Constantinople III (680–81), condemned the Monothelite heresy. Monothelitism was a doctrine that proposed that while Jesus had two natures, he had only one will, the divine predominating. This formula, promoted by the emperor Herakleios (610–41), was yet another attempt to reconcile with the Monophysites. The Church as a whole rejected the doctrine of the "one will" as contrary to the faith as defined by the previous ecumenical councils – if Jesus had two natures, he must have two wills, both divine and human. With this affirmation, the council provoked another schism – the Maronites, a group of Syrian Christians, would not renounce Monothelitism. The Maronite Church later joined in communion with the Roman Catholics in 1182, and they exist today as an Eastern-rite Catholic community.

Nicaea II, 787

The seventh ecumenical council was called in response to the iconoclast controversy. Emperor Leo III (717–41) began an attack on the Christian practice of venerating icons, pictorial representations of Jesus and the saints. Apparently, he believed that God was angry with the Christians for their "idolatry" and was punishing them. This was at a time of natural disasters and the loss of imperial territory, especially to the Muslims, who abhorred the use of religious images. Iconoclasm was primarily an imperial heresy, in that it was imposed by the emperors on the Church. It was enforced in two stages, from about the years 726 to 780, and then again from 815 to 843. The first restoration of the icons occurred under the empress Irene (797–802, regent from 780), who convoked the second Council of Nicaea in 787. This council rejected the ecumenical claims of the iconoclastic Council of Hieria (753), and set forth the theological argument in favour of the veneration of icons. It made it clear that icons are useful in teaching the faithful and that the images are venerated or honoured, not worshipped, as worship properly belongs to God alone. The honour due to the icon is bestowed upon the person it represents, not the material out of which the icon is made. Most importantly, icons of Jesus expressed the truth of the incarnation. In the words of John of Damascus: "Of old God the incorporeal and uncircumscribed was not depicted at all. But now that God has appeared in the flesh and lived among men, I make an image of the God who can be seen." After a return to iconoclasm under a series of emperors in the 9th century, another empress, Theodora, presided over the final restoration of icons in 843. This event is commemorated in the Orthodox Church as the "Triumph of Orthodoxy", celebrated on the first Sunday in Lent. This liturgy affirms the faith of the seven ecumenical councils.

After Nicaea II the western Church, under the leadership of the pope of Rome, and the eastern Church, under the patriarch of Constantinople, grew increasingly apart, culminating in a schism that is conventionally dated to the year 1054. After this date one may speak of separate Roman Catholic and Eastern Orthodox Churches. The Roman Church continued to recognize its own councils after the schism as ecumenical; two of the most notable were the council of Lyons II (1274) and Ferrara-Florence (1438–39). These councils attempted to heal the

schism between the two Churches, but because they enforced the Roman tradition over the Constantinopolitan, the East found it difficult to agree to any lasting reunion.

Crates of Mallus

Stoic philosopher and literary critic of the 2nd century BC

Mallus in Cilicia, in southeast Asia Minor, lay in an area that was an important centre of Stoic studies from the 3rd century BC until at least the 2nd century AD. Exactly when Crates, son of Timocrates, was born there is unclear; however, we learn from the *Suda* that he was a contemporary of Aristarchus of Samothrace (*c.*216–144 BC), from Strabo that he was also a contemporary of Demetrius of Scepsis (born *c.*214 BC), and from Suetonius that he was sent from Pergamum to Rome on a diplomatic mission at about the time of the death of Ennius (169 BC). All of this suggests that he moved to Pergamum at the time of Eumenes II (197–158 BC), the most culturally ambitious and the most tireless promoter of scholarship and the arts of all the Attalid dynasty. Crates had followers (we hear of "Cratetians"), but these may simply have been students in the Stoic tradition (the most distinguished was Panaetius) rather than members of a "school" deliberately established in Pergamum to oppose the scholarship produced in the Museum and Library at Alexandria.

Crates is much quoted in scholia, lexica, and collections of "opinions" generally (in Mette's two volumes (1936, 1952) there are 18 items of "testimonia" and 86 "fragments" – rather more voluminous than what is meant by this term in other collections – covering a total of 313 pages of printed text; see also Mette's indexes of sources). Of his works on literature only two titles appear reasonably certain: the first (*?Diorthotica*) seems to have been a commentary with textual criticism of the *Iliad* and *Odyssey* in nine books, while the second (*Homerica*) may have dealt with problems of geography and even cosmology. We have, however, no idea of the total range of Crates' writings on literary topics: there may have been many other works, since we have "fragments" citing his opinions on Hesiod, on Alcman, on Euripides, and on Aratus, for example; but these may simply be obiter dicta to his works on Homer.

What seems fairly certain, however, is that Crates' approach to literary studies was primarily Stoic and this determined the type of scholarship that he produced. Cicero tells us that Chrysippus, another native of Cilicia, the third head of the Stoa and the person who, in his voluminous writings, gave the definitive statement of the principal Stoic doctrines, had "wanted to harmonize [*accommodare*] the myths in Orpheus, Musaeus, Hesiod, and Homer with his own views ... about the immortal gods, so that even the earliest poets, who had not the slightest idea about these views, would appear to have been Stoics" (*De Natura Deorum*, 1. 41). Given this manner of proceeding, it became possible for a literary critic of the Stoic persuasion to elucidate the "true" meaning that lay behind the words of an early poet, as Crates did for Homer most spectacularly (and bizarrely) when he interpreted the shield of Agamemnon (*Iliad*, 11. 32–40) as a representation of the cosmos and the shield's ten circles of bronze (line 33) as standing for the ten cosmic spheres and so on, with every detail "explained" by means of allegory (Eustathios on *Iliad*, 11. 32–40 = Mette, 1936, fr. 23a; Mette also argued for the same interpretation by Crates of the shield of Achilles, famously described at *Iliad*, 18. 463–608: cf. Mette, 1936, pp. 36–42). Likewise, a person with a good understanding of Stoic doctrines (the "truth") could see where the essential message had been corrupted, either because the poet had failed to apprehend it correctly or because errors had crept into the manuscript tradition: in either case the text could now be properly emended. This somewhat circular reasoning does not explain every emendation of Homer proposed by Crates, but it does go some way towards accounting for the remarkable freedom with which he, and other scholars, expounded the text.

Crates' great rival among literary critics was Aristarchus of Samothrace, who became chief librarian in Alexandria around 153 BC. Their differing approaches to a problem are well exemplified in a lengthy passage in the *Geography* of Strabo (1. 2. 24–28), where they are described as "the leading figures in this field of knowledge [sc. literary criticism]"; where Aristarchus is replying to an emendation of *Odyssey*, 1. 24 and a hypothesis of Crates about the Ethiopians; where Strabo dismisses the arguments of both as wrong (because, in his view, each has misunderstood what Homer is saying); and where Aristarchus, whose reading is the one found in standard texts today, is described as "also indulging in a petty and pointless discussion of the text"! Overall, one has the impression not so much of a clash of "schools" but of a personal rivalry between leading scholars, such as is still found today: they do, of course, agree on some things but disagree about much more.

Neither Crates nor Aristarchus was in any sense a narrow specialist and the passage just cited shows their interest in cosmology and geography. In Crates' case this led to what seems to have been a major innovation: according to Strabo (2. 5. 10), since the known, inhabited part of the world (that is, Eurasia and the northern portion of Africa) occupies but a small part of the total land mass of the globe, anyone who wishes to represent it accurately must make a large globe of the world (no less than 10 feet in diameter) "just like that of Crates".

There is another area, the study of the formal structure of language, where Crates and Aristarchus are contrasted in our sources. In Alexandria principles of regularity in the declension of nouns had been analysed and described, and to this principle the term *analogia* had been applied; by contrast, the Stoic Chrysippus had argued that words and the things they described frequently did not stand in any sort of harmonious relationship, and this situation he called *anomalia*, writing four books on the subject. By the time of Crates this area of study was being called *grammatike* (sc. *techne*), and Aulus Gellius tells us that "two distinguished Greek *grammatici*, Aristarchus and Crates, made a habit of defending with the utmost vigour, the former analogy, and the latter anomaly" (*Noctes Atticae*, 2. 25. 4). Obviously both ideas can be observed in declensions and conjugations; moreover, it was the Stoics in Crates' day who made the greatest contributions to the study of *grammatike*. It should, however, also be noted that Crates preferred to call himself *kritikos* (a critic), regarding criticism as "a master-science of language, comprising grammar, linguistics, and literary criticism" (Asmis 1992, p.139).

Finally, in his work *On Grammarians* Suetonius states that in his view, it was Crates of Mallus who introduced the study of grammar to Rome: during his embassy from Pergamum he had the misfortune to fall into a sewer opening and broke his leg, so that the public lectures and seminars that he had already been giving were continued into the period of his convalescence (*De Grammaticis*, 2). It is highly unlikely that Crates could have discussed grammar without at least some mention of basic Stoic ideas; accordingly, it may not be unreasonable to see in Crates one of those Greek philosophers who presented Stoicism, possibly in a somewhat simplified form, in Rome in a manner both accessible to, and welcome among, upper-class Romans – with enormous consequences for Roman conduct in the future.

In the 20th century our knowledge of Crates' activities and importance has been greatly enhanced by the work of H.J. Mette; some of his theories, however, especially the connection posited between the close scrutiny of anomaly and the ideas of the "empirical" school of medicine, remain controversial. More recently, E. Asmis, in an important and carefully argued paper analysing the discussion of Crates in book 5 of Philodemus' *On Poems*, has attempted to reconstruct Crates' theory of poetry; in addition, and more surprisingly, she concludes that he was not a Stoic philosopher, but as a "critic" simply adopted some Stoic principles and rejected others (p.161).

CHARLES L. MURISON

Biography

Born at Mallus in southeast Asia Minor *c.*215 BC, Crates seems to have moved to Pergamum from where he was sent on a mission to Rome in 169 BC. As a literary scholar he worked mostly on Homer and was the rival of Aristarchus of Samothrace. Suetonius says that he introduced the study of grammar to Rome. He took his linguistic principles from Stoic philosophy. His date and place of death are unknown.

Crete

Aegean island

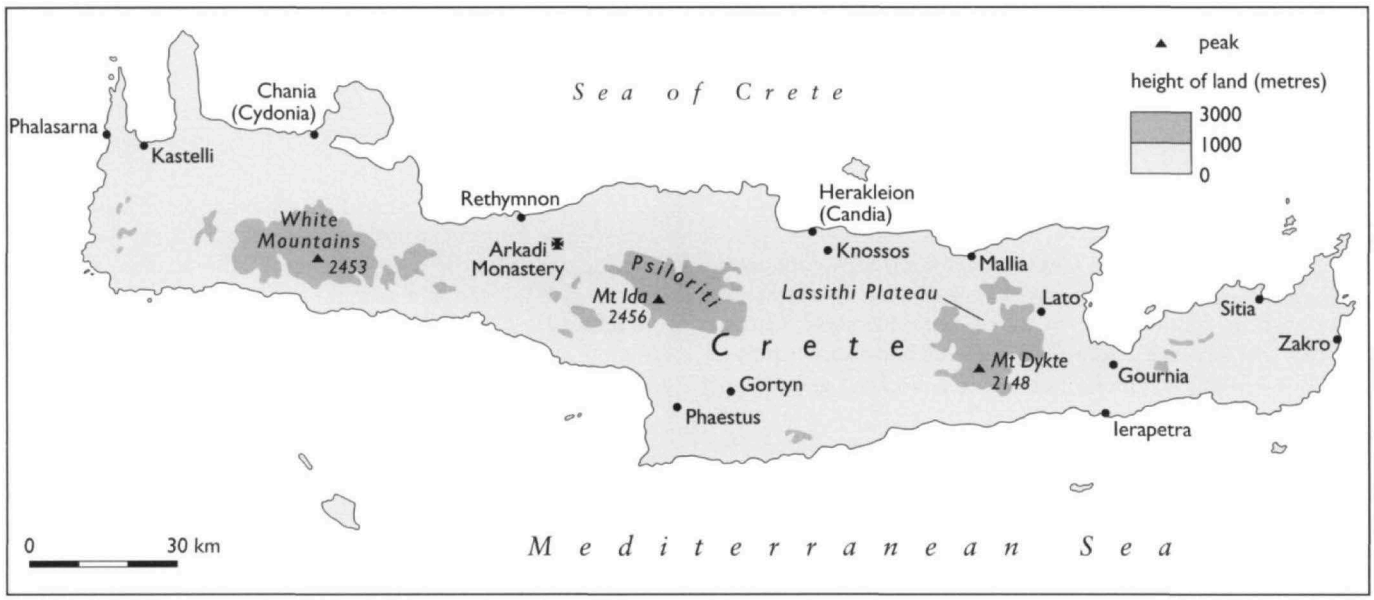
"Out in the dark blue sea lies a land called Crete, rich and lovely land, washed by the waves on every side, densely peopled and boasting ninety cities. Each of the several races of the isle has its own language. First there are the Achaeans; then the genuine Cretans, proud of their native stock; next the Cydonians; the Dorians with their three clans; and finally the noble Pelasgians. One of the ninety towns is a great city called Knossos, and there, for nine years, King Minos ruled, and enjoyed the friendship of almighty Zeus" (*Odyssey*, 19. 172ff., translated by E.V. Rieu). Thus Odysseus described this Aegean island which has often played an important and intriguing role in the history of the Hellenic world, especially in pre- and protohistoric times – a pre-eminence which may be partly reflected in the fact that Crete is the home of many famous Greek myths and legends, from the story of Zeus' birth in one of the island's numerous caves to Theseus' slaying of the Minotaur, Minos' stepson, a creature half man and half bull, the offspring of the union between the king's unfaithful wife, Pasiphae, and a handsome bull.

Crete is the largest Aegean island. It is approximately 250 km long and its width ranges from 58 km at its widest point, across the Psiloriti massif, to 12.5 km at its narrowest, across the isthmus of Ierapetra; it lies across the southern Aegean basin, between the southeast tip of the Peloponnese and the island of Cythera (to the west) and the Dodecanesian islands of Kasos, Karpathos, Rhodes, and the southwest coast of Turkey (to the east); the Libyan Sea separates it from the north coast of Africa (about 300 km to the south) while the Aegean Sea and the Cyclades lie to the north.

Crete is now divided into four "nomes" or prefectures grouped around the main urban centres of Herakleion, Chania (ancient Kydonia), Rethymnon, and Sitia. About 20 per cent of the present population (a little over 500,000) reside in Herakleion.

The wild, rugged, and varied landscape is largely dominated by chains of limestone mountains forming the island's backbone. The main ranges are the White Mountains (2453 m) in the west, Psiloriti or Mount Ida (2456 m) in the centre, and Lassithi or Mount Dykte (2148 m) in the centre-east. The smaller Sitia mountains lie at the eastern end of the island, beyond the isthmus of Ierapetra, and the Asterousia Mountains are situated in the centre-south, between the Mesara plain and the Libyan Sea.

Crete's main mountains slope more gently towards the north coast, where there are several small coastal plains, but the largest piece of flat land is the Mesara, in the centre of the island, on the south coast. A characteristic feature are the small



14. Crete

high upland plains, of which the best known are the Lassithi plateau, Nida (on Psiloriti), and Omalos (in the White Mountains), from which starts Samaria, the longest (17 km) and most spectacular of many gorges scarring the Cretan landscape.

There are few rivers, often reduced to little more than a trickle in the summer, such as the Kairatos near Herakleion, and the Ieropotamos in the Mesara, which is believed to have been partly navigable in antiquity. There is also one small freshwater lake, Kournas, a short distance inland from the north coast between the modern towns of Rethymnon and Chania.

Crete has been renowned since antiquity for its wild plants and flowers, of which over 100 are exclusive to the island. Among the fauna it is worth mentioning the wild goat (*agrimi* or *kri-kri*), often depicted in Minoan art and still surviving in the wild.

Crete is most famous for its long-lived Bronze Age civilization, called Minoan after the mythical king Minos, but the whole of the island's history is equally intriguing, as varied and rough as the landscape.

The earliest traces of human habitation go back to the Neolithic period (*c.* 7000–3500 BC). The first inhabitants were probably a small group of farmers from Anatolia, who crossed the Aegean Sea and settled at Knossos, sometime before the end of the 8th millennium BC. In the following millennia their first settlement expanded, more or less steadily, and from there groups of settlers spread to the rest of the island.

Knossos, the first as well as the largest Neolithic settlement on Crete, maintained its pre-eminence also during the following Bronze Age (*c.*3500–1100 BC), which saw the emergence and demise of the Minoan civilization. What language (or languages) the Minoans spoke is unknown, for their surviving documents were written in two scripts, known as Cretan Hieroglyphic (or Pictographic) and Linear A, which, so far, have not been convincingly deciphered: all one can say is that these scripts do not represent a form of Greek. (Indeed, a non-Greek language continued to be spoken in the east of Crete as late as the 3rd century BC, as shown by surviving inscriptions found at Praisos). The Minoans, however, had a significant and lasting influence on the population of the other Aegean islands and on the Greek-speaking population of mainland Greece, the Mycenaeans, before eventually succumbing to their power.

When exactly the Mycenaeans gained political supremacy in Crete is still a matter of debate, but most scholars believe that this may have happened towards the end of the Late Minoan IB period, that is around 1450 BC (low chronology) or 1550 BC (high chronology). That at some point during the second half of the 2nd millennium BC Mycenaean Greeks gained control in Crete is demonstrated by the Linear B tablets found by Sir Arthur Evans at Knossos at the beginning of the 20th century. Linear B, which is a development of Linear A, was deciphered as Greek by the British architect Michael Ventris in 1952.

Crete continued to flourish until the collapse of the Mycenaean palaces on mainland Greece (*c.*1200 BC), which heralded a period of insecurity and movements of people throughout the Aegean. In Crete this is indicated by the emergence, in the 12th century BC, of settlements on naturally defended high ground, such as Kastri, Vrokastro, and Karphi. The following period, the Early Iron Age (Geometric and Orientalizing periods, *c.*1100–700 BC) witnessed the gradual infiltration of a Dorian population as well as the emergence of the polis or Greek city state. The Dorians eventually came to dominate the island, building substantial cities, such as Lato and Dreros, often at war with each other. Throughout these changes, several Minoan cult places – such as the sanctuary at Syme, and the sacred Dyktean and Idean caves – continued to function as places of worship. Some of the finds from the Idean cave, namely the famous votive bronze shields with figurative relief, together with lively local pottery production, show that the island was one of the earliest centres in the Hellenic world to adopt the new orientalizing fashion. Crete is also the likely home of the Daidalic style of sculpture which had an important influence in the artistic development of the Archaic period throughout Greece.

In the Classical period Crete seems to have been relatively untouched by the momentous events occurring on the mainland and in the rest of the Aegean. Plato, however, admired Crete's ordered and conservative society, of which the famous inscription of the laws of Gortyn (dating from the first half of the 5th century BC) offers some picture; the Cretans also enjoyed a certain reputation in the Greek world at least as pirates and mercenary archers.

In the Hellenistic period Crete's advantageous position over sea routes brought new prosperity, despite the constant state of petty warfare among its city states, with Knossos, Lyttos, Gortyn, and Kydonia as the main contenders for supremacy.

Rome, after its conquest of mainland Greece in the mid-2nd century BC, became increasingly involved in Cretan affairs. In 68–66 BC Quintus Caecilius Metellus (who later gained the name of Creticus) led a successful expedition to conquer the island. Under Roman rule (67 BC–AD 330) the town of Gortyn became the capital of a province which also included Cyrenaica in north Africa. To judge from the abundance and type of settlements (e.g. isolated farmsteads reappeared for the first time since the Minoan age), this was one of the most prosperous periods for the island. Titus was sent by St Paul to spread Christianity, and he eventually became the island's patron saint.

The triumph of Christianity and the foundation of Constantinople in AD 330 mark the beginning of the early Byzantine era. In the division of the Roman empire in AD 395 Crete, naturally, was included in the eastern part and for centuries shared its fortunes. The island's wealth and stability during the early Byzantine period are reflected in the remains and sites of about 70 Christian basilicas, most dating from the mid-5th to mid-6th centuries AD. The most impressive example is that of Hagios Titos at Gortyn, while that of Vizari, in the Amari valley, is notable for it dates in the late 8th century, that is shortly before the Arab conquest of the island.

Crete had already been attacked by Arab raiders in 673 and 715, and in 824 fell into the hands of a group of Arab marauders based in Alexandria, but originally from Spain. Led by Abu-Hafs-Omar, they set up a fortified camp on the site of modern Herakleion, and surrounded it with a huge ditch – in Arabic el-Khandak, from which the name of Candia, frequently applied to both the town and the island until this century – was derived. Arab rule (824–961) lasted well over a century, but little has been recovered from this period.

Crete was recaptured by the Byzantine general Nikephoros Phokas in 961 and remained in Greek hands until 1204, when the Venetians gained control of the island, after negotiations following the Latin sack of Constantinople, and a brief war with rival Genoese forces. During the middle Byzantine period several basilicas were rebuilt and the Christian ruling class, the Archontopouli (Sons of Nobles), was drawn from 12 aristocratic families sent out from Constantinople.

Venetian administration (1204–1669) left many traces on the island, such as the impressive fortresses at Herakleion and Rethymnon as well as several other fine buildings. The Venetians, however, were unpopular masters, and their rule was punctuated by rebellions. The most serious was in 1363, when the Cretans declared the short-lived republic of St Titus. Throughout the period of Venetian rule, the Greek population maintained its links with Constantinople through language and religion, for the Venetians left the Orthodox Church virtually untouched. The Cretan Archontopouli remained strong and continued to build their own small churches and chapels. A fine example of 13th- and 14th-century wall painting survives in the church of Panagia Kera near the village of Kritsa.

With the Turkish capture of Constantinople in 1453, Crete became an important asylum and staging post for Greeks fleeing to the west. This brought new vitality to the cultural life of the island, creating a sort of Cretan Byzantine renaissance: monasteries such as Arkadi, Gonia, and Angarathos became notable centres of manuscript copying and learning, with Hagia Aikaterini in Herakleion gaining particular distinction in the 16th century.

This renewed intellectual atmosphere also produced interesting paintings, exemplified in the works of Mikhail Damaskinos and Domenikos Theotokopoulos (El Greco) as well as some literary efforts, of which the most notable is Vintsentzos Kornaros's long poem, the *Erotokritos* (probably written in the mid-17th century, but published in Venice in 1715).

Crete eventually succumbed to the Turks in 1669, when Candia (Herakleion) capitulated after a siege of over 20 years. Like their Venetian predecessors, the Turks were detested masters, and their period of rule (1669–1898) was marked by several insurrections, such as those of 1866, which ended with the blowing up of the Arkadi monastery, and of 1878, which inspired the powerful novel *Freedom and Death* by Nikos Kazantzakis (1883–1957), one of Crete's best-known writers. Further violent uprisings eventually forced the great powers to intervene, and in 1898 Crete was granted autonomous status under nominal Ottoman suzerainty, with prince George, the heir to the Greek throne, appointed as High Commissioner. Union with Greece seemed very close, but the island became part of the Greek state only in 1913, a few years after an ambitious lawyer from Chania, Eleftherios Venizelos, became Greece's Prime Minister.

During World War II, in 1941, Crete was invaded and briefly occupied by Germany, before being liberated by the Allied forces – the island's wild mountains and the fiery independent character of its inhabitants once again playing an important part in the organization of the resistance.

Today Crete is one of the most prosperous regions of Greece, thanks to greatly improved – and largely EU-subsidized – agriculture and tourism. Since the 1980s, however, this prosperity has also brought a massive amount of hideous building, which has ruined large tracts of land, especially on the north coast.

Summary

The largest Aegean island, Crete is best known for its Minoan civilization which flourished during the Bronze Age until overtaken by Mycenaeans *c.*1500–1200 BC. A backwater in the Classical period, Crete prospered again in the Hellenistic and Roman periods and was an early centre of Christianity. Held by Arabs from 824 to 961, then Byzantine again until 1204, it was a Venetian possession until 1669

enjoying a cultural flowering after 1453. After 230 years of Turkish rule Crete gained autonomy in 1898 and was united with Greece in 1913.

Crimea

The Crimea is a lozenge-shaped peninsula roughly 250 × 150 km in size on the northern Black Sea. Successively known as the Tauric Chersonese, Gothia, and Khazaria, it served as the historic interface between the western Greek and northern "barbarian" worlds, represented in turn by Scythians and Mongols. As a sort of ethnic sump, the Crimea long retained communities of invaders, traders, and refugees who passed through: for example, it was a "Little Armenia" in the late Middle Ages, while fundamentalist Karaite Jews outlasted the last metropolitan of Gothia, who died in 1786. Even today the Crim-Tatars, who arrived in the 13th century, are making a notable come-back, only to find their home is in the Ukraine but full of Russians. Of all the Crimea's peoples, the Greeks have been, until recently, the most persistent.

Despite such ethnic diversity, the Crimean interface is marked precisely by geography and economy. A sharp mountain range, topped by high summer pastures, runs along the southeastern coast from Cherson (ancient Chersonesus), near modern Sebastopol, to Pantikapaion, near modern Kerch, on the Cimmerian Bosporus at the entrance to the Maiotic Sea of Azov. The mountains hem the sea to a coastal strip which with its high rainfall, viticulture, and fish pans attracted colonists from the south and west to trading and listening posts. Behind the mountains most of the Crimea is steppe: grazing land when in the hands of Scythian, Pecheneg, or Tatar pastoralists, but at other times rich enough to become in turn a granary of ancient Athens (reflected in Euripides' play *Iphigeneia in Tauris*, which puts the near-sacrifice of her brother Orestes at Fiolente near a place of commercial importance); a granary of Genoa from the 1270s to the closing of the Black Sea by the Ottomans in 1475 (when the Genoese colonial capital was at Caffa [Theodosia, Feodosiya which in the 1340s also exported both slaves and

the Black Death to the west); and finally in the 19th century when, just before the Crimean War, its grain won a gold medal in London at the Great Exhibition of 1851.

The Greek sequence begins with the meeting of Carian adventurers with Tauric Scythians long before the establishment of an Ionian colony at Cherson in the 6th century BC. As a self-consciously Greek entrepot and grain exporter, Cherson was especially prosperous in the Hellenistic, Roman, and early Byzantine periods and remained a pivotal and sometimes semi-autonomous place thereafter, depending on the relative influence of Constantinople and Bosporan, Khazar, and other powers. Pope Martin I (d. 655) and Emperor Justinian II (d.711) were exiled there, and after it became a 9th-century Byzantine theme, it played an essential part in the evangelization of Kievan Russia: by tradition Prince Vladimir I was baptized in Cherson in 988/9.

After 1204 centres of importance moved east. The Grand Komnenoi of Trebizond claimed the Byzantine inheritance in the Crimea in theory and were closely related to the Greek princes of Sts Theodores (Mangup) in practice, reviving the political links that were first established between the Crimea and the Pontus when Mithridates VI, king of Pontus, died old and in despair at Pantikapaeum in 63 BC. Italian merchants and missionaries revived most of the ancient Greek commercial colonies of the coast and traded with the Golden Horde, the last of the sequence of steppe powers. This period came to an end in 1475 when the Ottomans concluded their conquests of Constantinople (1453) and Trebizond (1461) by taking Caffa and Mangup and making tributary the Giray khans of Crim-Tatary, who governed from north of the mountain divide at Bahchesaray, near the Karaite centre at Chufut Kale and not far from Mangup. The Armenians moved on up the Danube.

After the Russian conquest of the Crimea from 1783 under Catherine the Great, ancient Greek colonies, Italian trading posts, and Tatar fishing villages entered a new lease of life: for example, Symbolon (Italian Cembalo) is today better known as Balaclava, Kalamita as Inkerman, and Yalita (Tatar Dzalita) as Yalta, a resort twinned with Margate in England, which has today resumed more ancient commercial ties with Sinope (Turkish Sinop). After 1783 Pontic Greeks began a further migration north to the new towns of Odessa, Mariupol, and Rostov. But in the Crimea excavations of the vast Classical sites, of Cherson and Pantikapaeum especially, begun in the 19th century, continue to yield evidence of a continuity of settlement and economy. Genoese Caffa awaits further serious investigation.

ANTHONY A.M. BRYER

Summary

First colonized by Greeks in the Archaic period when it was known as the Tauric Chersonese, the Crimea was important chiefly as a source of grain. It was especially prosperous in the Hellenistic, Roman, and Byzantine periods. Italian merchants moved in from 1204 to 1475 when it fell to the Ottomans. Greek contact was revived after the Russian conquest in 1783.

Croatia

Today an independent South Slav state in the northwestern Balkans, Croatia emerged from the disintegration of Titoist Yugoslavia, within which it had constituted a federal republic until 1991. Croatia is properly regarded as the region that follows the state borders with Slovenia, Hungary, and Bosnia, is blocked off from the Adriatic coast by the mountains of Velika and Mala Kapela (Gvozd), and fuses to the southeast with the adjacent Slavonia – the region between the Drava and Sava rivers – into one natural but not always historical entity. Historically, from the 13th century onwards, the lands of Croatia proper were called Slavonia, while the name Croatia (and Dalmatia) designated the littoral region between the Gvozd mountains and the Adriatic.

In Roman times the region corresponded roughly to the lowlands of the province of Pannonia below the Drava river, which was named after its ancient inhabitants, the Paeones, a heterogenous Illyrian-Celtic tribe who succumbed to the Romans at the time of Octavian, in 35 BC. There emerged in time one of the two medieval Croatian principalities, namely Pannonian (Great or White) Croatia, after Croat settlers massively infiltrated this pagan area around the Drava and Sava rivers (Pannonia Savia) in the 6th and 7th centuries during the South Slavic migrations. In fact, Croatian infiltration and eventual establishment in the northwestern Balkan borderlands of Byzantium are believed to have been encouraged by the emperor Herakleios (610–41) who sought to use the Croats to contain Avar incursions. Because of the Slavonic descent of the settlers the region was to be called Slovinje and later Slavonia. Another branch of Croats was directed to and populated the Adriatic littoral, the so-called Coastal or Dalmatian Croatia extending along the seaboard from the Raša to the Cetina rivers. Its core area was the triangle formed by the towns of Šibenik, Nin, and Knin, where there gradually evolved a matrix Croatian state which, in the 10th century, was to unify the two principalities into a strong and expanded Croatian kingdom.

Like Dalmatia, Croatia proper occupied a position that formed a channel for both communication and confrontation between peoples and cultures, a factor of major significance for Croatian history. Situated astride the route to and from central Europe, and at the same time a natural continuation of the wide Pannonian plain, Croatia formed a part of a broader geopolitical entity. This exposed the Croats to foreign influences, and in particular directed their orientation towards the Roman/western sphere of culture; but it also left them vulnerable to the multifarious rivalries that developed in the Pannonian basin, and this explains why the Croats experienced difficulty in attaining lasting national statehood.

Initially allotted to the western half of the Roman empire, the lands later inhabited by the Croats were transferred to Constantinople following the collapse of the West in 476 in the wake of the Germanic invasions. Nevertheless, both the inland regions and the coastal Roman towns remained culturally attached to Rome. This cultural tradition proved sufficiently resilient to survive latently the disruption of Illyrian-Roman civilization brought about by the South Slavic colonization. In the Dalmatian towns, in particular, there still lived a large number of Romanized Illyrians who were vehicles of Latin

culture. Centuries later this heritage would prove an asset to Rome in preserving the universality of Latin Christianity in the Croatian lands in opposition to the Byzantine cultural influence promoted through the Slavic script and liturgy.

The first two centuries of the Croats' history after they settled in the Drava-Sava area are obscure – apparently a transitional period in which their social organization must have remained sketchy. At the end of the 8th century Charlemagne extended Frankish sway over Croatian Pannonia, but left it to be administered by local Croat dignitaries. At this time the Croats were won over to Christianity, and Charlemagne assigned their ecclesiastical jurisdiction to the Aquileia patriarchate. In this way the Franks became the harbingers of Latin Christian culture to pagan Croatian Pannonia.

Now for the first time all the Croat-inhabited lands (both Pannonian and Dalmatian Croatia) were brought together under Frankish suzerainty, a fact that produced nascent movements for a Croatian polity. In 819 prince Ljudevit, a Croat nobleman, gave expression to such aspirations in the revolt he led of Pannonian Croatians against the Franks; but his movement was defeated and Frankish control was restored. In the ensuing years Croatia experienced unrest generated by the Frankish–Bulgarian struggle in the Drava and Sava area. When the Frankish state was eventually divided by the Verden treaty of 843, inland Croatia was subordinated to the eastern state (Germany), which was soon plunged in internal feuds. Coastal Croatia, on the other hand, was annexed to the western state (Italy), achieving de facto independence in the second half of the 9th century.

Once more, a foreign presence induced the Croats to pursue a state organization of their own. This time it was the Magyars, whose massive arrival in the Pannonian plain placed the adjacent Croats under threat. The latter reached an accord with their kindred in Dalmatian Croatia under prince Tomislav (*c.*910–28) who, after he fought wars with the Magyars as well as the Bulgarians, effected the unification of inland and coastal Croats in the first Croatian state extending from the Drava to the Adriatic coast. A former ally of Byzantium in Dalmatia, Tomislav turned later to Rome, which in 925 acknowledged him as king – the first in Croatian history.

This was a crucial stage in the papacy's campaign to ensure the dominance of the Latin Church among the Croats. The Dalmatian towns always represented bastions of Latin culture, while the Pannonian Croats espoused Latin Christianity through Franco-German influence. But after 863, when Byzantium embarked on its mission to convert the Moravian Slavs to Christianity by means of the Slavonic language, the trend towards Slavonic liturgy (which meant that church services were conducted in the native language of the congregation and not in Latin) made inroads into the Croatian lands, especially among the common people. To suppress its appeal, the Latin bishops of the Dalmatian towns sought to extend inordinately the ecclesiastical jurisdiction of the papal archbishopric of Split over the unified Croatian lands. This policy was pursued at the cost of the bishopric of Nin on the Croatian Adriatic which, under its bishop Gregory, represented the Slavonic-Croatian ecclesiastical movement. The mutual interests of the Croatian ruling elite and Rome effected the subordination of the Croatian lands to the spiritual jurisdiction of the archbishop of Split and the establishment of the Latin liturgy in Croatian churches. The Slavonic liturgy was banned (in fact it was marginalized in peripheral churches) and the bishopric of Nin was abolished. By these decisions, taken in two ecclesiastical synods in Split in 924 and 928, the Croats were placed firmly in the Roman-Latin cultural orbit.

Tomislav's successors struggled to sustain the Croatian state despite incipient Venetian antagonism on the eastern Adriatic. Croatia reached its height in the reign of king Petar Kresimir IV (1068–74) who annexed the Dalmatian towns as integral territory to his state, suppressing any residual Byzantine presence even as nominal overlord. In the ecclesiastical domain Kresimir, who had been brought up in Venice, encouraged an intensification of the role of the Latin in Croatia. As a result of new synods convened in Split (1060 and 1074) a purist campaign was launched by the Latin Church to discard any eastern elements in worship surviving from the earlier alternation of ecclesiastical authority between Constantinople and Rome over the Adriatic provinces. True, in the face of reactions among the people and the lower clergy, a more indulgent attitude was adopted following the synod of Split in 1079, and both the Church Slavonic language and the Glagolitic script (the first Slavonic alphabet devised by St Cyril) were permitted in central Dalmatia. In fact in some areas of Croatia the Glagolitic alphabet was adopted by Latin monks as a bulwark against surviving Greek Orthodox influences, to the point that it became known (falsely) as a Croatian script. Be that as it may, the final incorporation of the Croats into the Latin Church was a reality, and the Latin Christian faith became the vehicle of the Croats' accession to the culture of the western world.

In 1102, following a phase of instability, Croatia was united with Hungary in a "personal union", with the Hungarian king being separately crowned as king of Croatia too. Although this special coronation was omitted in the 13th century, the Croatian lands retained the status of annexed (*partes adnexae*) and not conquered lands (*partes subiugatae*). This settlement was to invite divergent interpretations as to the nature of the relationship between Hungary and Croatia, and the latitude of Croatian sovereignty it implied; the Croats, at any rate, never regarded this union as annulling the distinct status of their state.

Thenceforward Croatia was permanently removed from the Greek-Byzantine world, to which it had only briefly and half-heartedly subscribed. A brief restoration of Byzantine control in the mid-12th century over a large part of Croatia by the emperor Manuel I Komnenos was strictly a political episode with no cultural consequences. Following his death, Hungary acquired all the Byzantine possessions in Croatia and Dalmatia. There the Roman-Byzantine judicial tradition survived in the statutes of the coastal cities, which ensured their autonomy whether under Hungarian or Venetian rule. In modern times, from the early 18th to the mid-19th century, certain cities in Croatia (Zagreb, Karlovac, Osijek, and Slavonski Brod) accommodated some of the flourishing Greek colonies that were scattered in the ex-Yugoslav lands during Ottoman rule in Greece.

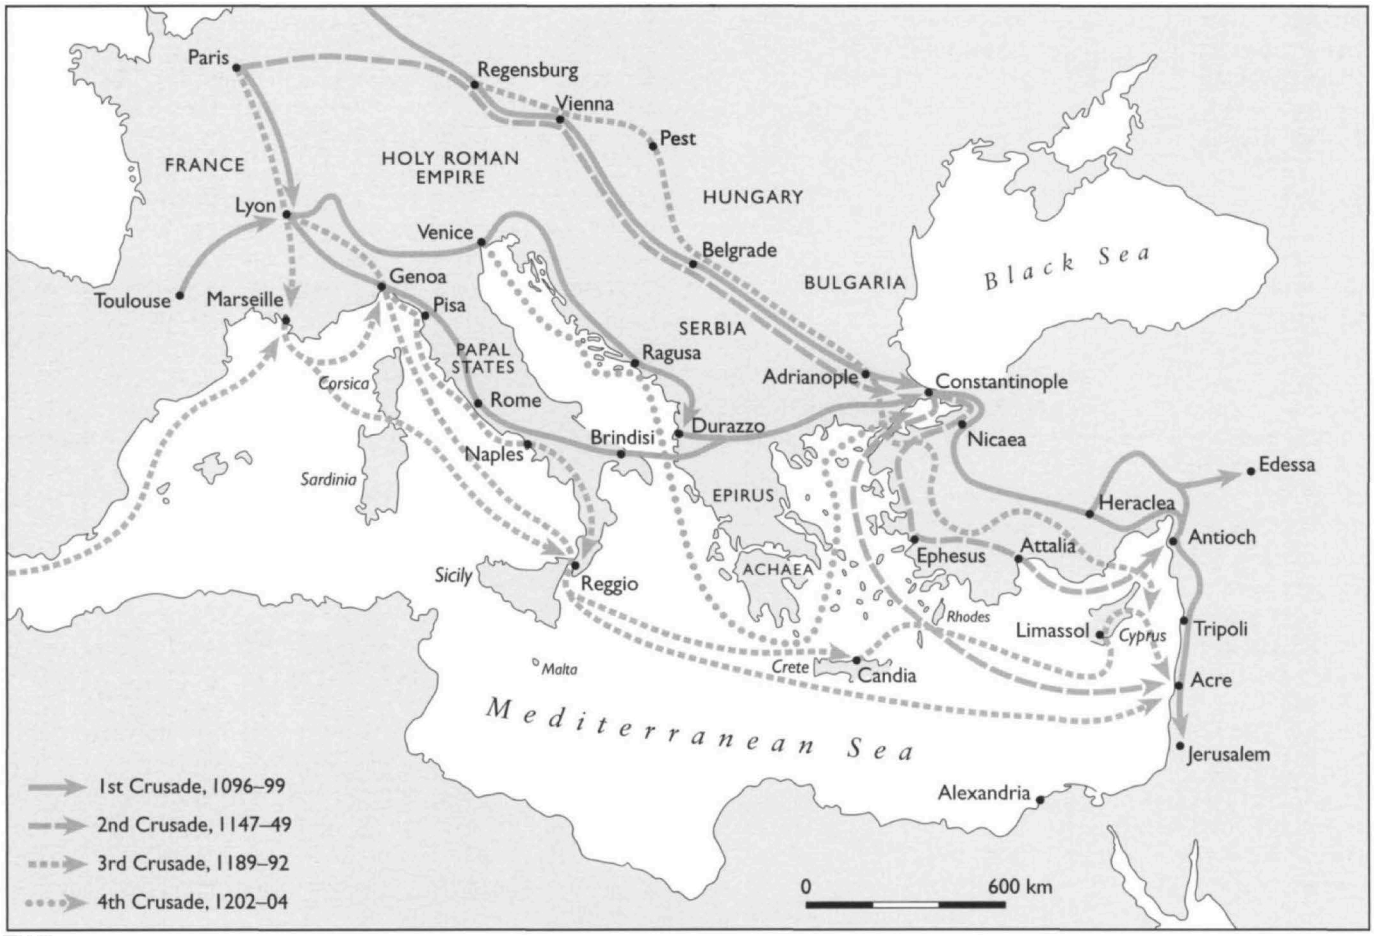
Crusades

The crusades were a military movement first launched by pope Urban II in 1095. They were directed against the enemies of the Church – initially the infidels who had occupied Jerusalem and were then threatening the Christians of the Byzantine empire. In conception the crusades were seen as a sort of armed pilgrimage undertaken at the behest of the pope and attracting certain privileges for participants, in the form of the protection of their family and property while they were away, and remission of their sins on the completion of their crusading vow. The response to Urban's appeal in the West was far beyond his expectations and reflects the heightened religious mood of the 11th century marked in part by increased pilgrim traffic following the millennium of Christ's birth. There was no

Crusades: Byzantine relief icon of the Archangel Michael, probably 11th century, looted by crusaders in 1204 and now in the Treasury of San Marco, Venice

one generally used term for crusading and for the crusader in the medieval period. By the early 13th century crusading had come to embrace expeditions directed not just to the recovery and defence of the Holy Land but also to the Iberian peninsula and northeastern Europe against heretics and schismatics and against other Christian lay powers dubbed the enemies of the popes. Quite when crusading came an to end is a matter for debate: the seizure of Malta from the Knights of St John by Napoleon in 1798 is a generally convenient terminal date, providing as it does seven centuries for the existence of the crusading movement.

With the coming of the crusades the period 1095–1204 witnessed the increasing presence of the Latins and their influence in the Greek east. As a result of the crusades in the 12th century knowledge and awareness of Byzantium were to be more widespread in the west and its wealth and commercial potential were to act as a lure to many. At the end of the 11th century the Byzantine empire was internally weak and surrounded by external enemies. The emperor Alexios I Komnenos (1081–1118) looked to the West for help and in that sense was responsible for bringing about the unhappy relations between Byzantium and the crusaders. There is no real evidence that he actually asked for a crusade. The letter written in Latin (not Greek) to Robert of Flanders stating that the empire was doomed if the faithful Latins did not help is almost certainly a forgery. The presence of Greek envoys at the



15. Routes of the first four crusades

Council of Piacenza on 1–7 March 1095 establishes that Alexios asked for help, but not what sort of help he wanted. On 27 November 1095 pope Urban II proclaimed the crusade at Clermont. What he actually said does not survive, but only garbled accounts written down from memory after the fall of Jerusalem which place the speech at the beginning of an inevitable process of triumph. It appears that Urban appealed for the relief of Christians in Palestine just as much as for the relief of eastern Christians within the former territories of Byzantium.

The West was already familiar with the idea of holy war or at least the idea of waging war with God's help, as is evident from the correspondence of pope Gregory VII (1073–85), the Norman invasion of England in 1066, and the case of El Cid in Spain. In many ways for the Greeks all wars were holy wars since they were fought in defence of the empire and for God's anointed, the emperor. It was the military aspect of the crusades that distinguished them from pilgrimages, and the idea of a penitential war-pilgrimage was something distinctly new in the late 11th century.

The crusaders had a mixed reception in Byzantine territory. In general, Byzantine organization stood up well to the demands for food made by these large contingents of crusaders passing through their territory. There were clashes brought about by hunger, the demands for markets, and cultural and linguistic differences. The Pecheneg cavalry, sent to escort some of the crusading contingents, often provoked a hostile reaction and villagers thought to be holding back much-needed food supplies or to be overcharging incited violence and plunder on the part of the crusaders. There was the baggage of history too to cope with. Anna Komnene reacts with suspicion and dislike of Bohemond, who just 10 years before had been campaigning in Thessaly against her father. For his part too he carefully stayed clear of areas with concentrations of Byzantine troops and was at pains to pick a route to the south and east of Durazzo that had not suffered from his depredation in 1085. In the hinterland of Constantinople Peter the Hermit's contingent, which arrived on 1 August 1097, reacted to food shortages by pillaging and, despite the friendly reception and advice that Alexios gave to Peter, he was relieved when this first army crossed over to Asia Minor. Nevertheless he sent a flotilla to rescue survivors of Peter's army after the disaster at Xerigordo. In December 1097 the troops with Godfrey of Bouillon ravaged the area around Adrianople in response to false rumours that numerous western leaders had been imprisoned by Alexios. There was suspicion and fear on both sides, which come through both in the pages of Anna Komnene and in western accounts of the crusade written after the capture of Jerusalem and in the perceived lack of support given to the cause by Alexios. The Greeks are stigmatized as treacherous and crafty, the westerners as untrustworthy, impulsive, violent, and rapacious.

At no time did Alexios seek to place himself at the head of this western army. Instead he persuaded the crusading leader-

ship to take an oath to return all cities and territories formerly in Byzantine hands, he offered advice on fighting the Turks, and he sent along his trusted general Tatikios (*fl.*1057–99) together with a small Byzantine force. Tatikios received the surrender of Nicaea in 1097. The events surrounding the siege revealed that western and Byzantine views of Islam differed markedly. The westerners had had little contact with Islam except in Spain and Sicily and their approach was based on ignorance and intolerance. Their crusading mission was to kill the enemies of God, while the Greeks kept their relations with Islam on a political level. All of this reinforced suspicion of the Byzantines in western eyes. Tatikios remained with the crusading army until February 1098 when during the siege of Antioch (December 1097–June 1098) he was forced to withdraw to Cyprus due to disagreements with Bohemond. In mid-June 1098 Alexios arrived at Philomelion in eastern Turkey with the intention, according to Anna, of marching to the assistance of the crusaders at Antioch. The distance between the two towns is more than 600 km and it is unlikely that this was the case. Western sources do not mention this intention and instead concentrate upon the treachery of Stephen of Blois and the other deserters from the camp at Antioch who are said to have spread false rumours of the crusader surrender to the Turks. The withdrawal of Tatikios and the non-appearance of Alexios at Antioch were conveniently taken by the crusading leadership to mean that their contract with Alexios made in Constantinople was at an end and that anything they conquered was their own. According to Anna, Alexios saw this failure of the crusaders to return Antioch as proof that the empire had gained nothing from the toil and expense of supporting the crusade. As a result the relations between Byzantium and the northernmost crusader states were uneasy. In 1108 (Treaty of Devol) Bohemond of Antioch swore allegiance to Alexios and acknowledged him as his suzerain. In 1158–59 the emperor Manuel I occupied Antioch and forced its ruler (Renaud de Chatillon) to acknowledge imperial overlordship and to accept an Orthodox patriarch. The relations between Byzantium and the other crusader states was far less clear cut.

The crusades of the 12th century were marked by western concerns to secure the route to Jerusalem by occupying the city of Constantinople. This concern surfaced early as Alexios was accused of sabotaging the crusade of 1101. In 1107–08 Bohemond launched an attack on Albania from Apulia; he captured Avlona and besieged Durazzo. Alexios blockaded Bohemond and forced him to agree to the Treaty of Devol (September 1108) by which Bohemond took an oath of vassalage for his principality of Antioch in western style and agreed to return to Italy. The Second crusade, called on 1 December 1145 as a response to the fall of Edessa the previous year, brought out into the open Byzantine fear of a crusader attack on Constantinople and the intention on the part of the crusading leadership to mount such an attack. The passage of the armies of both Conrad III and Louis VII had witnessed the usual tensions between Greeks and Latins. Manuel I had strengthened the defences of Constantinople. In September 1147 Conrad arrived at Constantinople ignoring Manuel's request that he bypass the city and cross over to Asia at Sestos. The two rulers never met, and it is said that Conrad eyed the defences of the city with interest with a view to returning the following year to capture it. He and his army moved off to Asia Minor, leaving room for the arrival of Louis VII in October. Again there were those in the French army who urged an attack on Constantinople either on their own or in alliance with Roger II of Sicily. Nothing came of these aggressive proposals, but they had been voiced. Roger II had declined to take the cross and during 1147 had captured the islands of Corfu and Cephalonia and sent raiding expeditions to attack Thebes, Corinth, and Euboea. Manuel had tried to raise German and French troops from the crusading armies at Constantinople to attack Roger, but without success.

In the run up to the Third crusade in 1188 Isaac Angelos was rumoured in the west to have received payment from Saladin to delay the crusading armies. This rumour may have played some part in the preference of both Philip Augustus and Richard I to go by sea to Palestine. Only Frederick I Barbarossa used the land route through Constantinople and his relations with the Byzantines led to serious fighting in Thrace and preliminary negotiations with the Hungarians and the Bulgarians to join in an attack on Constantinople. The re-establishment of the Bulgar kingdom in 1186 had damaged the Byzantine empire close to its capital. The breach between Byzantium and the west caused by Frederick Barbarossa was not healed, and the occupation of the city by westerners so that the approach to Jerusalem would be in reliable hands was now definitely on the agenda. The crusades had raised awareness of Byzantium and its wealth in the west, while at the same time Byzantium had lost much face in western eyes by its perceived treachery and its vacillation in the face of western aggression. The diversion of the Fourth crusade to Constantinople in July 1203 was in many ways the logical outcome of the crusading movement; the tensions and animosity had been there right from the start. The capture and sack of Constantinople on 12 April 1204 are generally regarded as the great tragedy of the Middle Ages because so many books and works of art were destroyed.

Following the Fourth crusade a number of crusader states were set up around the Aegean, nominally acknowledging the suzerainty of the Latin empire of Constantinople. Surrounded on all sides by hostile neighbours – Bulgarians, Greeks in Nicaea, and Greeks in Epirus – this empire had a short and threatened existence (1204–61). The papacy was prepared to issue crusading indulgences in defence of the empire both as a means of maintaining a secure avenue of approach for the recovery of the Holy Land and as a means of fostering Church union between the Greek and Latin communions, and this happened on numerous occasions between 1223 and 1320. Constantinople and the Aegean lacked the appeal of Jerusalem as a crusade destination and the response was poor except for those rulers such as the Montferrats and the Angevins with crucial political interests in the Latin empire.

During the latter part of the 14th century the advance of the Turks into the Balkans and the Aegean focused western attention on the defence of Constantinople as a bastion of western Europe itself in the face of Turkish attack. Despite scepticism in some quarters as to the efficacy of crusading, it still had much support and no shortage of new ideas both as to strategy and as to tactics. Alongside conventional land crusading such as the expeditions to Nicopolis (1396) and Varna (1444), there developed a variety of naval crusades such as the attacks on

Smyrna (1344), Lampsacus (1359), Alexandria (1365), Vonitsa (1378), Lepanto (1571), the continued resistance to the Ottomans mounted by the Knights of St John from their naval bases on Rhodes (1309–1523) and Malta (1530–1798), and the campaigns mounted by the Venetian Republic in the Aegean and Peloponnese down to 1718. Crusading as a movement and as an idea lasted for more than seven centuries and in each of those centuries left its mark on Greek lands: first in cooperation, then in opposition, and finally in defence. Indeed it is debatable just what role crusading ideology played in the philhellenism that recruited support for the Greeks in their War of Independence: perhaps the battle of Navarino on 20 October 1827 was the last naval crusade.

Cult: sacrifice at an altar before a statue of a god, Museum für Vor- und Frühgeschichte, Frankfurt

Cult

This article deals exclusively with pagan antiquity, because the change in the nature of belief and ritual with the coming of Christianity was so marked that it would be misleading to treat any aspect of Christian practice as having developed out of a pagan forerunner. Within the context of ancient Greek religion, "cult" refers to the rites and ceremonies of worship.

Most of the evidence for cult activity concerns official, public, service to the gods (*latreia*, *therapeia*). Participation in communal worship was one of the responsibilities of the citizen: at his trial, Socrates attempted to defend himself against the charge of not believing in the gods of the state by pointing out that he had been sacrificing regularly at the common festivals and on public altars (Xenophon, *Apology*, 10–11; cf. Plato, *Apology*, 26c).

But already in the Classical period, not even mere presence at ceremonies could be enforced, and at Athens at least, recourse was made to the "theoric fund", which provided the working poor with compensation for lost income so that they could attend public festivals. During the Hellenistic period it was not uncommon to declare public holidays during festivals, when businesses shut and people were adjured to take part. Schoolboys were often required to participate by marching in sacral processions.

The purpose of ritual was manifold: to avert the wrath of the deity, to obtain her or his goodwill, above all to establish a rapport between god and worshipper. The forms – more or less strictly adhered to – were based where possible on Homeric precedent. Thus the sacrifice performed by Nestor in *Odyssey*, 30. 418–63 served as a model for full-scale public sacrifices throughout antiquity, just as Odysseus' visit to the underworld (*Odyssey*, 11. 23–50) was the model for the worship of heroes and other ground-dwelling deities. In this sense, of being mined for guidance to correct procedure, the Homeric poems were the nearest the Greeks came to having a "Bible".

Invocations of and prayer to the deity were less important in themselves than they were to worshippers in the Judeo-Christian traditions; rather, they were integrated into the central act of public worship, that is, the donation of gifts in the form of sacrifices or votive offerings.

Animal sacrifice is the most spectacular example of this transaction. It is a procedure that the ancient Greeks had in common with peoples of the Near East (well summarized by West). Depending on the nature of the deity, the animals sacrificed were entirely consumed by fire, or were shared as food by both gods and men. Sacrifices of the first kind (*sphagia*, *enagismata*) were made to heroes and gods who were believed to reside underground. Heroes were dead humans whose mortal remains were worshipped, usually at the place of their burial. The purpose of sacrifice in these cases was to rejuvenate and/or revive the heroes so that they might come to the aid of the worshippers. Heroes were usually bound to a restricted geographical area. The standard method of sacrifice was to lay a fire in a pit (*bothros*), slaughter the animal over it, catch the blood and pour it or other liquids into the ground at or near the "tomb", and burn the whole carcass up. The invocation of the spirit of Agamemnon in Aeschylus' *Choephori* (84–164) is a good example of the procedure, with, in this case, a liquid offering (*pelanos*) poured out at the tomb.

The status of hero was accorded to a wide variety of persons: distant ancestors, founders of colonies (oecists), figures from epic; but in many cases the names, if they ever had them, are unknown to us. Generally speaking, when a hero's parents were known, one was divine, the other mortal (usually the mother: Achilles is a noteworthy exception). Two such – Heracles and Asclepius – became famous well beyond their original spheres, and reached the status of hero-god.

Gods, particularly those whose conventional abode was on Mount Olympus, received *thysiai*, the sacrifice of parts of animals burned on a raised altar (*bomos*). Here the model is Hesiod, who tells the "just-so" story of how the Titan Prometheus – a friend to mankind – duped all-knowing Zeus into accepting as his share of the sacrifice the fat and bones of the beast, leaving the edible meat and hide to man (*Theogony*, 538–42). In this kind of sacrifice the animal is consumed jointly by god and worshipper alike, and usually within the sanctuary itself. The valuable hides normally formed one of the perquisites of the priest.

Sacrifices often, but by no means always, took place within the context of a formal festival. There were also bloodless offerings, often occasional, such as the first fruits, and objects (ranging from items of clothing or armour to full-sized statues) symbolizing the dedicator or their achievements, offered as gifts. Some were thank-offerings for favours received (good crops, successful delivery from life's crises, such as illness or war); others were supplicatory.

The rituals of the cult were performed by "doers of sacred acts", *hiereis*, a term usually translated as "priests", which is misleading to us, because these people were functionaries rather than members of a discrete caste, the only exceptions being those officiants who introduced initiates into various mysteries, and who usually belonged to a hereditary priesthood. But even they were not set apart from their fellow citizens, except in the actual performance of their duties: for example, Callias son of Hipponicus, torchbearer of the Eleusinian mysteries and one of the richest men in Athens in the 5th century BC, negotiated the peace settlement with Persia that bears his name. Even the transmitters of the god's will at oracular sanctuaries were not priestly in our sense. Occasionally a priesthood might be restricted to a man or woman of a certain age, whose term of office might be measured in lifetimes. Most often, however, priesthoods were annual magistracies like any other.

Cult activity normally took place in a sanctuary, an area cut off (*temenos*) from the secular world and consecrated to the deity involved (*hieron temenos*, conventionally abbreviated to *hieron*). The seclusion could be marked by a wall or a series of boundary stones. It was rare for a sanctuary to be deconsecrated (there are examples in Greek settlements in Italy). The only essential feature was a space where people could gather. Most sanctuaries had an altar for the sacrifice, and many, but not all, had a structure, the temple (*naos*, dwelling place) to house the cult image and objects dedicated to the god. The sanctuary might also include semisecular structures, such as dining rooms for the consumption of the sacrificial meals. The cult image itself represented the god as his or her proxy: the Greeks were well aware of the fact that their gods were not to be tied to any one place, and that they would favour now one, then another.

Most public cults were open to all comers. Some, however, limited their clientele depending on the nature of the ritual. The Thesmophoria, for example, were restricted to women, while some sanctuaries of Heracles barred women altogether. Mystery cults, after initial screening for ritual purity, accepted almost anybody, but the central rites themselves remained a close secret known only to initiates. It is a measure of the respect in which the ancient Hellenes held their gods that to this day we know almost nothing about these rites. This is a salutary lesson to anyone who may think that the ancient Hellenes were not serious and pious believers.

Cyclades

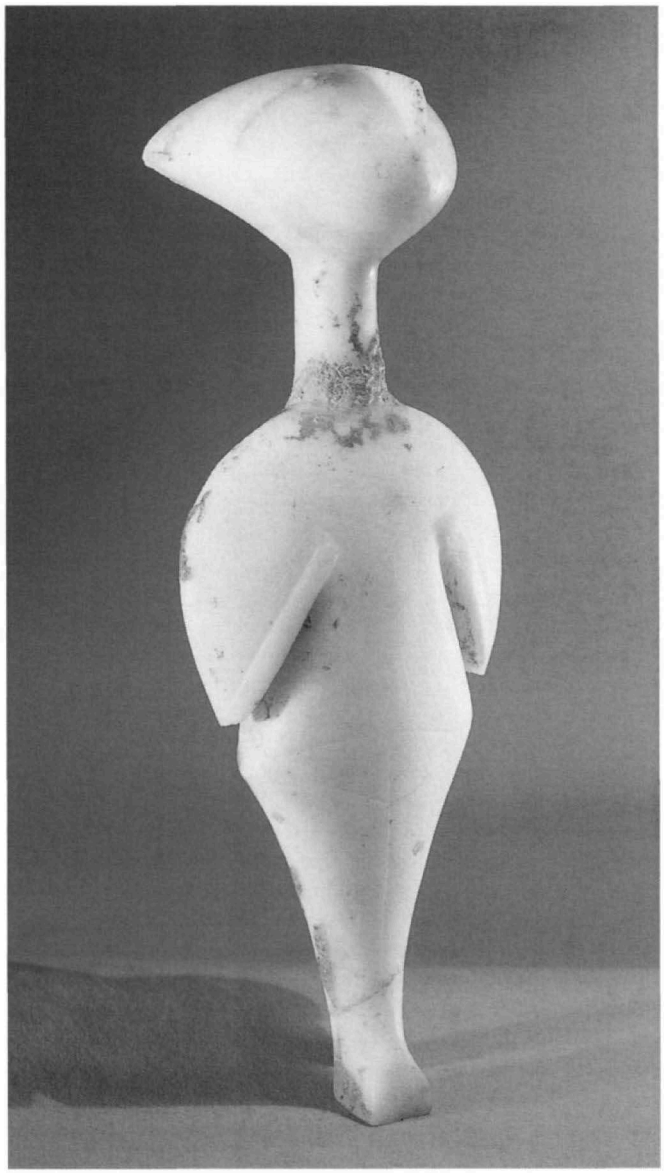
The Cyclades were named from their clustering in a rough circle round the ancient sacred island of Delos. In antiquity 12 to 15 islands were counted as part of the group. In the modern *nomos* (prefecture) there are a total of about 30 islands and islets, with the capital on Syros. The name is used in Byzantine sources with a quite different significance (see below).

Throughout prehistory people were drawn through the Cyclades, to Melos, at the southwest of the group, in quest of obsidian – a dark volcanic glass that was highly valued for cutting edges for tools and weapons. In the Early Bronze Age (mid-4th to late 3rd millennium BC), the culture of the Cyclades was distinct from that of the rest of the Aegean. During the ascendancy of the Minoan and Mycenaean palaces (2nd millennium BC), the islands shared in their cultures and were probably subject to their authority. The Cyclades were presumably part of the "Thalassocracy of Minos" mentioned by Thucydides. Their main contribution to Aegean culture of the time may have been as middlemen and experienced seafarers.

During the period of movement and change which followed the decay of Mycenaean civilization (11th century BC) new settlers arrived, mainly from Ionia (the coast of Asia Minor), but also from mainland Greece. Several of the communities which they founded then and in the following centuries grew into important centres. In the Archaic and Classical periods Naxos and Paros played important parts in the development of monumental architecture and sculpture, and various islands (Mykonos, Melos, Thera) had their own distinctive styles of pottery decoration. Several islands (Naxos, Paros, Thera, etc.) were active in the colonial movement and thus in the spread of Greek culture, especially to Italy and Sicily.

In the Persian Wars they were at first overrun by the enemy. Subsequently they joined the Delian League and became subject to Athenian control. In the late-Classical and Hellenistic periods they were controlled by the Macedonians and the Ptolemies, then by Rhodes, and finally the Romans.

From the Archaic period, or possibly earlier, the important sanctuary of Apollo on Delos drew people and wealth into the Cyclades. In Hellenistic and Roman times the island also



Cyclades: a "star-gazer" figure of the Louros type, made by people of the Grotta-Pylos culture, *c.*2800-2700 BC, private collection

became an important commercial centre, further stimulating activity in the area.

The remains of early Christian basilicas show that Christianity had taken hold in the Cyclades between the 4th and 6th centuries AD. In the early years of the Byzantine empire the Cyclades suffered at the hands of raiders from both east (Arabs) and west (Slavs etc.). Later they were divided between different areas of the Byzantine military command. At one time they belonged to a Province of the Islands. In the late 11th century the theme of the Cyclades included such islands as Ikaria and Karpathos not normally thought of as part of the group. In the 12th century Naxos may have been the base of a province called the "Dodecanese". Church construction suggests renewed prosperity at this time.

Following the establishment of the Latin empire at Constantinople in AD 1204, the Cycladic islands were assigned to Venice and by it to individual families, resulting in the establishment of local island or regional dynasties. Their castles and strongholds can still be seen on many islands. During the following centuries some of the local population became Catholic, and Catholic communities still flourish on some islands (e.g. Tinos, Syros) and survive on others (e.g. Naxos). Contacts have been maintained with western European Catholic countries. Naxos became an educational centre in the 17th century, when a French school and an Ursuline convent were founded. Earlier western connections were initially the result of the trading activities of the Italian maritime states in the Aegean; later, Greek traders were resident in Ancona (early 16th century). The islands were torn by the Veneto-Genoese wars in the 13th and 14th centuries and, ravaged by pirates, were depopulated in the 15th century.

After the fall of Constantinople in 1453 the islands were gradually (Tinos not until 1714) taken over by the Turks, who did not much interfere, though they levied taxes which were sometimes high.

In the 17th century the sanctuaries on Delos, Melos, and other places were looted of antiquities by English adventurers including the agents of Charles I and of Lord Arundel – a process which began the establishment of substantial collections of Greek antiquities in foreign countries. After 1770 some of the islands were annexed by Russia in the course of its war with Turkey.

After the Greek wars of independence, in which the islanders played their part, Syros became an important commercial centre (1829). Its capital Ermoupolis was founded by refugees and endowed with extraordinarily fine public buildings and houses for an island town. One sign of the wide external contacts is the Syrian commemorative plates (Syriana) which were manufactured in Britain for the island market in the 19th century. Other evidence of the commercial importance of the islands comes from Melos whose pilots had a high reputation, going back at least to the 16th century, and where there were resident consuls in the 19th century. One, the Frenchman Louis Brest, was responsible for the removal of the Venus di Milo to the Louvre.

After the discovery of the famous icon on Tinos in 1822 the island, and thus to some extent that part of the Cyclades, became one of the most important focuses for pilgrimage in the Greek Orthodox world.

In the 19th century travelling potters from the island of Siphnos operated throughout Greece: some settled in Athens (Maroussi). Many other islanders emigrated to Athens, attracted by work available in the new capital. The quarter of Anaphiotika, high on the slopes of the Acropolis, takes its name from settlement by people from the island of Anaphi, and other Athenian street names bear witness to migration, both then and later.

Since the Cyclades were hardly more than an artificial grouping, their contribution to the Greek tradition lies rather in the special circumstances which prevailed on specific individual islands from time to time, and the extent to which they were subjected to similar political or economic pressures because of their geographical situation. Thus, in the Bronze Age many of them were on trade routes between the mainland and Crete (and further south and east) and Melos was visited for its obsidian products. In the Dark Ages they provided secure refuges for the establishment of refugee communities.

Their natural affinity with the sea and interest in commerce and foreign settlement to augment their meagre resources chimed in with the preoccupations of other Greek states in the Archaic period. In later antiquity they shared in the fortunes of the wider Aegean. The presence of the Italian dynasties has left its mark on the Cyclades, not only in defensive fortification, but also in helping to establish Catholicism as the religion of a significant number of the local population. Pilgrims have been attracted to the area in antiquity by the sanctuary of Apollo on Delos, in modern times by the icon of the Virgin on Tinos.

ROBIN L.N. BARBER

Summary

Group of originally 12 to 15 islands that encircled Delos, the modern province includes about 30 islands and has its capital on Syros. Obsidian on Melos attracted visitors throughout prehistory. Part of the Delian League after the Persian Wars. Commercially important in the Hellenistic and Roman periods. Assigned to Venice after 1204 when some islands became (and remain) largely Catholic. Tinos is a major centre of pilgrimage today.

Cynics

The epithet "Cynic" ("doglike") was first applied to Diogenes of Sinope (?403–?321 BC), as a comment on the shamelessness with which he engaged in acts that were abhorred by other Greeks. Diogenes pursued a life of unqualified self-sufficiency, with only a barrel for warmth and a club for protection, styling himself a cosmopolitan or "citizen of the world". Arguing that actions which are based on natural impulses can never be unnatural, he defended even cannibalism and incest, and practised sexual intercourse in public. Freedom of action and freedom of speech were his watchwords, and he believed that he had found a way to make these common to everyone, not merely to the holders of civic privilege. It is said that when Alexander the Great, admiring his fortitude, asked if he could do anything for Diogenes, the latter asked him simply to "stand out of my way, because you are blocking the sun". Plato too was a victim of his calculated insolence, and the lost *Republic* attributed to him was evidently a riposte to Plato's dialogue of that title. For all that, Diogenes was regarded by many ancient writers not as a pure innovator, but as a "Socrates gone mad". The bridge between the ascetic of the 5th century and the fanatic of the 4th was Socrates' pupil Antisthenes (*fl.*400 BC), who held up self-denial as the chief principle of the philosophic life. Though never called a Cynic in his lifetime, he was regarded by some later commentators as the true founder of the school.

Most notable of Diogenes' early followers was Crates of Thebes (*c.*368–288 BC), who differed from other Cynics in his willingness to curtail his freedom by marriage; he and his wife Hipparchia are reported nonetheless to have shared Diogenes' indifference to prevailing sexual customs. Crates was for a time the teacher of Zeno, who is usually regarded as the founder of the Stoics. While the Stoics could not condone the licentiousness of Diogenes and Crates, there were some, like the slave Epictetus (*fl.*AD 100), who represented the better kind of Cynic as an imitator of Heracles and a model of virtuous living. Epictetus is one of many moralists who adopted the homely and trenchant style of the Cynic diatribe. This form was devised to bring philosophy to the masses by Bion of Borysthenes, who taught around 315 BC in Athens, and does not seem to have adhered uniquely to any sect. In his ethics, which was the whole of his philosophy, he reduced all goods to pleasure and all knowledge to sense-perception in the manner of another Socratic school, the Cyrenaics; while he looked back to a golden age of virtuous frugality in which each man was his own governor, he did not dispute the present rights of kings. The diatribe was adapted to new purposes in the pseudo-Platonic *Clitophon*, the *Hermetica* (Treatise 7), and above all in the polished works of the orator Dio of Prusa (Dio Chryososstom, 1st century AD), who composed fictitious speeches for Diogenes and Socrates, but reserved his most obsequious and eloquent precepts for the emperor Trajan.

Another form which the Cynics bequeathed to literature is the medley of prose and poetry known as Menippean satire, named after its originator Menippus of Gadara (3rd century BC). Its most prolific exponent was probably Oenomaus, a Hellenized Jew of Gadara (*fl.* AD 120), whose works, like those of his fellow townsman, have not survived in any quantity. Menippus, however, figures frequently in the dialogues of the 2nd-century satirist Lucian. Famous for his ridicule of philosophers, society, and the gods, Lucian repudiates the more disgusting habits of the Cynics while expressing admiration for their ideals. Nevertheless, when others praised the sacrifice of Proteus Peregrinus, who threw himself on a pyre of his own construction at the Olympic Games of AD 169, Lucian denied that he could be called a second Heracles or even a genuine Cynic; he undertook to demonstrate instead that he was a renegade from the Church.

Though Lucian need not be believed, the hypothesis that Jesus was a Cynic has been entertained by a number of recent scholars, especially those who hold that the common source of

Luke and Matthew ("Q") is the most authentic record of his teaching. Evidence is found in the aphoristic sayings of Jesus (reminiscent of Diogenes and Lucian's teacher Demonax), and the poverty of his disciples, who carried only a staff and a wallet in their mission to the Galilaean cities. It must, however, be emphasized that Cynics worked no miracles, did not live in communities, did not commend humility, and (whatever they thought of kings) never promised anyone a kingdom. The manner of Jesus is evidently different from that of Paul, yet it has been maintained that the latter was indebted to the diatribe as a model for his letters. The arguments for this position, while copious and occasionally impressive, are always vitiated by the difficulty of determining what ought to count as a specimen of the form.

Popular opinion in antiquity, noting that Christians held aloof from sacrifice and occasionally from marriage, appears to have equated them with Cynics and to have suspected them of similar or worse atrocities. Perhaps it was the desire to maintain a distance that led Justin Martyr into his fatal feud with the Cynic Crescens; yet Tatian's pupil Justin has been suspected of adopting Cynic tenets when he founded a community of "encratites", who eschewed both meat and sexual intercourse. In fact, though some later Cynics may have practised vegetarianism, the dietetic axiom of Diogenes and Menippus was that nothing is forbidden; and when Cynics avoided marriage, it was only because they wished to maintain the right to promiscuity. When Christian writers speak of Peregrinus as a paradigm of fortitude, it is not because they regard him as a Christian; and even if the dirtiness and illiteracy of Christian monks reminded pagan observers of the Cynics, their cenobitic lifestyle and the worship of God were practices which that antisocial movement could not share. It was the emperor Julian "the Apostate" who proposed the loftiest interpretation of Cynicism, arguing that the vices of Diogenes concealed a profound critique of human laws (*Orations*, 6–7). The Church itself did little to foster the sect, which disappeared in the 6th century AD. As its legacy to Greek culture it left the adjective "cosmopolitan" (adopted by the Stoics and applied to Abraham by Philo, the Jewish precursor of Christian allegory), and the works of Dio and Lucian, the latter of whom can still be read for amusement, as well as for the elegance of his style.

MARK EDWARDS

Biography

Cynics were followers of Diogenes of Sinope (?403–?321 BC) who was called *kyon* ("dog") for his rejection of social conventions, though some regarded Antisthenes (*fl.*400 BC) as the true founder of the school. Diogenes' most notable successor was Crates of Thebes. The sect survived until the 6th century AD.

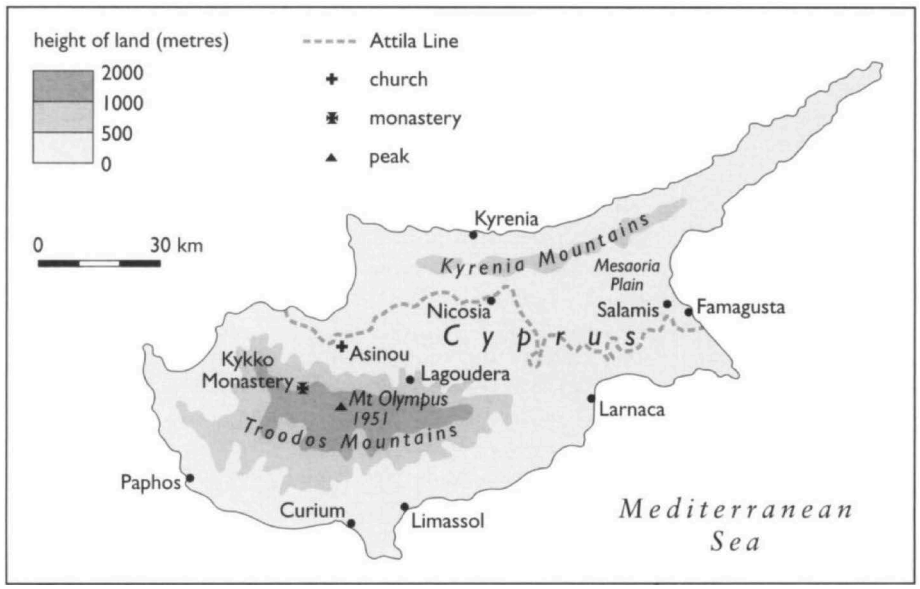
Cyprus

The island of Cyprus is the third largest in the Mediterranean and lies in its northeastern corner, just 70 km from the Turkish coast to the north and 103 km from Syria to the east. The nearest Greek island is Castellorizo, 270 km to the west, followed by Rhodes at 386 km to the west. Cyprus itself has a maximum length from east to west of 222 km, and a maximum width of 95 km. Geographically, it is dominated by the igneous Troodos mountain range in the centre of the island, rising to a height of 1951 m at the pineclad Mount Olympus, and by the long Kyrenia (or Pentadaktylos) range stretching along the north coast. Between them and extending to the east coast is the fertile Mesaoria plain. The west and northwest areas of the island are mountainous and often rugged; the south and east coasts depend on the rivers coming down from the Troodos mountains; the coastal plains in the north are fertile and well watered. The climate is semi-arid, and throughout its history human settlement has been heavily influenced by the need for water.

The first contacts with the Aegean world date from the Middle Bronze Age (*c.*2000–1600 BC), with a series of vases imported from Crete, mostly found in tombs along the north coast. The first large-scale contacts came during the Late Bronze Age (*c.*1600–1050 BC). During much of this period Cyprus had a complex urban civilization based on agriculture and copper production, with extensive trade links throughout the eastern Mediterranean. Important cities such as Enkomi on the east coast and Hala Sultan Tekke and Citium on the south coast near Larnaca clearly controlled large parts of the island both economically and politically, and one or more of them seems to have been the "Alashiya" mentioned in Near Eastern texts. The Cypro-Minoan script of this period, so-called because of its apparent similarities to Linear A on Crete, was probably used for bureaucratic purposes in large administrative buildings in the main cities. Although it has not been deciphered, it is clearly not Greek.

During the 14th century BC there was a great increase in the amount of Aegean pottery coming to Cyprus, mostly from Mycenae, and by the 13th century BC Mycenaean-style pottery was being manufactured on Cyprus. Pottery alone is insufficient evidence for the arrival of a Greek-speaking population on the island, but it is abundantly clear that by the Iron Age most Cypriots were speaking a dialect of Greek. The most plausible occasion for this demographic change is in the upheavals of the 13th and 12th centuries BC, when the "Sea Peoples", migrants and refugees from the west, were travelling, raiding, and settling across the eastern Mediterranean. The first known Greek inscription in Cyprus was found in an 11th-century BC tomb in Palaipaphos in the west, a bronze spit with the name "Opheltes". Although clearly a Greek name, and using a grammatical form characteristic of the Arcadian dialect of Greek, this is written in the Cypriot syllabary, a development of the Cypro-Minoan script adapted for the use of the Cypriot dialect of Greek.

The earlier part of the Iron Age (*c.*1050–475 BC) seems to have been characterized by a low population and simple social structure. In the 8th century BC the characteristic city kingdoms began to develop, with local elites maintaining their power using elaborate ceremonial and luxury goods imported from



16. Cyprus

the east. During this period there is an increasing number of inscriptions in Greek, written in the Cypriot syllabic script. This culminated in the 6th century BC, when a significant number of people were literate enough to write names on tombstones or dedications at sanctuaries. At the same time there was a considerable increase in imported pottery from Greece, particularly from east Greece and Athens, and Greek styles of sculpture had a strong influence on local Cypriot traditions, as seen in the many dedications in rural and urban sanctuaries.

From the beginning of the 5th century BC Cyprus appears regularly in the Greek written sources. We have an account in the pages of Herodotus about the participation of most Cypriot cities in the Ionian Revolt against the Persians in 499 BC, though they were retaken by the Persians in the following year. In political terms the 5th and 4th centuries BC were largely taken up with struggles against the Persians. The Athenian general Cimon led an expedition to Cyprus in 450 BC, but he died the next year, and his forces, after failing to take Salamis, returned home. A local player who acquired major influence in these power games was Evagoras I, king of Salamis from 411 to 374/73 BC, whose reign was vividly though uncritically described by his eulogist, the Athenian orator Isocrates. Resolutely pro-Athenian, he used his political and diplomatic skills to resist the Persians, increase his own power over the other city kingdoms of Cyprus, and disseminate Athenian art and culture. It was during his reign that the Greek alphabet began to displace the ancient Cypriot syllabary.

When Alexander the Great laid siege to Tyre in 332 BC, he was aided by 120 Cypriot ships, and although he never actually came to Cyprus, he made it clear that he was the island's master by issuing coins in his own name. At his death in 323 BC Cyprus, like most of his empire, was fought over by his successors, particularly Ptolemy and Antigonus. The city kingdoms aligned themselves on each side of the dispute; when Ptolemy sent an expedition there in 312 BC, the cities that had opposed him were punished and, in the case of Marion, destroyed. From this time until the Roman annexation in 58 BC, apart from one brief interlude, Cyprus was part of the Hellenistic empire of the Ptolemies of Egypt, sharing in the common Greek civilization and culture of the eastern Mediterranean.

Cyprus was annexed by the Romans in 58 BC, ostensibly because of the island's support of pirates. After being restored to Cleopatra of Egypt, it was taken by the future emperor Augustus in 31 BC, and transferred to the Senate in 22 BC. Apart from the Jewish insurrection in AD 116 and several earthquakes, this was a peaceful period in the island's history. The cities of the island boasted the usual trappings of the Roman provinces of the Hellenized east: bath houses, theatres, gymnasiums, temples, villas, honorific statues, inscriptions in Greek, and also local elites who benefited greatly from their role in the Roman administration of the province. In the countryside there was a considerable population, which supported itself through agriculture and produced wine, olive oil, flax, timber, and copper in sufficient quantities for export. Most famous of the works of art of the Roman period are the mosaics from villas in Paphos and Curium, which depict a wide variety of scenes from Greek mythology.

In AD 45 St Paul and the Cypriot St Barnabas visited the island, and according to the Acts of the Apostles they converted the Roman governor in Paphos. There was little sign of the spread of Christianity in the island until the 4th and 5th centuries, when considerable numbers of basilican churches were built in towns and cities across the island, and Cypriot bishops attended the great ecumenical councils and synods at Nicaea and elsewhere. The long campaign by the Cypriot Church to be independent from the patriarchate of Antioch was finally won in 488, when the remains of St Barnabas were discovered near Salamis and as a result the emperor Zeno gave the archbishop of Cyprus full autonomy. Treasures such as the 6th-century mosaics from the church of Panagia Kanakaria and the 6th- and early 7th-century gold and silver vessels from Lambousa bear witness to a rich artistic tradition during this period.

The large population and rich culture of the early Byzantine period were interrupted by the Arab invasions, which began in 649. For more than three centuries Cyprus existed uneasily under a condominium of the Byzantine emperor and the Arab caliph. Conditions improved in 965 when the island was reoccupied by the emperor Nikephoros Phokas, and during the 12th and 13th centuries there was an increase in population and a flowering of Byzantine ecclesiastical art and architecture. The frescos of mountain churches such as that of Panagia tou Arakou at Lagoudera (*c.*1192) are as fine as any in the Greek Orthodox world.

The political status of Cyprus changed abruptly in 1191. When part of the fleet of Richard I of England, on his way to the Third Crusade, was blown off course, it landed in Limassol and was opposed by the semi-independent ruler, Isaac Komnenos. When Richard himself arrived, he postponed his

crusade for long enough to campaign against Isaac, who finally surrendered later in the year. Because of the expenses of the crusade, Richard attempted to sell Cyprus to the Knights Templar for 100,000 byzants, but in spite of their oppression of the local people the knights could not raise this sum. Richard repossessed the island in 1192 and gave it Guy of Lusignan, the recently ousted king of Jerusalem. So began a period of Frankish rule that lasted for almost 300 years.

Cyprus under Lusignan rule was organized in a classic feudal system. Land was owned either by the state or by Frankish feudal barons. The Greek subjects were divided into serfs, those who paid an extra annual tax to give themselves a modicum of independence, and those who held their land by free tenure. Serfs had to pay a tithe usually amounting to a third of their produce and a heavy poll tax, and owed two days of forced labour a week. For most Greek Cypriots under Lusignan rule life was a matter of hard and unrewarded agricultural labour. The Orthodox Church fared little better. In 1196 a Latin archbishopric and three bishoprics were established, fully endowed with land and tithes from the Greek subjects, and before 1220 no Orthodox prelates were permitted at all. According to the *Bulla Cypria* of 1260, the Orthodox archbishop and bishops were made formally subordinate to their Latin equivalents.

A slight improvement in general conditions for the Greek populace of Cyprus came in 1432 with the accession of John II, whose wife Eleni Palaiologina was the daughter of the despot of the Morea in the Peloponnese. For all her severity towards her husband (and his mistress) she was a strong supporter of the Orthodox Church and the Greek language in Cyprus, and it was during the 15th century that the use of Greek spread to the upper classes as well as the peasantry. John II's daughter and successor, Charlotte, was another Greek-speaker, but in the characteristic machinations of the period she was usurped by her father's bastard son James II. James was succeeded by his Venetian wife Caterina Cornaro, who in spite of her liking for the people of the island was unable to resist the power and greed of her compatriots, and in 1489 she was forced to abdicate in favour of the Venetians.

Conditions under Venetian rule were, if anything, worse than before, since Cyprus was now merely a distant province of the imperial city. Venice's main interest was to increase its own wealth, both that of the state and of its aristocratic families, by means of heavy taxation, the control of monopolies such as salt, and large estates producing crops such as sugar for export. An uprising in 1562 was led by two Greeks, a teacher and a cavalry officer, and supported by many local noblemen, but was betrayed and its leaders executed. The protests by the Greek populace following this demonstrated the widespread antipathy to Venetian rule. Only the Orthodox Church fared better during this period, and apart from its low revenues it had more equable relations with the Latin Church. Clear western influences can be seen in the Orthodox Church architecture and icon painting of the period.

The Venetians' lack of interest in developing and protecting the island meant that defences against the growing Ottoman threat were begun too late, and it was only in 1567 that work was started on the fortifications of Nicosia and Famagusta. In 1570 the Ottoman sultan Selim II demanded that the Venetians cede Cyprus to him; the Venetians naturally refused, but their relief expedition never reached the island. The Ottomans landed in July, and took Nicosia in September after a six-week siege. Famagusta held out for longer, but finally fell in August 1571, its defenders starving and vastly outnumbered. The Venetian officers were massacred, and their commander, Marcantonio Bragadino, was flayed alive.

In many ways Ottoman rule was a welcome relief to the Greek Cypriots. Taxation was reduced and rationalized, with tithes being set at one-fifth and forced labour reduced. With the expulsion of all Frankish Catholics, the Orthodox Church was reinstated as the principal Church of the island. Under the Ottoman *millet* (community) system, it was responsible to the authorities for the political control of the Orthodox Greeks, as well as for the extraction of taxes from them. This gave the archbishop and his prelates genuine power, particularly since they could appeal to Constantinople over the head of the Ottoman governor. By the 18th century the Greek *dragoman* or "interpreter" who managed the administration of the Greek *millet* was often a rich and powerful figure in his own right, as for example was Hadjigeorgakis Kornesios at the end of the century.

A system that should have worked well in theory was less successful in practice. Governors were keen to recoup what they had spent on bribes to gain their appointment, and with frequent corruption and extortion at many other levels, the peasant farmer was hard put to produce enough to pay the necessary taxes and bribes as well as supporting himself and his family. These difficulties were compounded by the frequent droughts, locust attacks, and plagues, and during the 17th century the population of Cyprus dropped dramatically, owing to deaths through plague or starvation and to emigration. Another reaction to excessive taxation was a series of "tax rebellions", for example that against the governor Chil Osman Agha in 1764, when Greeks and Turks together protested against his extortions. When the Greek War of Independence broke out in 1821, the governor Küçük Mehmet called for reinforcements from the sultan and began executing Christians. In July 1821, in spite of no further actions against the authorities, the archbishop was hanged and the three bishops beheaded. Further massacres continued, Church property was plundered, and a considerable number of Greek Cypriots fled the island.

As the 19th century wore on, desultory attempts at reform and greater economic contacts with Europe brought about a general improvement in conditions. A more radical change came in 1878, when according to a deal struck behind the scenes at the Congress of Berlin, the sultan agreed to allow the British to administer Cyprus in return for their support against Russia. In July the British fleet anchored off Larnaca, and the remaining Turkish authorities handed over power without argument. The Greek Cypriots initially welcomed this change in status, even though they had not been consulted about it. The British cession of the Ionian islands to Greece in 1864 was taken as an indication of a similar attitude towards Cyprus, and in 1882 the new Liberal government in Britain allowed the Greek community to teach in Greek and control its own educational system. In spite of this, the British gave no genuine political participation to the Cypriots, and spent little on the development of the island, particularly as every year they extracted a sum of £92,800 as "tribute" to the sultan (or rather to his

creditors). During the 1920s and 1930s demands for *enosis* or union with Greece grew, and they culminated in a demonstration in October 1931 at which Government House was burnt to the ground. The British governor suspended the constitution, disbanded the Legislative Council, which was never to be reinstated, and outlawed the flying of the Greek flag.

Apart from a significant Greek Cypriot contribution to the Allied war effort in World War II, relations between the Greek Cypriot community and their British rulers remained poor. The governor's proposals in 1947 for an elected legislature were rejected, and in 1950 a plebiscite of Greek Cypriots showed 96 per cent in favour of *enosis*. In April 1955 the National Organization of Cypriot Fighters (EOKA) began its armed campaign to expel the British and win *enosis* with Greece. A series of bombs exploded, and leaflets proclaimed that with God's help and the support of all the forces of Hellenism, the struggle to throw off the British yoke had begun. This struggle took four years, during which many more bombs were thrown, archbishop Makarios was exiled to the Seychelles, civilians and policemen were killed, and nine Greek Cypriots hanged. After long-drawn-out negotations a compromise among Greek Cypriots, Turkish Cypriots, and the British was agreed: instead of *enosis*, Cyprus would become an independent state within the Commonwealth, with a Greek Cypriot president and a Turkish Cypriot vice-president. This came into effect with the raising of the flag of the Republic of Cyprus on 16 August 1960.

The new constitution was complex and artificial, and turned out to be unworkable. At the end of 1963 president Makarios's proposals to alter it were rejected by Ankara, and intercommunal fighting quickly broke out. A mission from the United Nations arrived in 1964 to try to maintain peace between the two communities. After further intercommunal clashes in 1967, the new military junta in Athens withdrew its Greek forces, and the island was in political terms almost entirely divided. On 15 July 1974 the right-wing Greek junta orchestrated a coup against the more moderate president Makarios, during which the presidential palace was shelled and destroyed. On the pretext of protecting Turkish Cypriots from an extremist Greek regime, the Turkish army invaded Cyprus, with its first landings on the north coast taking place on 20 July. By the time the ceasefire line was drawn across the island on 18 August, 200,000 Greek Cypriots had been made refugees, 1619 were listed as missing, and the Turks had captured 37 per cent of the island's territory, including the fertile Mesaoria plain.

Since the invasion there have been sporadic intercommunal meetings and UN-sponsored negotiations, but little or no progress has been made. The island is divided by the "Dead Zone" and its minefields and observation posts, while through the centre of Nicosia runs a scar of barbed wire, sandbags, and weed-choked streets. In the occupied areas the names of streets and villages have been changed from Greek to Turkish, while churches have been closed, abandoned, or turned into museums. In the government-controlled areas new settlements house the refugees, while road signs still point hopefully northwards to Kyrenia and Famagusta. In spite of this catastrophe, however, an awareness of Cyprus's long and rich history, especially its distinguished Hellenic heritage, is very much alive in contemporary Greek Cypriot society, and plays a powerful role in the country's education system and in its cultural and political life.

Summary

The third largest island in the Mediterranean, Cyprus has had close contact with the Aegean since the Bronze Age. Mycenaean-style pottery was made on Cyprus by the 13th century BC. The earliest Greek inscription dates from the 11th century BC. City states began to develop in the 8th century and by the 6th century Greek artistic styles were prevalent. War with Persia dominated the 5th and 4th centuries. After Alexander Cyprus was ruled mostly by the Ptolemies until taken by Rome in 31 BC. From 649 to 965 the Byzantines shared rule with the Arabs. In 1191 Richard I of England took Cyprus and gave it to Guy of Lusignan. Taken by Venice in 1489 and by the Ottomans in 1570/71, Cyprus was a British possession from 1878 to 1960 when it became a republic. Since 1974 northern Cyprus has been under Turkish occupation.

Cyrenaica

Region of north Africa

Cyrenaica forms the eastern territory of modern Libya. There are two distinct areas of occupation — the uplands and the fertile coastal plain. The account of the Greek colonization of Cyrenaica is provided by Herodotus (4. 150–59). The Delphic oracle directed Grinnos, the king of the island of Thera (modern Santorini), to go and found a city in Libya. This advice was ignored, and after a seven-year drought on the island, the oracle reminded the islanders that they should send a colony to Libya. The Therans sent to Crete for advice about Libya, and as a result they came to the island of Platea (the site of which is disputed) and left a Cretan fisherman there while they returned to Thera. The Therans then sent out a group of colonists selected by lot under the leadership of Battos, and a settlement was established on the island. After further inter-

Cyrenaica: view of the 6th-century basilica at Apollonia, the port of Cyrene

vention from the oracle, a mainland settlement was established opposite the island of Aziris in eastern Cyrenaica. The site itself has been plausibly identified by the presence of Protocorinthian, East Greek, Cretan, and Greek pottery at the mouth of the Wadi el-Chalig. Eventually a settlement was established at Cyrene, and the numbers of Greek settlers in Cyrenaica were supplemented after a further oracle from Delphi.

Details about the establishment of Cyrene are recorded on a 4th-century BC inscription which gave the people of Thera honorary citizenship in recognition of the earlier links with the city. A section within the decree purports to be a record of the original decision of the Therans. There were apparently conditions about staying in Libya for five years before being allowed to return to Thera if the colony did not succeed.

After the foundation of the Greek colonies during the 7th century BC, Cyrenaica came into increasing contact with its eastern neighbour Egypt. The Egyptian pharaoh Apries marched against Cyrene in 570, but this attacked was foiled and led to the fall of Apries and his succession by Amasis as pharaoh. Amasis, who according to Herodotus established the Greek trading establishment of Naucratis in the Nile delta, fostered links with the Greek world, and in order to establish a link with Cyrene, married Ladice, a member of one of Cyrene's leading families. In 525 Egypt was annexed by Persia, and Cyrenaica soon became part of its larger empire following a Persian invasion which reached as far as Euesperides. Cyrene regained some independence during the 5th century BC.

Cyrenaica supported Alexander the Great and subsequently became part of the Ptolemaic kingdom. This period is reflected in the way that some Cyrenaican cities were renamed in honour of the Ptolemies: Euesperides became Berenice, Taucheira became Arsinoë, and Barca became Ptolemais. Evidence from Apollonia shows that the walls of Apollonia were constructed in the late 2nd to early 1st century BC according to an Egyptian unit of measurement. Cyrenaica was finally bequeathed to Rome on the death of Ptolemy Apion in 96 BC.

As part of the Roman world, Cyrenaica was initially a joint province linked with Crete. The status of the Greek community is reflected in the edicts of Augustus, dating to 7/6 BC and 4 BC, which demonstrate the perceived tension between Greeks and Romans in the province. It is not clear how far the Greek constitutions of the Cyrenaican cities continued into the Roman period. One decree from Tocra, dating to the 1st century BC, seems to suggest that the citizen body had diminished, though a number of villages across Cyrenaica probably retained their Greek identity into the imperial period. Through the 1st century it is clear from a number of inscriptions that Jews were being allowed to take part in Cyrenaican civic life. The rivalry between the two parts of the population led to a

revolt in Cyrenaica and Egypt under the Roman emperor Trajan when, as Eusebius (*Ecclesiastical History*, 4. 2) described it, the Jewish population "broke into factious strife against their fellow Greek citizens".

Cyrenaica's identification in the Greek world was re-emphasized by the inclusion of Cyrene in the Panhellenion established in Athens by the emperor Hadrian; indeed one citizen of Cyrene served as an official of the Panhellenion in 157. Hadrian's patronage of Cyrenaican cities in the aftermath of the destruction of the Jewish revolt placed an emphasis on Cyrene's origins in the Greek world and the colonists from Thera.

Cyrene had a number of major sanctuaries including temples of Apollo and of Zeus Ammon, the latter a cult linked to the famous Egyptian oracle in the Western Desert. Both seem to have been constructed in the 6th century BC. Outside the city was a major sanctuary of Demeter. Analysis of the bones from the sanctuary shows that pigs were a favoured sacrifice, as might be expected in a sanctuary of Demeter. Archaic sculpture from the city included *kouroi* and *korai* of a type found elsewhere in the Greek world. Cyrene itself issued silver coinage, probably from the late 6th century BC onwards.

Barce, on the west side of the Cyrenaican upland, was next to be established, apparently during the reign of Arcesilas II, perhaps in the 560s. This was followed by expansion in the coastal areas, with the creation of Apollonia (later renamed Ptolemais as the harbour for Cyrene, and the city of Euesperides (later replaced by the Hellenistic city of Berenice, and now the modern Benghazi) in the west. Excavations at Euesperides have revealed a carefully planned city; the earliest grid and settlement can probably be dated to at least the middle of the 6th century BC, though some deep excavations on the Sidi Abeid indicate an earlier settlement is likely. A further settlement was located on the coast at Taucheira where part of the sanctuary of Demeter and Kore has been excavated. Both Apollonia and Taucheira are recorded as being foundations of Cyrene, though Herodotus (4. 171) records that the latter was a polis of Barce.

Cyrenaica was well known for its agricultural produce. For example, probably during the 320s BC, Cyrene sent grain to some 41 Greek cities in response to a severe food shortage; Athens alone received the equivalent of 6000 tonnes, and the total gift was around 50,000 tonnes. Cyrene's prominence in the second half of the 4th century BC is perhaps also reflected in the construction of a Doric treasury at Delphi, probably in the 330s. Cyrenaica was also the source for silphium which was used for medicinal purposes among other things. The plant was used as an emblem on the coins issued by Cyrene. Members of the Cyrenaica elite enjoyed the benefits of horse rearing; a number of Pindar's odes (Pythian 4, 5, and 9) celebrate victories by Arcesilas IV and Telesicrates in the Pythian Games.

Cyrene

City in north Africa

Cyrene was the most important of the Greek colonies founded in north Africa during the 7th century BC and later. The region (to which Cyrene gave its name, Cyrenaica) was reasonably well watered and therefore fertile, but had the Sahara to the south, and was separated from Egypt by the Western Desert, with further difficult country to the west isolating it from Tripolitania (which in antiquity was a region of Phoenician and Carthaginian settlement). Cyrenaica was thus in effect a self-contained region, eventually divided among a number of Greek foundations. Contacts with the Aegean world preceded the period of colonization, and must already have existed in the Bronze Age. The Minoan harbour town of Kommos, on the south coast of Crete, with its great built shipsheds would have served for maritime links with the coastal regions of Africa immediately to the south. Even in the 1st millennium BC the coastal waters of Cyrenaica were visited by Greeks (the area produces excellent sponges) before Greek settlement took place.

Cyrene is important in the history of Greek colonization not only for the detailed account of the circumstances of its foundation in Herodotus (4. 145–50) but also for the inscription,

Cyrene: view of the ancient city which was colonized by Greeks from Thera, *c.*630 BC

found in Cyrene itself, which gives the text (perhaps a later edited version) of an oath supposedly sworn by the founders. The colony was sent out, around 630 BC, by the Aegean island of Thera (modern Santorini) after consultation of the oracle at Delphi. The reason was overpopulation, and the Therans had to order the colonists to stay for at least five years after the first attempt at settlement in Africa proved unsucessful. They eventually settled on a small offshore island, then on the mainland, eventually moving inland to the site of Cyrene itself. Most Greek colonial foundations in overseas, non-Greek districts remained adjacent to the coast and safety. Cyrene was unusual in being situated well inland, 25 km away from the sea, on the edge of the inland plateau that stretches southwards to the Sahara. It is not clear how this was achieved in the presence of an indigenous population; either they were too few to resist, or, for some reason, they welcomed the Greek settlers. The latter is more likely, since the settlers themselves would not have been that numerous, and a non-Greek stratum persisted in Cyrene throughout its history.

The settlement was led by a man called Battos. He and his descendants ruled Cyrene as kings until their overthrow in the 5th century BC. The city prospered considerably. It produced corn on a large scale (at one critical moment in the late 4th century BC, when there was a failure of the harvest in mainland Greece and Egypt withheld supplies of corn in order to boost the price, Cyrene was able to provide an alternative source of supply, an act recorded with gratitude in Greece itself). Equally important was the product of a plant called silphium, which seems to have been a form of drug much prized in Greece, and which was so important to Cyrene that it is represented on its coins. There is an important Greek vase, a cup made in Laconia, which depicts King Arcesilas II of Cyrene supervising the loading of bales (of silphium? or more prosaically wool, another export) into the hold of a ship. The choice of subject suggests that Sparta had close contacts and hence, a very real knowledge of Cyrene. Indeed, so much Laconian pottery has been found in Cyrenaica that it was originally thought to be of local origin.

Cyrene grew up round an abundant spring of the nymph Cyrana, who gave her name to the city. Below the spring was the central sanctuary of Apollo which, though later rebuilt, contained an important example of an early Doric temple. The main part of the town lay above and to the south of the temple. A road led up to the agora, which included the tomb of the founder Battos (though the actual structure of the tomb is 4th-century BC in date). Beyond this was the greatest of the city's temples, an early 5th-century dedication to Zeus. The city itself, like most colonial foundations, was laid out to a grid plan.

Cyrene remained largely aloof from the mainstream history of Greece: its retention of a monarchy until well into the 5th century is in some respects an indication of this. With the

conquest of Egypt by the Persian king Cambyses, Cyrene became attached (loosely, again because of its geographical position) to the Persian empire. Similarly, after Alexander the Great had added Egypt to the area of his rule, the Cyrenaicans deemed it prudent to make their submission to him. With the break-up of Alexander's empire Cyrene was once more independent, but eventually became part of the kingdom of the Ptolemies based on Egypt and Alexandria. Ptolemy III married a Cyrenaican, Berenice, as his queen, and other prominent Cyrenaicans (such as the poet Callimachus) were attracted to the court at Alexandria. With the decline of the Ptolemies, Cyrene became a separate kingdom, ruled by a branch of the Ptolemaic royal family. The last of these, Ptolemy Apion, bequeathed his kingdom to the Romans on his death in 96 BC.

Under the Ptolemies a substantial Jewish population established itself at Cyrene, as at Alexandria. In the 2nd century AD the Jews of Cyrene joined in the widespread Jewish rebellion against the Romans, and Cyrene was badly damaged in the resulting turmoil. Subsequently the city revived, but the temple of Zeus, though reroofed, did not have its fallen colonnade re-erected. Cyrene continued to flourish in the late empire. There are (as in the other Cyrenaican cities) important early Christian churches there, but the main centre seems to have shifted to the harbour town of Apollonia. Cyrene itself gradually withered, and with the Arab conquest ceased to be a place of any significance.

Paradoxically, this withering away resulted in a remarkable degree of preservation of its ancient remains. With the Italian occupation of Cyrenaica much excavation was carried out and was continued after the war by the Libyans under their Director of Antiquities, Richard Goodchild. Much was restored. The great gymnasium, turned by the Romans into a Caesareum, which had fallen in an earthquake, was re-erected. But the most poignant survival (now less well preserved) was the surrounding environment with its ancient roads, lined with monumental cemeteries and running out into the hinterland through a field system which still retained its ancient boundaries.

R.A. TOMLINSON

Summary

Colony founded on the north African coast by Greeks from Santorini *c.*630 BC led by Battos. His descendants ruled Cyrene until the 5th century BC. Ptolemaic Cyrene produced Callimachus and Berenice, queen of Ptolemy III; it also housed a large Jewish population. Christianity was established at nearby Apollonia. Cyrene was taken by the Arabs in the 7th century and lost its significance in the Greek world.

Cyril I Lukaris 1570–1638

Patriarch of Constantinople

Cyril Lukaris, ecumenical patriarch of Constantinople (1620–35 and 1637–38), was a prelate of distinctive character, who strove to secure the enlightenment of the Greek people, and particularly the Orthodox clergy. His activities belong to a period when the Catholic Church was waging war on the Reformation, and he played a pioneer's role in the project to establish a Greek press in the East, with the aim of spreading the faith, which was threatened by the proselytizing policy pursued by Rome.

Konstantinos Lukaris was born in Herakleion, Crete, in 1570, and took the name Kyrillos (Cyril) when he became a monk. Descended from a well-known family, he studied in Crete under the theologian Meletios Vlastos, and went on to complete his studies in Italy with the aid of his uncle and mentor, Meletios Pigas, patriarch of Alexandria. He perfected his knowledge of Greek, Latin, Italian, and theology in Venice under the famous scholar Maximos Kargounios, and also availed himself of the opportunity to attend the lectures given by Cesare Cremonini in Padua. It was at this time, moreover, that he began to correspond with David Hoeschel and Friedrich Sylburgius, both of whom were men of letters, reformers, and publishers of important works of Greek literature.

In 1592 he broke off his studies and entered the service of the patriarch of Alexandria. He was swiftly appointed *protosynkellos* (chancellor) of the patriarchate by his uncle, who assigned to him the mission of travelling to Poland as exarch in order to avert the unification of the Orthodox Ukrainians and White Russians with the Catholic Church. Lukaris left Poland in January 1601 without achieving this aim; he began to realize, however, that the two Churches should come together again in the interests of Christendom. This same year Meletios Pigas died, and was succeeded by Lukaris on the patriarchal throne of Alexandria.

Little is known about Lukaris's activities as patriarch of Alexandria, except that he worked strenuously to restore the finances of the patriarchate. During a visit to Constantinople in 1611, he became acquainted with the ambassadors of England, Thomas Rowe, and of Holland, Cornelius Haga, who played leading roles in countering Jesuit propaganda in Turkey. In 1604, moreover, a close alliance had been created between England, Turkey, Holland, and Sweden, with the aim of checking the ambitions of the Catholic Church.

In 1612, Lukaris was appointed "Overseer" of the ecumenical throne, and in the same year Timotheos II became ecumenical patriarch (1612–20). From this time on, Lukaris' enemies began to defame him in every way possible, judging him from his ideas and actions to be a Lutheran. Lukaris did not change his views, however, and continued zealously to enter into relations with Protestant theologians, church dignitaries, rulers,

Cyril I Lukaris: 17th-century portrait

and kings, who were using all possible means to oppose the Roman Church and its proselytizing methods.

After the death of Timotheos II the Holy Synod elected Lukaris as patriarch of Constantinople on 4 November 1620. Immediately after his installation, he turned his attention once more to the Union of Brest, which for two and a half decades had caused disquiet in the Eastern Church, and particularly in the patriarchate in Constantinople, despite the fact that the Greeks of Constantinople had made clear their hostility to the Polish king, Sigismund III. In 1610 the Polish armies captured Moscow and Sigismund's son was elected Catholic tsar of Moscow.

In his anti-Catholic arguments Lukaris sought to implement views adopted by the Orthodox tradition, many of which were apparently of a reforming nature. Certainly, the ecumenical patriarch continued until his death to believe that the Calvinists and the Orthodox should unite forces against Rome, at the same time aiming at a gradual rapprochement with the teaching of Calvin. Lukaris believed that in this way he would purify Orthodoxy of distortions, perversions, and the influence of Rome, and eventually arrive at the point when the "true" Orthodoxy would be identical with the Reformation.

The main reason that impelled Lukaris to atrempt to establish a printing press in the Phanar was his concern at the fact that it was impossible for Orthodox clergy to be educated in anything other than Catholic schools and universities, such as the theological school founded by the Jesuits in Constantinople. In 1616 he entered into a correspondence with George Abbot, the archbishop of Canterbury, asking that some gifted students of theology be admitted to higher education in English universities. One of those who benefited from Lukaris's policy was Nikodimos Metaxas, who studied in London from 1622 to 1626.

Lukaris's great desire to found a Greek press was one of the main reasons for sending Metaxas to London, where, in addition to his theological studies, he could become initiated in the printer's art. Lukaris had already attempted to found a Greek press some time previously. When he was in the town of Lvov in Poland, as emissary of Meletios Pigas, he had succeeded, in cooperation with Arsenios, archbishop of Elasson, in printing four books between 1591 and 1593, with Greek texts and parallel Slav translations.

After Metaxas had worked in London as an apprentice printer, he assembled the necessary printing materials and in June 1627 embarked on the ship *Royal Defence*, bound for Constantinople, accompanied by two assistant printers. On his arrival in Constantinople in 1627 he printed a book with the title *Of our most Blessed and most Wise Father*, written by the patriarch Cyril Lukaris. This initiative by Lukaris alarmed those opposed to his intentions, who were urged on mainly by the Jesuits and the French ambassador, and the Turks raided Metaxas's home on 22 June 1628, impounded all the printing materials, and expelled Metaxas. This brought an inglorious end to the first attempt to establish a Greek printing press in the East.

Lukaris's administrative activities, his struggle against Catholic propaganda, and the foundation of a printing press were not in conflict with the Orthodox tradition, and only a few who kept his company or corresponded with the patriarch were in a position to know of his reforming programme. Lukaris desired to come into contact and become acquainted with the official representatives of the Reformation Church, and his close colleague Mitrophanis Kritopoulos travelled to Germany, England, and Switzerland to examine the *Confessio Helvetica* and the *Confession* of Basel, in order to assess how far these views were consistent with Orthodox beliefs.

Beginning in 1628, the Propaganda Council in Rome had begun to publish a large number of books in the Greek language supporting unification, many of which were distributed free to the Orthodox population. The Dutch ambassador Haga sought to convince Lukaris that the time was right to publish his own *Confession*. The Patriarch intended publishing it on the press in the Phanar. After the violent closure of this press, however, the Latin text of the *Confession* was printed in 1629, possibly in Geneva, containing an explicit confirmation of its authenticity by the Dutch ambassador.

The work shook public opinion in both the West and the East as few others have done, and provoked a savage reaction, fuelling an impressive number of publications, for in his *Confession* the ecumenical patriarch declared openly that he embraced the teaching of Calvin. Most of the Orthodox prelates were naturally opposed to the views expressed by Lukaris in his *Confession*, but he also had his supporters, including Theophilos Corydalleus, who in 1639 wrote that the *Confession* was in conformity with the teaching of the Greek Church. Strong doubts were immediately expressed about the authenticity of the work, and within a short space of time

Lukaris's *Confession* saw several reprints and translations, and there were written criticisms calling into doubt the authorship of the text generally. Whatever the truth of the matter, the authenticity of the *Confession* has continued to be a vigorously disputed issue down to the present day.

From as early as 1618, Lukaris had planned to write a catechism in the demotic language; in the end, what he succeeded in doing was to make the Bible generally accessible through his translation of the New Testament into demotic Greek. With the fervent support of Antoine Leger, parish priest at the embassy of the Netherlands in Constantinople, the work was published in Geneva, at the press of Pierre Aubert, in 1638. The difficult task of editing the text was assumed by the monk Maximos Rhodios from Galipoli, who died in 1633 leaving the work unfinished; at this stage a large number of uncoordinated proofreaders took over who were not Greek, and when the book was eventually published it contained a great many serious linguistic errors.

The publication of Lukaris's *Confession* exercised a decisive influence on the development of the doctrines of the Orthodox Church and the position of the Patriarch within it, as well as on foreign relations. In March 1635 the Jesuits succeeded, after long efforts, in having Lukaris dethroned. He was replaced by Kyrillos Kontaris. About two years later, in March 1637, Lukaris was restored to his throne.

Lukaris's enemies were not disheartened, however, and, led by Kyrillos Kontaris, they wove a tissue of false accusations against him to the vizier Vayram Pasha during the absence of the sultan, Murad II, as a result of which the patriarch Cyril Lukaris was put to death by strangulation on 27 June 1638.

KONSTANTINOS STAIKOS

Biography

Born Konstantinos Lukaris in 1570 in Herakleion, Crete, he took the name Cyril on becoming a monk. He was educated in Crete and in Venice and Padua. In 1592 he joined the staff of the patriarch of Alexandria and was sent on a mission to Poland. In 1612 he became Overseer of the ecumenical throne and in 1620 was elected patriarch of Constantinople. Publication of his *Confession* in 1629 in which he accepted Calvinist doctrines made him many enemies, and in 1638 he was strangled.

Cyril, St 826/27–869

Missionary to the Slavs

St Cyril (Constantine the Philosopher) was, together with his older brother St Methodios, the inventor of the Slavic Glagolitic alphabet and a prominent Byzantine diplomat. His baptismal name was Constantine; Cyril was the monastic name that he adopted shortly before his death in Rome on 14 February 869. The seemingly interminable dispute as to the ethnic origins of "the Apostles of the Slavs" has not been resolved. Born in Thessalonica in 826 or 827 to a Byzantine army officer of middle rank and a mother who some scholars have hypothesized was Slavic, Constantine went to Constantinople to pursue studies that would lead to a career in the imperial service. The main source on his career, the *Life* written (in Old Church Slavonic) at the instigation of his brother Methodios shortly after Cyril's death, mentions that St Cyril studied in Constantinople with the future patriarch Photios (858–67 and 877–86), one of the greatest Byzantine intellectuals and an imperial adviser. In addition to receiving a broad grounding in secular and religious subjects, Constantine the Philosopher showed an extraordinary talent for languages, which equipped him admirably for diplomatic missions. After a short service in the chancery of the patriarch and an intermittent academic career, he went on a diplomatic mission (851 or 855–56) to the Arab caliph Mutawakkil (847–61). Later he joined his brother in a monastery on Mount Olympus in Asia Minor. Photios soon called on him to participate in a mission to the Khazar court (860–61), where he again demonstrated his abilities in religious polemic, this time against Jewish and Muslim proselytizers.

The historically most significant mission of SS Cyril and Methodios was the one to Moravia (862–63), where the "Apostles of the Slavs" introduced for the first time an Old Church Slavonic liturgy written in the Glagolitic alphabet. It is unknown when they devised the Glagolitic alphabet, which was derived partly from the Greek minuscule script, partly from Syriac and Coptic, and partly an original invention of St Cyril. The statement in a 13th-century Bulgarian *Life* of St Cyril that he had introduced the Slavic liturgy into southern Macedonia before the Moravian mission appears to be groundless. In any case, when the Moravian prince Rastislav (846–70) requested Christian missionaries acquainted with the Slavonic language, the patriarch Photios chose the two brothers from Thessalonica. Political and religious motives seem to have converged both in Rastislav's request and Byzantium's response. Moravia, which historical scholarship has traditionally located in the Czech and Slovak lands, had already begun to be incorporated into the Frankish ecclesiastical structures, but Latin was an incomprehensible language to the Slavs of central Europe. In addition, both prince Rastislav and the emperor Michael III seem to have considered a Frankish–Bulgarian alliance threatening. The patriarch Photios had his own reasons for favouring the introduction of a vernacular Slavic liturgy, because he was competing with the papacy for the spiritual allegiance of the Slavs. The Cyrillo-Methodian mission proved a short-term success in Moravia, although its long-term consequences lay elsewhere. A Slavic Church was set up in Moravia, and Cyril translated the gospel

and liturgical texts, such as the liturgy of St John Chrysostom, from Greek into Old Church Slavonic. He thus laid the groundwork for the development of Old Church Slavonic as a written literary language.

Cyril's and Methodios's mission in Moravia stumbled, however, over the strong opposition of the Frankish bishops supported by the eastern Frankish emperor Louis the German (817–76). The Byzantine missionaries fervently opposed the "three-language heresy" of the Franks, who claimed that the divine liturgy was permissible only in Hebrew, Greek, and Latin. In this way, Byzantium showed a more flexible attitude towards the formation of "national" churches under the spiritual aegis of Constantinople. A temporary support for the Slavic cause was found in the papacy. At the invitation in 867 of pope Nicholas I, who was interested in reducing the influence of the local Frankish bishops, Cyril and Methodios journeyed to Rome. There they received the blessing of the new pope, Hadrian II (867–72), who solemnly authorized the use of the Slavonic liturgy and ordained their disciples. After the death of St Cyril in 869, the furtherance of a Slavonic Church devolved on Methodios.

The momentous long-term consequences of the Moravian mission lay not in central Europe, but in the Balkans and in Russia. Moravia fell out of the Byzantine orbit in the 880s, while the Glagolitic alphabet was supplanted almost entirely by the Cyrillic (apart from Croatia, until the late 20th century). Nevertheless, the translations prepared by St Cyril were the first steps in the emergence of a Byzantine-Slavic Commonwealth bound by a common religious and cultural heritage. After their expulsion from Moravia the disciples of SS Cyril and Methodios successfully introduced the Slavic liturgy into Bulgaria which had been converted to Byzantine Christianity in 864. Bulgaria salvaged and expanded the Cyrillo-Methodian heritage, especially during the culturally productive reign of king Symeon (893–927). From here, Slavic writings and the alphabet spread to Serbia and Russia. New translations of Byzantine theological, literary, and legal texts were prepared by Bulgarian scholars working at Symeon's court. The Cyrillic alphabet was a result of an attempt by St Cyril's and St Methodios's disciples in Bulgaria to adapt the Greek uncial script to the phonetic peculiarities of the Slavonic tongue. The process of transliteration of Glagolitic texts into Cyrillic was almost entirely completed by the 11th century. To the present day the modern alphabet of the Orthodox Slavs – the Bulgarians, the Serbs, and the Russians – is a simplified version of the Cyrillic script introduced into medieval Bulgaria.

Another long-term effect of St Cyril's work of translation was the emergence of Old Church Slavonic as the lingua franca of the Orthodox Slavs. Because St Cyril managed to render masterfully in Slavonic the rich variety of Greek vocabulary and syntax, and because Slavic languages were relatively close to each other at that time, Old Church Slavonic established itself as the third literary language in Europe. A trained Byzantine diplomat sent on an imperial mission, but also a person sympathetic to the fate of the Slavs, St Cyril left a double-sided legacy: he drew the Orthodox Slavs irreversibly into the orbit of Byzantine civilization and contributed to the development of their own cultural identity.

DIMITER G. ANGELOV

Biography

Born in Thessalonica in 826 or 827 and baptized Constantine, St Cyril (the monastic name by which he was later known) was educated in Constantinople, where he was a pupil of the future patriarch Photios and perhaps of Leo the Mathematician. He taught philosophy at the Magnaura school (whence his soubriquet "the Philosopher"). But he is best known for his mission, undertaken in 863 with his brother St Methodios, to the Slavs for whom he devised both an alphabet (the Glagolitic) and a liturgical language (Old Church Slavonic). He died in Rome in 869.

Cyril of Alexandria, St *c.*378–444

Patriarch of Alexandria

Cyril of Alexandria is one of the most important of the Christian Greek theologians, and was a major protagonist in the great Christological crisis of the 5th-century Church. The conciliar debate that he initiated at the Council of Ephesus (431) went on to determine the agenda of three following ecumenical councils up to the 7th century. To this extent he is rightly regarded as the chief architect of Byzantine Christology, even though his work was built upon important predecessors (especially theologians in the Alexandrian tradition) and was frequently modified in its later reception. The longterm politi-

cal implications of these complex and often bitter Christological arguments, allied with the Arab invasions of the 7th century, had the effect of disconnecting important Christian Churches in Syria and Africa from Byzantine and Latin currents, and made severe divisions in the ecclesiastical polity of the East (the so-called Monophysite schism) that have remained active to this day.

Cyril was born some time around 378. His uncle Theophilus became Archbishop of Alexandria in 385, and brought Cyril to Alexandria to be educated. From his youth, then, he observed the ascendant power of the Christian Church in one of the most volatile cities of the empire. His education is apparent from his mature works, and shows that he received rhetorical training, as well as a substantial grounding in biblical exegesis and the theological tradition of the previous Fathers, especially the writers of the Alexandrian school. His Classical allusions (in his *Contra Julianum*) are derived from earlier Christian literature. He himself probably thought that his great biblical commentaries would have earned him lasting fame, but it was his Christological apologetic writing that achieved this result.

At the end of his studies, around 403 when he was 25 years old, Cyril was ordained lector of the Alexandrian Church, and was closely attached to his uncle's court. In the same year he attended Theophilus at the notorious Synod of the Oak, which deposed John Chrysostom. Cyril had learned his craft of leadership from a turbulent master, and when his uncle died on 15 October 412, the Byzantine administration of the city tried to pre-empt his election as a successor. The governor's office pushed forward the candidacy of the archdeacon Timothy, but it was Cyril's party that won the day. The clash between the ecclesiastical factions caused grave disturbances in the city. Cyril was consecrated as archbishop on 18 October 412; he was 34 years of age. The historian Socrates recounts the troubles of his early administration: his confiscation and seizure of the Novatianist churches (continuing in a milder manner the "aggressive" policy of his uncle Theophilus as permitted by a wider policy of the Theodosian dynasty); mob violence involving attacks on Jewish elements who had purportedly fired a Christian church; the infamous murder by Church factions of the philosopher Hypatia; and increasing friction with the Christian governor Orestes. In 416 an imperial investigation into Alexandrian affairs determined to restrict the guild of *parabalanoi* (the unofficial bodyguard of the archbishop), but within two years the number was again increased to more than 600 and officially placed under Cyril's personal direction, a mark of high imperial confidence. During this earlier period of Cyril's administration, he was also engaged in the active process of the evangelization of an Egypt still strongly devoted to the old religions, especially the cult of Isis. Fragments of sermons and discourses survive from 427 relating his establishment of a new healing shrine of the Unmercenaries Cyrus and John adjacent to the famous shrine of Isis at Menouthis. In this deliberate attempt to undermine the old religion Cyril portrayed himself as both "holy seer" and strong power. His policy of active, and sometimes aggressive, evangelization was advanced by marauding monastics, such as those communities under the control of Shenoudi of Atripe.

After 428 Cyril's life changed dramatically. In that year the patriarchal throne of Constantinople was taken by Nestorius, a monk from Antioch. Nestorius assumed office in a city that had been wracked by disputes, and unsuccessful parties to the election gave him a hostile reception from the start. In his early days he was asked to adjudicate in a seemingly minor semantic problem about whether Mary could be rightly called the Mother of God (*Theotokos*). He tried an eirenic compromise by suggesting that she would be more correctly called "Mother of Christ". The local dispute flared from that point and it soon emerged that what was really at issue was a major collision between the Antiochene Christological tradition (that of Diodore of Tarsus and Theodore of Mopsuestia) and the Alexandrian school (Athanasius and Didymus) of the previous generation.

Cyril was well aware of all the ramifications of the argument from the outset, by means of his political staff in the imperial city, but he did not intervene directly until after Christmas 428, when Nestorius had been publicly denounced by enemies in his own cathedral. In the spring of 429 Cyril composed a paschal letter to his own extremely large archdiocese, insisting that Christ must always be regarded as a single divine person, and that the reality of his humanity must not distract the Christian mind from that fundamental position. It is, though embryonic in exposition, the base of all his detailed arguments that were to follow. By 430 Cyril had prepared the ground well, and sent for the information of the Roman Church a dossier of damaging information about his opponent. He was laying the basis of a formal charge against Nestorius. Rome reacted quickly, putting the matter on the agenda for a synod to be held later that same year. In Constantinople Nestorius pushed ahead, now teaching that only Antiochene theology should be regarded as the normative discourse of the imperial Church. The city was much disturbed by his agenda and, though the emperor seemed to be on his side, the Augusta Pulcheria, many monks, and several sections of the aristocracy were becoming increasingly hostile. In 430 Cyril composed his five-book *Against Nestorius*, which engaged battle directly. In August 430 the Roman synod announced that it condemned Nestorius' teaching, and supported that of Cyril. In response, Cyril summoned a synod of his own Church and sent off a demand that Nestorius should recant. Trying to disarm matters, the emperor Theodosius II called for the whole dispute to be settled by an international synod, which met at Ephesus in the summer of 431. Cyril manoeuvred the complex and confused proceedings and took the role of president himself. Nestorius refused to appear on such terms, and objected to matters beginning before the (late) delegation from the Antiochene Church arrived. By a significant majority, Nestorius' teaching was rejected, but a few days later, when the Syrian bishops finally arrived, they held a minority countersynod anathematizing the first. All the chief parties were then held under house arrest by the frustrated imperial officers, while the emperor called a series of meetings at Chalcedon to resolve the impasse. On 25 October 431 a new archbishop was elected in Nestorius' place. Nestorius himself was sent back in disgrace to his monastery in Syria; Cyril was freed to travel back in triumph to Egypt.

During the following years, between 432 and 444, there was a slow healing of the breaches between Alexandria and the Syrian Churches, patiently presided over by imperial negotiators. Eventually in 433 a compromise was reached in which the

important points of the Antiochene position (Christ had two authentic natures – both human and divine) could be reconciled with Cyril's insistence that Christ was a single reality, one divine person. But the precise ramifications of that agreement still needed much clarifying debate, and without this it was inevitable that the intellectual argument would soon break out again with even greater force. It did so with greater bitterness in the following generation. In his later years Cyril continued a relentless attack on Antiochene theological traditions, but by then he had reached an acclaimed international status as a theologian, and ever afterwards his works became a kind of standard for the majority eastern Christian tradition, setting the agenda (though not unopposed) for the councils of Ephesus (449 – not regarded as ecumenical), Chalcedon (451), and Constantinople (553 and 680–81). He died on 27 June 444, a little short of his 70th year.

Cyril's role as one of the most powerful brokers of ecclesiastical power in the Theodosian dynasty has commanded much scholarly attention. His formative impact on Christian theology concerning the person of Christ and the effects of salvation (especially later Byzantine "deification theory") and his exegetical works remain of enduring importance.

Biography

Born *c.*378 at Mahalla in Egypt, Cyril was educated in rhetoric and biblical exegesis at Alexandria under the tutelage of his uncle, Archbishop Theophilus. Ordained *c.*403, he succeeded his uncle as patriarch in 412. His early administration was marked by conflicts of factions in a turbulent city, but he was an active evangelist and after 428 campaigned vigorously and successfully against Nestorius, Patriarch of Constantinople. He died in Alexandria in 444.

Cythera

Island off the southern Peloponnese

Throughout its history Cythera, renowned in antiquity as the island sacred to Aphrodite (hence the title "Cytherean" Aphrodite), was involved either with the course of events in the Peloponnese or with Crete. During the Byzantine period it became closely linked with developments in the southern Peloponnese, while during the Venetian period Cythera became more closely associated with Cretan affairs. This double orientation of Cythera was naturally a result of its position, midway between the Peloponnese and Crete.

Cythera is mentioned in Ptolemy's *Geography* and in the *Geography* of the Anonymous of Ravenna, as well as in the *Tabula Peutingeriana* and the *Synekdemos* of Hierokles. A coin from Kastri identified as depicting the emperor Constantius II suggests that travellers were coming to the shores of Cythera in the mid-4th century AD. People may still have been coming to the island in order to worship Aphrodite; or fishermen may have come to gather the highly prized purple-yielding shellfish from which the island had acquired a second name, Porphyrousa. In the subsequent early Byzantine centuries no known written sources refer to the island. It is only thanks to archaeological excavations at Kastri that we know, from numismatic and ceramic evidence unearthed there, that the island was inhabited in the 7th and 8th centuries.

After the Arab conquest of Crete (*c.*824) the rocky indented coastline of Cythera served as a shelter for Saracen pirates. The 10th-century life of St Theodore describes the island as deserted and unapproachable because it was a "haven for the godless Agarenes" (Saracens). St Theodore, who subsequently became patron saint of Cythera, was born in Coroni in the southern Peloponnese. During the reign of the emperor Romanos I Lekapenos he came from Monemvasia to the island of Cythera in order to become a hermit. With the reconquest of Crete by the Byzantine emperor Nikephoros Phokas in 961, piracy in the region declined markedly. It is at this time that Cythera was settled anew. The governor (*gastaldo*) of the island in the following period was a certain George Pachys of Monemvasia. Towards the end of the 12th century the island was granted to the powerful family of Eudaimonoyannis of Monemvasia. Cythera now entered a period of relative tranquillity and prosperity, and it was probably at this time that the fortified settlement of Hagios Dimitrios was built. In 1238 Nicholas Eudaimonoyannis, realizing that the Venetians would eventually gain control of the Aegean, seems to have engaged in a policy of *realpolitik* in order to retain a measure of influence in Cythera: he married his daughter to the Venetian lord of Crete, Marco Venier, including the island of Cythera in the dowry. In effect this marriage marked the beginning of the period of Venetian rule in Cythera.

The participation of the Venier brothers in the unsuccessful uprising of the lords of Crete against Venetian rule in 1363 – the so-called St Titius rebellion – prompted Venice to deprive the Venier family of all authority and to impose direct control on Cythera from Crete. Apart from a very brief period of Turkish occupation (1715–18), Cythera – referred to in the Venetian sources as Cerigo or the Isola di Venere – remained under Venetian control until the final fall of the Venetian

republic in 1797. Since then it has shared the fortunes of the Ionian islands.

Throughout the course of the Venetian period Cythera was divided into five administrative districts (*distretti* or *territori*): Fortezza-Borgo, Livadhi, Kastrissianika, Potamos, and Mylopotamos. Until the middle of the 16th century Cythera had three castles: Hagios Dimitrios, Kapsali, and Mylopotamos. The castle of Hagios Dimitrios, which guarded the Byzantine city of the Eudaimonoyannis family, was destroyed in 1537, after the invasion by Khayr al-Din Barbarossa. The district subsequently came to be known as Paliochora (Old Village), a toponym often used in the Greek language to indicate deserted villages or towns.

Two social strata developed on the island: the peasants (*popolani*) and the town dwellers (*cittadini*). The early centuries of Venetian domination in the island do not appear to have provoked substantial animosity or opposition, in contrast to nearby Crete. The long Venetian presence seems rather to have led to gradual convergence of habits and traditions.

After the Turkish conquest of Canea (modern Chania) and Candia (modern Herakleion) in Crete many families fled to Cythera, either settling there permanently and thus influencing many aspects of Cytheran life, or moving on from there to the Ionian islands of Zante or Corfu. Among those refugees from Crete were Frangiscos Salamon and his wife Anesina Podocataro, ancestors of modern Greece's national poet Dionysios Solomos.

CHRYSSA A. MALTEZOU

Summary

Lying off the south coast of the Peloponnese, Cythera was sacred to Aphrodite in antiquity. It was a source of *murex* (used to make purple dye), whence its alternative name Porphyrousa. After the fall of Crete (824) it was a haven for Arab pirates. Piracy declined after the Byzantine reconquest of Crete (961) and the island flourished. It was ruled by Venice from the mid-13th century until 1797. Since then it has shared the fortunes of the Ionian islands.

D

Dalmatia

Today a region of the Republic of Croatia, Dalmatia is the strip of land that hugs the indented eastern coast of the Adriatic from Zadar to the bay of Kotor, separated from the Balkan hinterland by the massif of the Dinaric Alps. A coveted region, which witnessed a succession of settlers, invaders, and conquerors in its history, Dalmatia was for several centuries a battleground for conflicting influences between East and West. Not surprisingly, its geographical position made it attractive to cultural forces emanating from across the Adriatic rather than the interior of the Balkans.

Named after the ancient town of Dalmion or Dalminion, the region was first populated by Illyrians. Scattered Greek settlements ensued. From the mid-2nd century BC the Romans extended their sway over a part of Dalmatia, but not until AD 23 did they definitively subdue its contumacious inhabitants and incorporate the region into the Roman province of Illyricum. Rome destroyed the ancient civilization of Illyria; still the latter gave Rome 13 rulers and defenders (*restitutores orbis*) of whom the emperor Diocletian (284–305) was the greatest. Latin was the language most commonly spoken, but Christianity had not much infiltrated the region by the time the capital was transferred to Constantinople. With the division of the Roman empire in 395, Dalmatia constituted the easternmost region of the western Roman state until it collapsed in 476.

Briefly dominated by the Germanic ruler Odoacer, and in turn overrun by waves of Ostrogoths, Dalmatia was restored to Byzantium in 535 in the reign of the emperor Justinian, at the start of his 20-year struggle to restore the empire to its ecumenical extent. A proconsular province, it was composed of the Istria–Kotor coast and the offshore islands. Throughout the migrations of the 5th and the 6th centuries people from the disrupted northern provinces of the state fled as refugees to the Dalmatian coastal towns.

Among the peoples who ravaged the Roman world, during the 6th century the Slavs, whose social organization was similarly embryonic, flooded the Danubian basin causing depredations in the Balkan lands. In Dalmatia, specifically, the massive influx of Slavs shattered the foundations of Christian culture, at that time under the supervision of the papacy, and ruined urban life; Salona and Epidaurus, the major coastal centres, were destroyed in the early 7th century. Yet, unlike the other barbarian tribes pursuing principally marauding purposes, the South Slavs firmly bound their lot with these provinces and established themselves as permanent settlers. Dalmatia acquired its Slavic ethnic character, and new centres – Ragusa (Dubrovnik) and Zara (Zadar) – in time replaced the ruined Roman ones. In fact, if credence is to be given to the writings of the emperor Constantine VII Porphyrogennetos (*De Administrando Imperio*), the South Slavs (Serbs and Croats) who infiltrated Dalmatia and other Byzantine regions did so with the agreement of the emperor Herakleios (610–41). They were allowed in as settlers to populate and defend the Byzantine borderlands, having first acknowledged the emperor's suzerainty. To Herakleios also is attributed the first attempt to Christianize the South Slavs.

In contrast to the confused background, and to the overall trend of urban decay characterizing Byzantine provinces after the Avaro-Slavic invasions, in Dalmatia intercourse between east and west favoured conditions for social organization. The region with its nearby islands remained a Byzantine province with its capital at Zara, administered by an *archon* (prior), probably a Byzantine dignitary or a local nobleman. But its ecclesiastical authority alternated between Rome and Constantinople; and in 732–33 the emperor transferred the spiritual jurisdiction of Illyricum (together with the southern Italian provinces of Calabria and Sicily) to Constantinople. This happened at a time when the iconoclast controversy was at its height, and Lombard and Frankish raids on the Italian peninsula caused an irreparable rift with Byzantium's European provinces. The Byzantine east emerged progressively as a clear-cut political and cultural entity following the collapse of Byzantium's sway over the greater part of Italy by 751. Yet Dalmatia's engagement with Constantinople's sphere was mainly political and never able to strike roots. The region's position on the Adriatic fringe of the empire and a lingering memory of its Roman-Latin heritage in the towns kept it culturally attached to Rome.

Charlemagne sought to extend Frankish sway over the Adriatic dominions of Byzantium, and, after he conquered Venice in 810, he subjugated Dalmatia, which was administered briefly by a Frank *dux Jaderae* (duke of the Adriatic). Although by the treaty of Aix-la-Chapelle (Aachen/Akyisgranon) of 812 Byzantine authority over Dalmatia was restored, it remained nominal. In practice Dalmatia was independent in the first half of the 9th century, and the South Slavic

tribes of the region established close bonds with their kindred in the Balkan hinterland who at the time were attempting to set up an inchoate political entity. But in the face of Arab raids on the Adriatic littoral, the Dalmatians called for Byzantine help. In response, the emperor Basil I, on ascending the throne in 867, sent the Byzantine fleet and recovered Dalmatia, which was organized as a Byzantine theme according to the new administrative system of the empire, already in existence in the European provinces since the 8th century. Ecclesiastically, it constituted a metropolis dependent on Constantinople.

Despite Dalmatia's integration into the Byzantine thematic system, especially under the centralist Macedonian dynasty, it remained one of the few exceptions enjoying a de facto autonomy, along with Venice and Cherson (in Crimea). At a time when most provinces saw their local immunities suppressed, Dalmatia retained its local privileges and municipal franchises, which ensured broad self-rule in the maritime urban centres. The theme of Dalmatia was placed under the administration of a Byzantine general, but the towns had their local notables and dignitaries. This status was further strengthened by a renewed flourishing of urban and commercial life in the empire, which had been suspended in the wake of the Avaro–Slavic disarray. Byzantine overlordship in the Dalmatian theme steadily diminished to a nominal authority. By 880 Croatian Dalmatia, extending southwards as far as the Cetina river, freed itself entirely under prince Branimir from Byzantine control. Along with a spirit of urban autonomy, most of Dalmatia became increasingly receptive to non-Byzantine influences, namely Croatian and Venetian.

Dalmatia was still recorded as a Byzantine theme in the 11th century, shortly after a revision of the Byzantine administrative system took place in the Balkan provinces; but the region itself was irretrievably lost to foreign administrations in later medieval times. The Byzantine presence was principally threatened by the ascendancy of Venice as a maritime power, and by the strong Croatian state, reaching as far down the Dalmatian coast as the Neretva river in the mid-11th century. Croatian control of Dalmatia from the time of king Tomislav (*c.*910–28), and a short-lived Venetian domination around 1000, already marked the decline of Byzantine influence. The latter, apart from being politically diminished, was culturally displaced by the Latin Church, whose bishops in the Dalmatian towns were encouraged by the Croatian rulers to ensure Dalmatia's incorporation into the sphere of Roman-Latin culture. Soon the role of Byzantium was eclipsed, despite an ephemeral restoration in the reign of the emperor Manuel I Komnenos (1143–80) who pompously assumed the title "ruler of Dalmatia". With Manuel's death Bela III of Hungary (1172–96) subjugated all the Byzantine possessions in the region.

In the 13th–14th centuries Dalmatia experienced complicated changes of overlord; characteristically, at one stage the southern half belonged to Serbia, the northern to Croatia-Hungary, the Adriatic islands and littoral sites to Venice, and Ragusa (Dubrovnik) constituted an independent city state. In cultural and economic terms this territorial fragmentation was tantamount to Dalmatia's irrevocable transfer to the Roman-Latin sphere. Even within the medieval Serbian state, whose Orthodox rulers may have grown politically combative but remained culturally receptive to Byzantium's civilizing impact, Serbian Dalmatia represented a channel of Latin influence, which included Italian art. The long Venetian-Hungarian rivalry over Dalmatia, which spanned three centuries, culminated in the victory of Venice in the early 15th century.

In early modern times, when Ragusa emerged as a flourishing maritime republic, Greeks and Dalmatians came into close contact since Ragusan ships traded at Greek ports, and also as naval crews in the ships of Venice.

Historically, Dalmatian culture was heavily characterized by Italian influences, both Latin and Renaissance, but blended with a native Slavic element. Greek-Byzantine culture had a markedly secondary impact, though archaeological and architectural evidence bears witness to its presence. Diocletian's magnificent palace in Split (Spalato), a site already occupied by a Greek settlement (Aspalaton), was erected by builders invited from the East who echoed eastern palace architecture. More evident is the early Christian architecture, the basilicas of the 6th and 7th centuries. Later, Andrija Buvina, a great sculptor of the 13th century, drew partly on the Graeco-Roman heritage and the Byzantine tradition in creating his well-known reliefs on the doors of Diocletian's Mausoleum in Split. In Dalmatian literature, Classical Greek lyrics inspired some poets in Dubrovnik through Italian humanism, such as Dinko Ranjina (1536–1607) who in his lyrical poetry imitated Moschus and Theocritus. Lastly, Romano-Byzantine law had a remarkable effect on the statutes of the Dalmatian coastal towns and islands, which outlived Byzantine rule in Dalmatia.

Summary

Dalmatia is the eastern shore of the Adriatic Sea from Zadar to the bay of Kotor. Isolated Greek settlements were made from the 6th century BC but the region was Latinized by the Roman conquest. Restored to Byzantium in 535, Dalmatia remained a Byzantine province until the 11th century. Venetian influence was strong thereafter.

Damaskinos, Michael *c.*1530–*c.*1592

Painter

Michael Damaskinos was an important figure in the 16th-century renaissance of Cretan painting. He appears to have been born in Candia (Herakleion), the flourishing capital of Crete under Venetian rule, where previous generations of painters had established a solid artistic tradition. He certainly served his apprenticeship there, possibly with a painter of the circle around Theophanis Strelitzas-Bathas, and produced his first mature works between about 1555 and 1565.

A bearer of the Byzantine painting tradition, Damaskinos was also receptive to new trends in western European painting. Following the example of his fellow Cretan Domenikos Theotokopoulos (El Greco), he went to paint in Venice, at a time when some of the most brilliant Venetian painters (most notably Titian, P. Veronese, Tintoretto) were at their height. In Venice he signed a contract in 1569 to work for two years in Sicily. From 1574 to 1582/83 he was again in Venice. Working within the Greek Orthodox Confraternity of Venice (of which he was a member, with contributions registered in the years 1577–82), he painted icons for the church of San Giorgio dei Greci, many of which are still in situ today, in the sanctuary and on the iconostasis. On two occasions he sought election to the council of the confraternity, but without success. During these years he also worked for Catholic institutions and executed private commissions. In Venice he made the acquaintance of the sculptor Alessandro Vittoria, to whom, in 1581, he sold a collection he had amassed of drawings by Italian artists, particularly by the Mannerist Parmigianino. He also met the painter Palma Giovane and probably had some contact with the workshop of Tintoretto, whom he followed in some of his works.

When he returned to Candia (1583) he gave his only daughter Antonia in marriage to the painter Ioannis Mavrikas-Mandouphos and continued his professional career in a climate of general appreciation of his work but also, paradoxically, of financial difficulties. He undertook a variety of commissions and produced some of his finest works, now in Crete and Corfu. In 1588 he was invited most insistently by the Greek Orthodox Confraternity of Venice to return and paint the dome of San Giorgio dei Greci, but declined the invitation, citing family and financial reasons. The last references to his activities date from 1591, and he probably died in 1592, while still at a productive age.

The unconfirmed tradition that Damaskinos became a monk in the Vrondisiou monastery in the province of Kainourio in the southwest of the prefecture of Herakleion seems to derive from the fact that there was formerly a series of six icons by him in the monastery (now in the collection of St Catherine of the Sinaites, Herakleion). As a painter, he was much in demand during his own time, both in Crete and elsewhere. He also gained considerable posthumous fame: Panayiotis Doxaras, the painter and theorist of early modern Greek painting, in his *Art of Painting* (1720), considers Damaskinos to be one of the most important Greek painters.

Works by Damaskinos are to be found in many parts of Greece (Mount Athos, Athens, Corfu, Crete, Galaxidi, Patmos, and Zakynthos) and the rest of Europe (Italy, Switzerland, for example), on Mount Sinai, and in private collections in the United States. According to recent estimates, his known works amount to about 100. More than half are unsigned but are securely attributed to him on the basis of historical evidence or stylistic criteria; conversely, several works that falsely bear his signature have been removed from his oeuvre. Only two of his works bear a date: the *Beheading of John the Baptist* (1590; Municipal Cemetery of Corfu) and the *First Ecumenical Council* (1591; St Catherine of the Sinaites, Herakleion). A few more, executed in Venice, may be dated on the basis of archival evidence. In most cases, however, it is difficult to date Damaskinos' work, particularly since his style exhibits considerable differences, often during the same period.

The demands of his profession and the broad spectrum of his clients in Greece and Italy (Orthodox and Catholic churches and monasteries, private individuals of both creeds and from all social classes, Venetian noblemen, and Cretans from the lower and middle classes) undoubtedly influenced his work. His output was always of a high standard and exhibits great variety in terms of the genre, technique, style, and iconographic schema. He executed large-scale works for public places of worship and monasteries (despotic icons, iconostases for churches, and western-type altarpieces), and also small

icons and triptychs designed for private piety. With unrivalled skill, he created individual devotional figures of saints in an imposing monumental style, and also complex narrative scenes of a miniature character. A large number of his works are in a traditional style, based on late Palaeologan models and Cretan painting of earlier generations. He never rejected this style, though towards the end of his career he added to it a distinct element of plasticity and a barely perceptible misty chiaroscuro. Many of his works also reveal the influence of western European art, sometimes confined to details, and sometimes more pervasive, using as models foreign Renaissance and Mannerist paintings and engravings. They retain a unity of style, however, thanks to the use of a single medium (normally traditional egg tempera, probably with an admixture of oil), and a uniform range of colours.

From a technical point of view, Damaskinos generally showed a preference for a brown underpaint, using pinkish flesh tones with a few greenish shadows, and lighting prominent points of exposed flesh with discreet white brushstrokes. Drapery sometimes retains the geometric character and rhythmical arrangement of early Cretan painting and sometimes acquires the soft folds and fluidity associated with western taste. The predominant colours in his work are red and green, with a rich tonal scale ranging from pale rose-red to deep purple, applied in successive thin layers.

In works whose iconography is of purely western origin Damaskinos adopted the appropriate style, strongly influenced by Titian and Tintoretto. It is to these painters that his preferences incline, along with others of the Venetian school, such as J. Bassano and P. Veronese, and other central and north Italian painters of the High Renaissance and Mannerist periods (Raphael, known mainly to Damaskinos through engravings by Marcantonio Raimondi, Parmigianino, and Andrea Schiavone), and more rarely from northern Europe. For a single work he gleaned elements from different sources, rarely copying figures or groups in their entirety.

Damaskinos's artistic aspirations find tangible expression in compositions which, while retaining their Byzantine core, distance themselves from the established schemes of that tradition. This results in multifigural works, with the main subject framed by other related episodes executed in miniature, revealing his assimilation of western influence. These works, which exhibit some originality with regard to the tradition in which they are set, and justify the painter's signing them with the word *Poiema...* (Creation of...) instead of the traditional *Cheir...* (Hand of...), are in accord with the mixed nature of Cretan society in the Venetian period. The most important of them are the six icons now in the collection of St Catherine, Herakleion, and a number in Corfu.

Among the artist's innovations, particular interest attaches to the use of linear perspective (an issue of serious concern to Renaissance art theorists and painters), the use of genre elements rendering details from everyday life, the incorporation of Renaissance features and semi-naked bodies of Mannerist taste, the correct perspective rendering of objects, architectural decoration, and the contorted *figura serpentinata*. Some of his works also reflect the concerns of the day, such as debates on doctrinal issues.

Damaskinos made a highly important contribution to the renewal of the traditional iconography of post-Byzantine painting. Many of the new iconographic compositions that he created were copied by known 16th- and 17th-century painters, such as Emmanuel Lambardos, Victor, Frangiskos Kavertzas, Philotheos Skouphos, Emmanuel Skordilis, Ioannis Moskos, and others – and also many anonymous painters. Though they fall short of the quality of their models, they indicate the esteem in which Damakinos' work was held by his fellow artists and the wide circulation of his drawings. With their excellent quality, their original treatment of their subjects, and the strong physical presence of the figures depicted, his works are also used as models by modern religious painters. Indeed, given the vast increase in the publication of books illustrating original icons in recent years, as well as a new interest in icon painting, they are now being copied more frequently than ever.

MARIA CONSTANTOUDAKI

Biography

Born *c.*1530 in Herakleion (Candia), Crete, Damaskinos served his apprenticeship in his native city, perhaps under a painter of the circle of Theophanis Strelitzas-Bathas (Theophanes of Crete). He moved to Venice in the 1560s and with a two-year break in Sicily stayed there until *c.*1582, working mainly for the Greek Orthodox Confraternity. In 1583 he returned to Herakleion and continued to paint. About 100 of his works are known. He died probably in 1592.

Dance

From the evidence of both literature and art, it is clear that in ancient Greece dancing – the art traditionally dedicated to Terpsichore, one of the Muses – was widespread and important, whether as part of private entertainment or public ceremonial. Attendance at dancing classes in the tribal divisions of society was an obligatory part of the education of young Athenians. Spontaneous or formalized dancing in groups, usually of the same sex (since many ritual occasions demanded segregation of the sexes), and solo dancing of an expressive or imitative nature, with attention to movements of the hands (*cheironomia*), are both well attested; but, surprisingly to us, dancing together in pairs of opposite sexes, as in western ballroom dancing, seems to have been quite unusual.

In the description of the scenes on the shield of Achilles in *Iliad* 18, however, youths and maidens dance in adjoining lines, accompanied by two tumbling acrobats, and the dance floor is compared to the one made by Daedalus for Ariadne at Knossos. Crete was in fact thought to have made the major contribution to the development of dance, going back to the very birth of Zeus, when the leaping, foot-stamping, and weapon-clashing of the Curetes, fertility demons, concealed the child from the cannibalistic intention of his father Cronus. A late fragmentary hymn describing the occasion, with the theme of leaping to promote fertility, was found in excavations at Palaikastro. The lively dance called *hyporchema* was also believed to have been a Cretan invention, and was occasionally introduced into the choreography of Classical Attic tragedy. Plutarch (*Theseus*, 21) also describes a dance called *geranos* ("crane"), said to have been danced by Theseus and other youths on their escape from the labyrinth of Minos, and the agility in battle of a minor warrior of the *Iliad*, the Cretan Meriones, was attributed to his dancing skill.

The association of dancing with warfare – called "fierce Ares' dance" in *Iliad*, 7. 241 – and the manipulation of weapons are highlighted in the so-called Pyrrhic dance, also said to have derived from a divine birth, this time not of Zeus, but from his head, when Pallas Athena leapt out vigorously, fully armed. The motif of the dramatic emergence of a warrior continued to be a feature of the Pyrrhic, which was performed particularly at the Panathenaic festival by youths, naked but armed with helmet, shield, and spear, like the goddess. Socrates (Athenaeus, 628f.) is said to have declared that "those best at dancing are also best at war", and Plato (*Laws*, 815) described how this dance imitated defensive and offensive postures of combat. The Pyrrhic was alternatively attributed to Achilles' son Neoptolemus (also called Pyrrhus), whose desperate self-defence against Delphians is likened to the dance in a memorable passage of Euripides' *Andromache* (1129ff.). Aristophanes (*Clouds*, 988–89) complained that the effete younger generation in Athens could not adequately perform the shield-twisting movement in honour of Athena, and it seems that a sophisticated stereotype in the dance might replace the actual shield, with a folded cloak covering the left arm to mimic the true armed pose. The Pyrrhic is the dance most often represented in art, both in sculpture and in vase painting. A pose showing sideways or backward turning of the head is another motif, sometimes associated with another exploit of Athena, when she instructed Perseus how to avoid the fatal glare of the Gorgon in their famous combat, or even herself performed the slaying of the monster. Armed dancers were popular elsewhere in Greece, especially Sparta with its prominent tradition of military training, and an elaborate account by Xenophon (*Anabasis*, 6) gives a detailed description of these in entertainments provided by different Greek mercenaries during Cyrus' famous march through Asia Minor. Included are a Persian dance featuring crouching and jumping, and one named *karpaia*, in which a farmer takes arms to protect his property against rustlers. The Pyrrhic is here danced as a solo by a young girl.

In *Laws* 815 Plato declares that there are two desirable types of dance, the warlike (as described above) and the peaceful, among which the stately and graceful *emmeleia* is singled out. *Iliad* 16. 183 refers to maidens dancing in the choir of Artemis, and a feature of Attic ritual was the chorus of young girls dressed as bears dancing in her honour in the township of Brauron. Dances imitative of animals and birds were widespread throughout Greece. When Odysseus is entertained at the Phaeacian court (*Odyssey*, 8. 256) he watches a pair of local youths dance, where jumping and throwing balls to each other are featured. The maiden songs (*partheneia*) with choral dancing of Alcman were notable, often celebrated at a night festival (*pannychis*). *Paeans*, mostly associated with Apollo, were composed by poets like Pindar, along with processionals (*prosodia*), marriage songs (hymeneals, epithalamia), dirges (*threnoi*), and the victory odes (*epinicia*) for which he is most famous. Ecstatic dancing was a feature of the cult of Dionysus and his crazed maenads (most memorably featured in Euripides' *Bacchae*). Other deities of oriental origin, such as Cybele, Attis, Sabazius, and their acolytes the Corybants, were also worshipped with the sort of dancing to musical accompaniment performed by ecstatic votaries which aroused apprehension about the disruption of civic order in some communities.

The dance particularly honouring Dionysus was the dithyramb. Whether Aristotle was right to see Attic tragedy (certainly associated with that god, and performed in his theatre) as developing from the dithyramb remains controversial, and the latter continued to be danced independently in a circular group of 50 in inter-tribal competitions, while the tragic chorus was danced in more formal rectangular patterns of 12 or 15 performers. Having entered by the *parodos*, they performed in the dancing place (orchestra) and remained on stage during the acted portions which were punctuated by their stationary songs (*stasima*), before marching out, usually to an anapaestic rhythm, in the *exodos*. Sophocles was himself said to have been an elegant dancer, and to have written a handbook *On the Chorus*. The group of three tragedies (trilogy) was followed by a satyr play, where the chorus, sometimes in

Dance: female dancers depicted on a *krater* in the Museo Archeologico Nazionale, Ferrara

the guise of attendants of Pan or Silenus, indulged in grotesque parodies of the statelier tragic dances, and we hear too of frankly indecent dances like the *sikinnis* and *kordax*. The chorus in Aristophanes' comedies performed the energetic dances appropriate to revelry (*komos*). Dancing was a popular feature of symposia in Athens and elsewhere, and Xenophon's *Symposium* in particular describes a typical party. Courtesans (hetaerae) were frequently called upon for these entertainments, with the music of the double *aulos* and castanets.

When Greek culture began to penetrate southern Italy, the so-called *phlyakes* plays, of similar hilarious type, became popular, and the dances that accompanied them are represented on vases. It was in the Roman era that the craze for virtuoso dancing by Greek *pantomimi*, interpreting different mythical roles, not only spread in theatrical performance, but attracted the favour of the imperial courts. Nero's own patronage of dancing, and his taking the stage himself, were notorious. Moralists and satirists such as Cicero, Seneca, and Juvenal may have expressed their disgust at the lewdness of much professional dancing, and in the Christian era the suppression of such exhibitions was sought. Nevertheless in the 6th century the notorious dancer Theodora became Roman empress through her marriage to Justinian.

In the pantomime the same dancer acted out a series of roles, representing either sex, and changing masks accordingly, with the mimicry of a dumbshow in steps, postures, and gestures. Although in the Byzantine period stage performance declined, pagan festivals and carnivals such as the Kalends and Brumalia survived and continued to be celebrated, while more decorous dances were performed at weddings and court ceremonials. In spite of theatrical censorship, low-class dances were still to be seen in taverns, accompanied by wind instruments and percussion.

The popularity of mythological themes in French *tragédie lyrique* and opera-ballet in the 17th–18th centuries revived interest in Greek theatrical dancing. A notable example of a famous Attic tragedy restaged (in translation) in the following century was Mendelssohn's *Antigone* at the Prussian court in Potsdam in 1841. Though it was a great success, when it reached London four years later, *Punch* magazine reviewed it with facetious contempt for the costume, singing, and dancing of the chorus! A century later, staging Attic tragedy attracted the attention of Carl Orff. His *Antigonae* (which has been performed in the Athenian theatre of Dionysus) and *Oedipus der Tyrann* were set to German translations, but his later *Prometheus* was staged to Aeschylus' Greek text.

In modern Greek society, folk dancing is ubiquitous, with dances such as the *tsamikos*, *zeibebiko*, *hasapiko*, *kalama-*

tianos, and *syrtos* – a dance actually attested as early as the 1st century. In the 20th century attempts have been made to reconstruct for performance elements of what is known of ancient Greek dance from art and literature (especially Lucian's essay *On the Dance*); and mention could be made of the eurhythmic movement of Jaques-Dalcroze and the dancing of Isadora Duncan, who derived ideas from depictions of dancing in Greek art, and of Martha Graham. Now that the staging of Greek drama, either in the original Greek or in translation, has been revived, and performances are more frequent – those by the Greek Art Theatre of Karolos Koun, and the London Festival of Greek Drama have been successful, and even the stylized Japanese theatre has turned attention to Greek tragedy – producers have come to decisions as to how best to represent the choral interludes and dances of the ancient theatre.

Dark Age 1200–700 BC

The term "Dark Age" is a relatively recent coinage of modern scholarship, applied to the period that intervenes between the collapse of the Mycenaean palaces around 1200 BC and the emergence of a new state form (the polis) in the course of the 8th century BC. Ancient writers seem to have been unaware of any major disjuncture between the heroic age and the historical period. Hesiod, writing around 700 BC, paints a gloomy picture of a gradual decline, symbolized by the successive "five ages" of gold, silver, bronze, heroes, and iron (*Works and Days*, 109–76). Conversely, Thucydides' conception of early Greek history (1. 1–18) is predicated on the notion of a steady evolutionary growth of resources and power; although the period immediately following the Trojan War is characterized by instability and migration (1. 12), there is no real sense of a cultural or economic "trough" that stands in stark contrast to conditions before the Trojan expedition, nor again of a "renaissance" associated with the rise of the polis – in fact, most Greeks believed that poleis had existed from time immemorial.

Up to the 1870s, most scholars accepted – at least in principle – Thucydides' general schema of early Greek history, though many (George Grote in particular) believed that the lack of contemporary written evidence made it impossible to construct a properly historical narrative of Greece before 776 BC (the traditional date for the foundation of the Olympic Games). However, Heinrich Schliemann's excavations at Troy (1870–90), Mycenae (1876), and Tiryns (1884) made it clear for the first time that an earlier, civilized culture had flourished on the Greek mainland; it also soon became evident that the palaces associated with this "Mycenaean" civilization had experienced an abrupt end. Following Flinders Petrie's publication in 1890 of Mycenaean pottery in Egyptian contexts of the 18th and 19th Dynasties and his conclusion that the Mycenaean palaces had been destroyed around 1200 BC, it became evident that there was a gap of approximately five centuries between the collapse of the palaces and the first extant literature as represented by Hesiod and the lyric poets of the 7th century BC. The sheer paucity of evidence for this intervening period had already by the last decade of the 19th century led historians to term it a "Dark Age" or "the medieval epoch of Greece".

It is sometimes stated today that the Dark Age is simply a "subjective" perception in the mind of the modern historian, generated by the lack of any contemporary literary evidence, and that archaeological investigation is revealing the period to be anything but obscure in "objective" terms. In fact, if anything, the opposite is more correct. It is certainly true that direct and contemporary literary evidence is lacking for the period. The Linear B tablets, which offer precious testimony for economic, social, and military conditions in the Late Bronze Age, disappear with the destruction of the Mycenaean palaces as the bureaucratic necessity for scribal literacy evaporated; literacy – this time in alphabetic form – is not attested again in Greece proper until the middle of the 8th century BC (though a possible example of the Greek script of the early 8th century BC is claimed at Osteria dell'Osa to the east of Rome). Nor has Moses Finley's argument that the Homeric epics reflect the social conditions of the 10th and 9th centuries BC

met with much scholarly consensus. Nevertheless, while recent decades of archaeological exploration have certainly served to illuminate our knowledge of the Dark Age and to trace certain low-level continuities throughout these centuries that should urge caution against too rigid a periodization, it is still the case that our increased understanding of this period ultimately confirms that settlement patterns, interactions between communities, religious behaviour, and artistic and technological traditions were indeed somewhat different from the situations that had existed earlier and were to exist subsequently.

The collapse of the Mycenaean palaces seems to have instigated certain population movements, revealed by the occupation of new areas such as eastern Attica, Lefkandi on Euboea, Emborio on Chios, Ialysus on Rhodes, Cyprus, and the north Aegean. Yet many of these sites were short-lived and by the first half of the 11th century BC the number of known settlements in Greece is less than half the 220 sites attested for the period 1200–1150 BC. This may indicate overall demographic decline but there is also the possibility that new sites were occupied on a more temporary or seasonal basis (thus potentially escaping archaeological retrieval) and it is often suggested that instability and insecurity were both the cause and effect of a shift from sedentary agricultural practices to a more pastoral lifestyle. From the 10th century BC the number of known sites begins to rise again but it is not until the 8th century BC that a sharp increase in site numbers and evident signs of urban nucleation signal a return to more settled conditions – a phenomenon that may have been triggered by, but would certainly help to foster, demographic growth.

The communities of this period were also far more isolated than had been the case earlier when the Mycenaean cultural koine had embraced much of the Mediterranean and the Near East littoral; one apparent indication of this new isolation is the increasing regionalization of pottery styles. Nevertheless, not all contacts were severed entirely: imported grave goods are still attested – albeit in smaller quantity – at sites in both central and southern Greece, while the diffusion of iron metallurgy should suggest some continued contact with the east – almost certainly with Cyprus as an intermediary. Crete in particular maintained links with Cyprus and possibly even Italy and Sicily. One of the most important "type-sites" for the period is Lefkandi on the island of Euboea where, from the 1960s onwards, excavations have brought to light part of the settlement (whose ancient name is unknown) and its cemeteries. The mid-11th-century BC tombs at Lefkandi contained artefacts from Cyprus and the Levant, though there followed a period of apparent isolation until the middle of the 10th century BC, when an imposing peripteral building, constructed from timber and mudbrick and erected over a "princely" burial, testifies to the emergence of a hierarchy within this newly prosperous (but still fairly small) community. Immediately afterwards the building was surrounded by a number of elite burials whose grave goods indicate renewed contacts with Athens, Thessaly, Macedonia, Cyprus, and the Near East. It is fair to say, however, that Lefkandi is very much the exception to the rule: at other Greek sites it is generally not until the 9th and 8th centuries BC that more distant links are resumed as a prelude to the colonization of the west.

While the appearance of many recognizably Greek divinities in the Linear B tablets points to some continuity in religious traditions, archaeological evidence that might suggest a continuity in ritual behaviour is more elusive. A few sites certainly attest a continuity of cultic enactment from the late Mycenaean period throughout the Dark Age (Kalapodi in Phocis, Kato Syme Viannou on Crete, and possibly the Polis Cave on Ithaca), and several sanctuaries were already functioning by the 10th century BC (Munychia, Brauron, and Mount Hymettus in Attica; Olympia and Kombothekra in Elis; Amyclae in Laconia; the Heraion on Samos; Tegea in Arcadia; and Isthmia in Corinthia), but there is little or no evidence for cultic activity much before the 8th century BC at some of the more famous sanctuaries of the historical period, such as Eleusis, Delos, and Delphi, and this is also the period that witnesses the earliest cultic buildings, even in sanctuaries that had been functioning for several centuries.

Finally, the period witnesses the disappearance of certain technological and artistic traditions such as ivory working, figured pictorial representations on pottery, and monumental stone architecture. It is the apparently seamless resumption of these techniques from the 9th and 8th centuries BC onwards that has suggested to some scholars that the Dark Age is nothing other than a scholarly mirage, produced as a result of synchronizing the Mycenaean ceramic sequence with faulty Egyptian dates; it has been argued that a recalibration of the Egyptian sequence yields a destruction date for the Mycenaean palaces of 950 BC rather than 1200 BC, thus halving the five-century "gap" that troubled earlier scholars. The thesis has little to recommend it, though it provides a salutary reminder as to the fragility of pottery chronology in the ancient Mediterranean and Near East.

JONATHAN M. HALL

See also Political History to 490 BC

Summary

The period from the destruction of the Mycenaean palaces *c.*1200 BC to the emergence of the polis as a state form *c.*700 BC. Archaeological evidence of settled communities and cultic activity is slight before the 8th century BC. Traditions of ivory working, figured decoration on pottery, and monumental stone architecture disappeared. Type-sites such as Lefkandi testify to the isolation of the society.

Dead, Cult of the

Although Homer represents the dead in Hades as devoid of physical and mental power, and Hesiod credits the disembodied spirits of the golden race with being altruistically beneficent, the common Greek belief was that the behaviour of the dead was influenced by the conduct of the living. They behave beneficently when propitiated, but maleficently when neglected or spurned. Being capable of doing good or evil, they had to be gratified with pious attentions in order to induce them to do good. Accordingly, a ritually correct burial or cremation, costly grave gifts, and periodical offerings of food and drink were vital elements in the tendance of the dead.

The history of the Greek cult of the dead is to some extent related to the prevalence of the two chief modes of disposal, namely cremation and inhumation, although they do not reflect different eschatalogical beliefs. Whatever the method of disposal, it was essential to cover the body with earth, and three handfuls were sufficient to fulfil the requirements for a ceremonial burial. Thus in Sophocles' *Antigone* (255–56) the heroine scatters a thin coating of dust over Polynices. This covering cut the dead off from the sight of the heavenly gods, to prevent them from being offended and their altars polluted (cf. Sophocles, *Ajax*, 589, *Antigone*, 1716f.). It was also an act of kindness to the departed, because they could not enter the underworld unless their mortal remains were buried (Homer, *Iliad*, 23. 71ff.). To grant burial to a dead person, be he friend or enemy, was therefore universally recognized as a pious act. However, burial was denied to executed criminals, traitors, and occasionally to suicides.

When the body had been bathed, it was dressed in clothes such as the deceased might have worn in life, and laid on a couch (*prothesis*). Laments were made by the relatives and others present, and moderation in this respect (as well as in the elaborateness of funeral pyres and the amount of grave goods buried or burned with the body) was recommended, and sometimes required by law. Finally, the body was carried to the place of burial or cremation accompanied by a crowd of mourners (*ekphora*). Only the *prothesis* and *ekphora* are depicted on geometric vases, but the Athenian white-ground lekythoi frequently depict tomb cults. In the case of cremation, the ashes were placed in a vessel whose shape, size, and material varied according to place, time, and circumstances. Coffins were normally used for burials, while elaborately carved sarcophagi became fashionable among the well-to-do in later times. It was customary to hold a funeral even in the absence of a body, and dummies may have been used occasionally. Family rituals for the dead were held at the tomb not only after the burial, but also at intervals thereafter.

Although Minoan and Mycenaean tombs show variations in size, elaboration, and the number and value of their grave offerings, we know little or nothing of their funerals. Homer describes elaborate funeral ceremonies, such as those in honour of Patroclus in *Iliad* 23. The funeral was followed by elaborate games in which every contestant received a prize of some sort. Some of these were the property of the dead person, and it has been suggested that the prizes may represent a compromise between burning all the dead man's goods with him and allowing them to be inherited. During the Archaic period the funeral became an occasion to display aristocratic wealth, power, and prestige, and laws were passed to limit extravagance.

Greek literature frequently refers to the need for burial rites and the insult to human dignity if they are omitted. Though the dead themselves had no power, they had access to infernal powers, notably Hades and Persephone. Accordingly, *katadesmoi* or folded lead plaques inscribed with curses bearing the name of the person to be "bound down" were occasionally placed in graves. The dead person's journey to the next world was effected by elaborate ritual conducted by relatives, primarily women. Priests were not allowed at funerals for fear of incurring pollution, and there was no "burial service" as such. No tomb cult was practised in early times, but in Classical Athens women paid regular visits to the grave. Offerings included cakes and libations, mainly of pure water. Aeschylus has dramatized such visits in the *Choephori* and the *Persians*, but with differences of time and place. It was considered so important at this time for the dead to receive the attention of the living that it constituted a reason for adopting an heir (Isaeus, 2. 36. 7, 30).

From Classical times we have descriptions of magnificent public funerals (complete with orations honouring the dead), especially those given at Athens to citizens killed in war (Diodorus Siculus, 11. 33. 3; Thucydides, 2. 34). Their magnificence is matched by the sculptured gravestones of Classical Athens with their restrained expression of grief. The dead are often depicted performing some familiar act for the last time. The brief inscriptions usually record only the name and parentage, and sometimes the word "farewell" is added. Those who died unmarried at marriageable age received special sympathy, their pathos being underlined by a stone grave marker in the form of a *loutrophoros* or vase used in the nuptial bath. According to Plutarch (*Aristides*, 21), the heroic dead were so powerful that even in his own day (*c.*AD 46–*c.*120) they received blood sacrifice. Those who visited a funeral underwent some defilement, so water from another house was provided on leaving for cleansing: see Hesiod's advice not to make love on returning from funerals. Cypress branches were fixed to the door to indicate a death within.

Sacrificial offerings were made to the dead from the time of the burial and at the grave. Solon expressly forbade sacrifice of oxen at the grave. Burial was followed by a funeral feast. The soul of the dead man was thought to be present, even to be the host. On the third and ninth days after the funeral, meals were given to the dead man at his grave; the ninth day ended the period of mourning (in Sparta the eleventh). On the fifth day of the month of Boedromion a general *genesia* (birthday) was held by the entire Athenian public for their dead relatives; we also hear of a feast called *nemesia* probably to avert their anger.

At Athens the chief festival was held at the close of the Dionysiac feast of the Anthesteria, in spring, of which it formed the concluding day. On this day the dead swarmed back to the world. Each family made offerings to their own

dead. Hermes, on behalf of the dead, was offered cooked vegetables and seeds in pots (hence the name Chytrai). After the feast the souls were asked to leave.

We learn from Plato (*Republic*, 2. 365a) that during the 4th century BC there were many Greek manuals attributed to Orpheus, Musaeus, and other sages, full of mythology and formulas for initiations. They also contained instructions for calling up the dead for consultation, Hermes being the intermediary. Such formulas are also found in the magical papyri.

In spite of philosophical discussions on reincarnation and the transmigration of the soul, it is strange that such views have left hardly any trace on Greek tomb inscriptions: there are no prayers for a better life at the next birth or for a safe return to old haunts. The doctrines of the religious and philosophical teachers in this regard apparently had little influence on the life and thought of the common people.

Quite different was the case of the Christian teaching of a purgation of the dead, as borne out by Paul's discovery that at Corinth some Christians were undergoing a second baptism on behalf of dead relatives (1 Corinthians 15:29). Similarly, Byzantine Christians, believing in the power of the living to influence, through prayers and intercessions, the destiny of the souls of the departed, made lavish donations to churches and monasteries in order to guarantee the proper commemoration of their dead relatives.

Death was viewed by both Christians and Neoplatonists as a liberation from captivity. Nevertheless, both laid greater emphasis on the positive aspect of death as the beginning of a new life. Loud and excessive mourning over the dead was therefore criticized by theologians such as Basil the Great and John Chrysostom, while some radical monastic circles even objected to a special burial service.

Christianity transformed in a special way the rites of the funeral liturgy and certain representations of the hereafter that derived from pre-Christian customs and beliefs. Among the beliefs thus taken over and transformed by the Church Fathers were the soul's journey after death escorted by the *psychopompoi*, a role now ascribed to the angels; Charon's ferry, whose role is now taken by the Church – the ship of souls; the *ephodion* or sustenance for the journey, now provided by the Eucharist or "Holy Viaticum". This last concept is sometimes given a wider meaning to include faith, baptism, or the monastic life. Meanwhile, the traditional funeral meal conducted by relatives at the tomb of the deceased gave rise to the custom of distributing *kollyva* (small round cakes). This practice was unanimously opposed by the Western Church as a pagan superstition, but it survived in the Byzantine Church. The 3rd, 7th (or 9th), and 30th (or 40th) days after death were specially commemorated by the distribution of *kollyva* and the offering of liturgical prayers, which were thought to accompany the dead person on his or her journey, these dates being regarded as marking important stations on the soul's journey either to the final vision of, or banishment from, God. The dead were also commemorated on the anniversary of their death and on the Saturday before Meatfare Sunday.

Death

In ancient Greece death was an everyday occurrence, being prevalent among people of all age groups whether as a result of disease, accident, childbirth, or warfare. Furthermore, it was a far more immediate aspect of the life of the community than is the case in many modern societies. Since there were no hospitals, most deaths occurred either at home or on the battlefield. If death occurred at home, it was the duty of the relatives of the deceased to prepare the body for burial, transport it to the burial ground, and lay it in the earth. Since funerals provided an opportunity for the display of wealth and prestige, many communities, including that of Athens, introduced legislation designed to limit their scale and magnificence.

The most striking evidence of burial practices in Bronze Age Greece is provided by the so-called shaft graves at Mycenae. These graves, dated to the 16th century BC, are cut into the living rock to a depth of several metres. They have yielded some of the richest finds ever discovered on the mainland. In the 15th century a different style of burial developed, in the form of beehive tombs, so named because of their domed appearance. Recent excavations at Lefkandi on Euboea dating to the 10th century BC have yielded evidence of the ritual slaughter of a young woman and four horses on behalf of a warrior, presumably so that they could accompany the warrior to the underworld.

In Homer death is characteristically described in terms of the departure of the psyche "lamenting its fate", from either the mouth or a gaping wound. However, it is worth noting that, of the 240 deaths in the *Iliad*, only four are described in this way. The psyche is, moreover, a biologically indistinct entity which is rarely referred to except at the moment of death. No other Greek writer gives any explanation as to why the human organism dies, except for Aristotle, who claimed that it was caused by loss of vital heat. Mythologically the idea of a painless death was epitomized by the gentle arrows of silver-bowed Apollo.

Because a corpse was believed to be highly polluting, relatives were required to take elaborate precautions to prevent the pollution from seeping out of the house and into the community. Solon legislated that only close family members and women over the age of 60 were permitted to enter the house of the dead and take part in the funeral. In order to contain the pollution, a bowl of water was placed outside the house so that visitors could purify themselves, and flasks containing olive oil were placed around the couch on which the dead was laid out. In addition, a cypress branch was hung on the door to warn passers-by of the presence of contagion within.

Death was handled almost exclusively by the relatives of the deceased, who were under a sacred obligation to ease transition "from here to there", as the Greeks phrased it. Though there are occasional references to undertakers in ancient sources, their duties were confined to transporting the corpse from the house to the grave and preparing the ground for burial. It is a reasonable assumption that the Greeks would have regarded the idea of handing over the corpse of a dead relative to strangers as both incomprehensible and inexcusable. This had much to do with the belief that in the period between death and burial the deceased was in a dangerous liminal condition and needed help from his or her relatives in order to secure entry to Hades.

Greek culture not only tolerated but expected extravagant manifestations of grief. Both men and women tore out their hair, rent their garments, beat and lacerated their breasts, and rolled on the ground in the dust. In part this behaviour was prompted by the belief that the deceased took pleasure in witnessing the exaggerated displays of grief that their death occasioned.

As soon as death occurred, the corpse would be prepared for the *prothesis*, or "laying out", which took place in the house where the deceased lived. First, the eyes and mouth were closed. Female relatives washed the corpse, anointed it with olive oil, clothed it, and then wrapped it in a winding sheet. Finally they laid it out on a couch with the head on a pillow and the feet facing the door. Visitors then came to view the body and dirges were sung in its presence. On the day of the funeral the bereaved accompanied the corpse to the burial site. If the family could afford it, it would be placed in a simple wooden coffin, though owing to the scarcity of wood it might only be covered with a few branches. The corpse was either borne by pall-bearers or transported in a cart.

Little is known about what took place at the burial service itself, other than the fact that ritualized laments were delivered. Though both inhumation and cremation were practised with varying degrees of popularity in antiquity, cremation was generally regarded as more prestigious, in part because this is how the bodies of Homeric heroes were disposed of. (The most detailed description of a cremation burial is that of Patroclus in Homer's *Iliad*, book 23.) After cremation the ashes were placed in an urn, which was then buried. Once the grave had been filled in, a grave marker was erected. The mourners then returned to the house of the deceased for a commemorative meal. Lastly, the house was ritually purified. Inscriptions from various parts of the Greek world indicate that it was customary to debar relatives from participating in the life of the community for several weeks.

The Greeks did not have cemeteries as such. Those who dwelt in rural areas buried their dead on their estates, whereas city dwellers buried them beside major roads. From around 500 BC the practice of burial within the city of Athens abruptly ceased, perhaps due to a law introduced by the politician Cleisthenes. The ban was no doubt connected primarily with the fear of pollution, but it may also have been due in part to the need to conserve as much residential space as possible. The busiest roads henceforth provided the most popular burial spots for wealthy families, as is indicated by the large number of tombs outside the Dipylon and Sacred Gates on the west side of the city in the neighbourhood known as the Ceramicus, or potters' quarter. In the final decades of the 5th century BC family plots became extremely popular among the wealthy. These were large rectangular spaces walled along the front and at the sides, access being gained from the rear. The popularity of this style of burial may be connected with the belief that members of the family could be reunited in the hereafter if they were buried together.

In Classical Athens concern for the well-being of the dead did not cease after burial. On the contrary, relatives continued to maintain a close attachment to the deceased long after death had occurred, since their welfare in Hades was believed to be dependent upon the attention they received from the living. The anniversary of the day of death was especially important. The dead were believed either to dwell close to the grave or at least to be capable of visiting it when summoned. For this reason a variety of gifts were deposited on the steps of the tomb, including jars of olive oil, myrtle branches, wreaths, cakes, and wine. In addition, the gravestone was anointed with olive oil and coloured sashes were wound around it. In Classical Athens the care of the dead was considered to be so important that it constituted a reason for adopting an heir.

Festivals in honour of the dead were major features of the sacred calendar. One such was the second day of the Anthesteria festival, which was equivalent to All Souls' Day, since the dead were thought to leave Hades and wander abroad. Most spectacular of all was the annual ceremony in honour of the war dead, which took place in early winter at the end of the campaigning season. An account of the ceremony conducted on behalf of those who died in the first year of the Peloponnesian War was provided by Thucydides (2. 34ff.), who also included the speech delivered by Pericles on that occasion. Only the most courageous war dead were accorded the privilege of being interred on the field of battle. They included the 192 Athenians who fell at the battle of Marathon, around whom a cult was established. The most revered dead were heroes such as Theseus, Oedipus, and Orestes, who were believed to be capable of exerting considerable power within the vicinity of their graves. Their services could be invoked by

animal sacrifice. A clay pipe was sometimes inserted into the grave to enable the blood to reach the hero directly. Other important categories of the dead who received special rites include those who had been murdered, suicides, and those struck by lightning.

The Greeks felt particular sympathy for those who died at a marriageable age but who were unmarried. To underline their sad plight, a stone marker in the form of a *loutrophoros*, the vase used for the nuptial bath, was placed over the grave. Generally, however, Greek funerary art is remarkably reserved in its depiction of death and all sentimentality is eschewed. Sculpture depicts the deceased in a domestic setting in the company of family members. A particularly common image is that of two people, either standing or seated, shaking hands. In such cases it is usually impossible to discern which is the deceased and which the living, and we are left wondering whether the handshake is one of farewell between the living and the dead or one of greeting between the newly arrived in the underworld and those less recently arrived.

By definition death separates the world of mortals from that of the gods. Though the Olympian deities occasionally mourn the passing of a favourite, for the most part they are indifferent to human loss. Their removal from the physiology of death was due to the fact that proximity to the dying and the dead exposed them to risk of pollution caused by death. As Artemis observes in Euripides' *Hippolytus* (1437f.), it is not permitted by divine law for a deity "either to look at the dead or to sully their eyes with the expirations of the dying". For the same reason no priest or priestess was allowed to enter the house of the dead or attend a burial.

There are a number of parallels between modern and ancient Greece in regard to the treatment of death. Modern Greeks, like the ancients, tend to accept the physiological aspect of death as a natural fact of life. They are also much more likely to die in the comfort of their own beds than is the case in either Britain or the USA. When death is imminent the Orthodox priest performs the sacrament known as the Anointing of the Sick, or Unction. The belief still persists that the soul leaves the body through the mouth. Women continue to play the leading role in the care of the dead. A young woman who dies unmarried is sometimes buried wearing the bridal dress and crown that she was unable to wear in life. Fondling and kissing the corpse frequently occur, as they did at an ancient *prothesis*. Laments are sung by women both in the house of the deceased and at the graveside. Coins are placed in the coffin before it is lowered into the grave. On returning from the burial, those who have come into contact with the deceased are required to wash in order to purify themselves. *Kedeia*, the ancient Greek word for "funeral", which literally means "caring for", is still in regular use. The soul of the deceased is believed to linger on earth for 40 days before ascending to heaven.

The Greek Orthodox Church permits only inhumation, not cremation. The wealthy favour costly marble monuments to the dead. In addition, a glass case containing an oil lamp and a photograph of the deceased may be placed at the head. Periodic visits to the cemetery take place up to three years after burial. Close relatives of the dead remain in mourning throughout that period, observing dietary restrictions and wearing black, though a widow may wear black for the rest of her life, especially in rural areas. Partly for economic reasons, after three years have elapsed it is customary to exhume the dead and transfer the remains to the community ossuary, though the wealthy may elect to leave the dead in a family plot. By this time the flesh has usually disintegrated. Its failure to do so is sometimes interpreted as a sign that the deceased was evil. So ingrained is this belief that an extension is often granted in the case of those who underwent medical procedures, such as chemotherapy, that may delay the rate of decay.

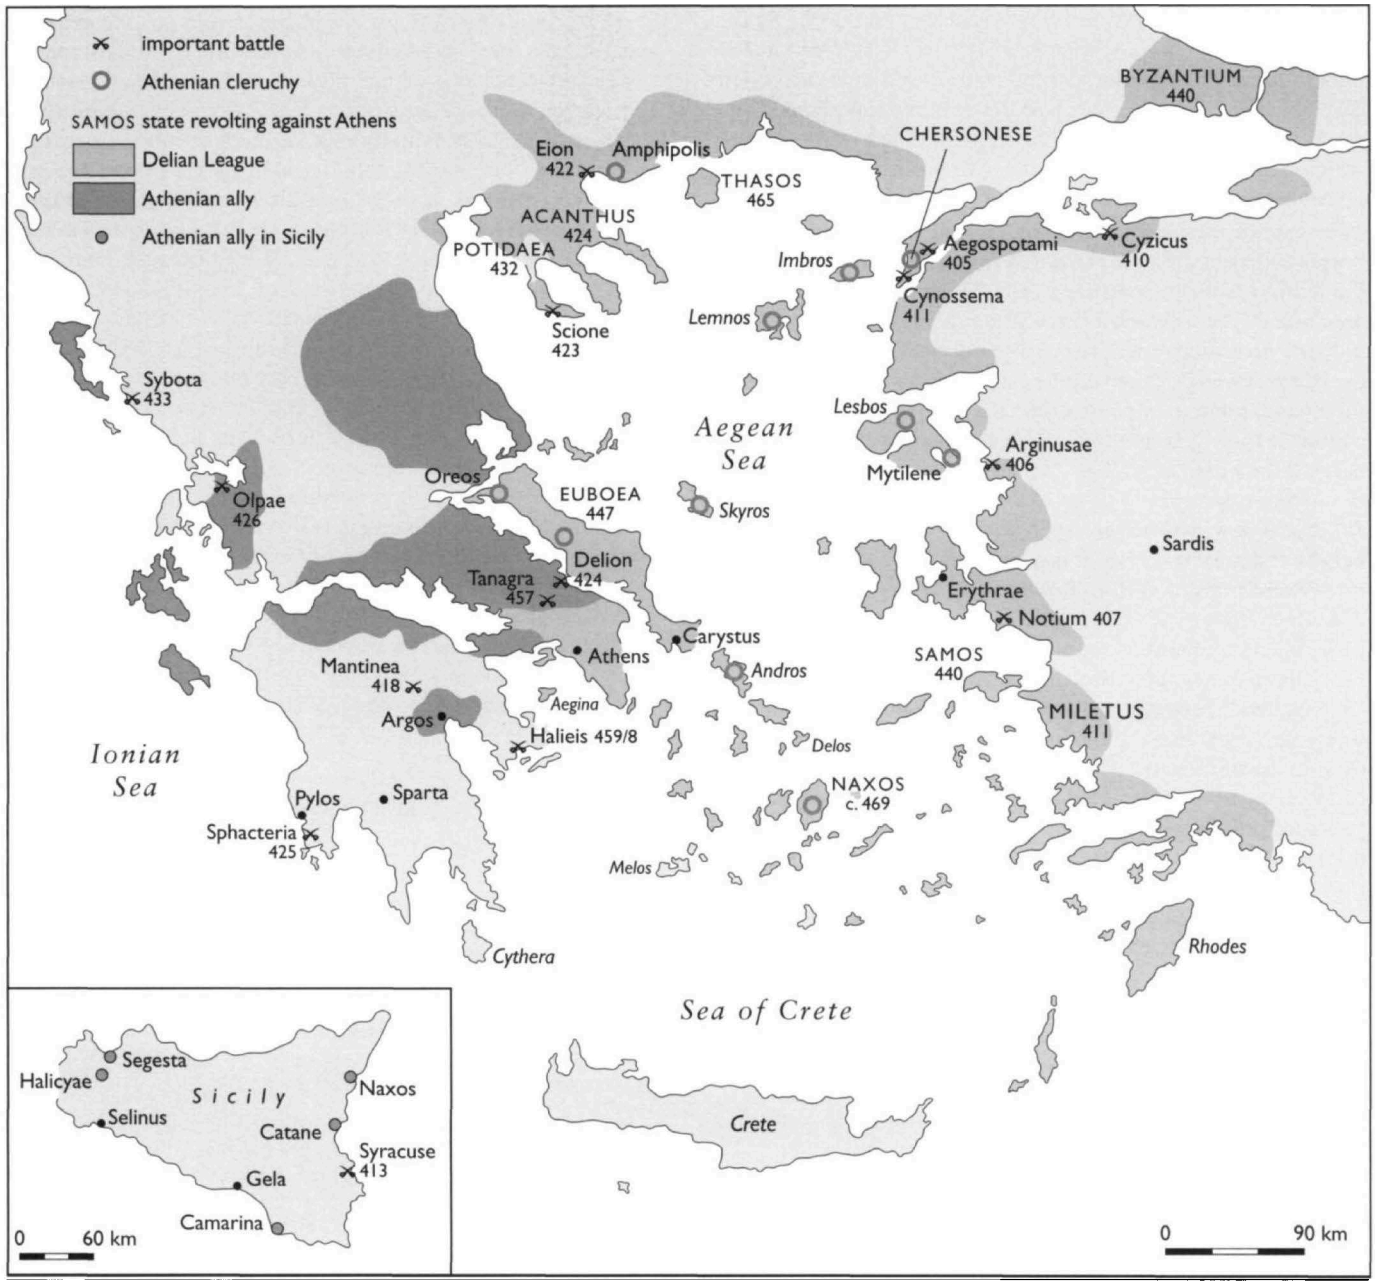
Delian League

Major source of Athenian power in the 5th century BC

The Delian League, a modern name for what was originally called "the Athenians and their allies", was established in the winter of 478/77 BC and lasted until the defeat of Athens by Sparta in 404 BC. It arose from discontent with Spartan leadership of the Greek war effort against Persia in the aftermath of the great victories in 480–479 and, particularly, with the conduct of the regent Pausanias in 478. According to Thucydides, the non-Peloponnesian allies, and especially the Ionians and those recently freed from Persian rule, approached the Athenians to lead them and they decided to take advantage of the situation (1. 95. 1–2).

The Athenians quickly settled on the contributions to be paid by members of the new alliance, either ships fully equipped for a campaigning season or money in lieu of personal service (*phoros*, usually translated as "tribute"), and arranged for a council (*synodos*), at which each member had one vote, to meet at Delos, where the treasury was established. Alliances at this time usually had a specific duration, but here the allies threw lumps of iron into the sea to bind everyone, including the Athenians, for ever.



17. The Delian League and allies of Athens, 460–446 BC

Several aspects of the alliance remain controversial, including its purpose, its extent, and the size of its revenues. Regarding its purpose, Thucydides says that the "pretext" (*proschema*) was to punish Persia for damage done (and to liberate any Greeks still enslaved: 1. 96. 1; cf. 3. 10. 3; 6. 76. 3); so this was not really a *symmachia*, an alliance whose members swore unconditionally to have the same friends and enemies (the word "pretext" may refer to later Athenian practice, when the league had become an Athenian empire and its resources were used for general Athenian purposes). As for its extent, there is no specific information about its membership at the beginning, though it seems likely that most non-Dorian islands of the Aegean plus coastal cities in northern Greece/Thrace, the Hellespontine area, Aeolia, and Ionia quickly joined; ultimately, there were over 200 members (cf. the Athenian tribute lists for 447–446 BC). With regard to finance, Thucydides states that the "*original* tribute" was 460 talents (1. 96. 2), which implies subsequent adjustment; and indeed, in speaking of Athens' finances at the outbreak of the Peloponnesian War in 431 BC, he says that 600 talents of *phoros* came from the allies each year on average, exclusive of other revenue; there was also a reserve of 6000 talents, which had once been as large as 9700 talents. However, the detailed records of league monies entrusted to Athena for safekeeping after the transfer of the treasury from Delos to Athens (probably in late 454 BC) suggest that the revenues deposited in Athens rarely, if ever, exceeded 400 talents per annum in the period 454–426 BC. Various attempts to explain this seeming contradiction include failure to pay/late payment by the allies, reduction of the tribute after *c.*467, and error on Thucydides'

part: none of these suggestions is satisfactory and probably the best that can be done with this problem is Unz's suggestion (1985) that the amounts deposited in Athens represent surpluses from fleet operations, costs of maintaining bases and garrisons, and possibly shipbuilding in allied yards, all of which items were paid for on the spot from local or district revenues.

It cannot be denied that the league fulfilled its initial purpose: Persian bases in the north Aegean area were captured, the Dorian cities of southwest Asia Minor were liberated, an apparent Persian invasion force was intercepted and smashed in battle near the mouth of the river Eurymedon in Pamphylia, expeditions were sent to Cyprus on at least two occasions, and there was a major attempt to detach Egypt from the Persian empire (459–454 BC), all of which resulted in either a formal peace ("the Peace of Callias") or an agreed informal cessation of hostilities in *c.*450–449 BC. At the same time, however, the Athenians saw and seized upon opportunities for their own benefit and power: certain states were forced to join the league, many were prevented from leaving, and those that fell foul of Athenian rigour in insisting on punctilious fulfilment of membership obligations found themselves reduced to the level of "subjects" through the imposition of separate, bilateral "agreements" between themselves and Athens. The results of this were often humiliating – surrender of warships, dismantling of fortifications, obligations to submit certain types of court case to Athens for final judgement, acceptance of garrisons and overseers, imposition of "democratic" constitutions, provision of troops over and above the payment of *phoros*, adherence to Athenian standards in weights and measures, enforced participation in Athenian religious festivals, and, finally, a requirement that all adult citizens swear various oaths proclaiming loyalty, goodwill, and even love towards Athens.

The conversion of an originally free and voluntary alliance into an Athenian *arche* (empire) was well under way by 450 BC, and after this empire had received formal acknowledgement in the Thirty Years' Peace (446/45 BC), the Athenians would refer to it as such, quite casually, and even argue that they had a perfect right to it. This attitude gave rise to increasingly severe punishments for rebellion, as in the case of Mytilene in 427 BC, outrages such as the destruction of Melos for refusing to accept Athenian control (416/15 BC), and the culminating *hubris* of the Sicilian expedition of 415–413 BC.

Throughout history, assessments of the significance of the Delian League have tended to be ambivalent. The radical democracy of the Periclean age owed much to the cash from the league, which made possible many of the benefits widely available to Athenians, while the stored-up surplus (see above) paid for the great building programme undertaken on the Acropolis after 450 BC. However, Pericles was criticized at the time for "decking out the city like some vain woman ... with thousand-talent temples" (Plutarch, *Pericles*, 12. 2; cf. the witty and sarcastic oligarchic pamphlet known as Pseudo-Xenophon, *Athenaion Politeia*), and although Athenian opinion in the 4th century regarded Periclean democracy as a class system whereby the "many" exploited and bullied the "few", there was, especially after the humiliating "King's Peace" of 387 BC, great pride in the power that Athens had wielded through the Delian League.

In modern times the period of the league has always been regarded as the "golden age" not only of Athens but of Classical Greece as a whole. However, even attitudes towards the league itself are still hotly debated: for example, in the 1950s and 1960s the question of whether or not the Athenian empire was "popular" among its subjects became an issue of Cold War rhetoric, with an English Marxist scholar arguing that it represented a liberation movement for oppressed masses in the various member states, while a US historian denied this with mutterings about "these days of 'People's Democracy'". Though this debate was conducted in somewhat simplistic terms, deeper consideration of the reality of the Delian League serves to remind us of two important truths: first, when Pericles describes the Athenian empire as a "tyranny" and when Cleon echoes this and describes its subjects as "disaffected conspirators", these are *politicians* attempting to persuade people to do something which they would not normally wish to do: politicians do not always tell the truth; second, given the polarization of Greece in the 5th century BC between Athens and Sparta, the average small state, although possessed of a typical Greek love of autonomy, was faced with a disagreeable choice: it is possible to *prefer* one of two options without particularly *liking* either of them (cf. the thoughts of Phrynichus described by Thucydides at 8. 48. 5–6).

CHARLES L. MURISON

See also Imperialism, Political History 490–318 BC

Summary

The Delian League is the modern name for the alliance that the Athenians established in 478/77 BC. Originally intended to punish Persia for damage done in the recent wars, it became the chief source of Athenian power in the 5th century BC. Its members numbered more than 200. The treasury was moved from Delos to Athens probably in 454 BC. By 450 the league had turned from a voluntary alliance into an Athenian empire. It lasted until the defeat of Athens by Sparta in 404 BC.

Deliyannis, Theodoros 1826–1905

Statesman and prime minister of Greece

Theodorus Deliyannis was the son of Panagos Papayannopoulos, scion of a family of notables from Langadia in the Peloponnese who had made their fortune during the last five decades of Ottoman rule in Greek lands and who had become leaders in the War of Independence. It was during these years that the family name was changed to Deliyannis.

After studying law at Athens University Theodoros Deliyannis entered the civil service and in 1859 became general secretary of the ministry of the interior. During these years as a civil servant he acquired an expertise in the running of government, which distinguished him from other contemporary Greek statesmen.

Deliyannis first became involved in politics as representative of Gortynia, his constituency, in the Second National Constitutional Assembly in 1862 which followed the overthrow of King Otho. His first ministerial post was that of foreign minister in the Roufos cabinet (1863) and the Kanaris cabinet (1864). Between 1867 and 1868 he served as Greek ambassador in Paris and brought about Greek participation in the 1867 international exposition there.

On his return to Greece he resumed his ministerial career at the foreign ministry and the finance ministry in the shortlived cabinets of Thrasyvoulos Zaimis that were so characteristic of the first years of King George's reign. His cabinet positions, and his cultivation of the patronage networks that were already in place through his family's long-standing influence, permitted him to strengthen his political leverage with his constituents. Supported by a small group of deputies, Deliyannis was therefore able to maintain a relatively independent attitude towards all the other party leaders.

His political importance was acknowledged in 1877 during the crisis which developed into the Russo-Turkish War. Deliyannis was invited to join the all-party cabinet under admiral Constantine Kanaris as minister for education. Alexandros Koumoundouros then chose Deliyannis as his foreign minister in his cabinet of January 1878 and appointed him Greek delegate to the Congress of Berlin to present Greek national claims. After 1880 Deliyannis openly opposed Koumoundouros, accusing him of a conciliatory attitude towards the Great Powers on the issue of the future annexation of new lands.

After Koumoundouros' death in March 1883, Deliyannis became leader of the parliamentary opposition and by the end of the year had given unity to its diverse forces. By targeting his rhetoric on attacks against the policies of Charilaos Trikoupis, and by promising the electorate to undo Trikoupis' reforms, Deliyannis won the elections of April 1885 and became prime minister.

In his first term Deliyannis accomplished very little as his party was divided on financial issues and was soon faced with an international crisis. The annexation of eastern Rumelia by Bulgaria in 1885 was once again destabilizing the Balkans. Impatience for the fortune of Greek claims to Macedonia created tensions within Greece. The government mobilized the army but the Great Powers, fearing a Greek attack on the Ottoman empire, blockaded Greek ports to force the government to demobilize. Deliyannis was compelled to resign in May 1886.

He returned to office in November 1890, having won election on an anti-Trikoupis programme. His financial policies, however, created tension with the country's foreign creditors and with king George, who dismissed his cabinet in March 1892 amid antiroyalist popular protests; but Deliyannis returned three years later after defeating Trikoupis at the 1895 elections, which marked the end of Trikoupis's career. In December 1893, however, Greece had defaulted and its creditors were pressing for a settlement of its international debt that would permit them to control public revenue earmarked to service the loans. Both Trikoupis and Deliyannis resisted these pressures as restrictions upon national sovereignty. Finally Greece was forced to yield after its defeat in the Graeco-Turkish War of 1897, a war which had been forced upon Deliyannis's weak government by public nationalist excitement. In April 1897 Deliyannis was once more forced to resign. Deliyannis became prime minister on two further occasions, in December 1902 and December 1904. He was assassinated in June 1905 by the owner of a gambling club as a result of the legislation against gambling that he had put into effect.

Deliyannis's policies favoured financial retrenchment and distribution of patronage through government appointments. He also paid special attention to educational reform and to the economic hardships of the landless tenant farmers of Thessaly. Unlike his opponent Trikoupis, Deliyannis was conservative in his estimates of Greece's capability for rapid economic development. He was furthermore unwilling to encourage Greek and European bankers in search for capital to stimulate material development. He expressed his political views through *Proia*, his party newspaper. His party was kept together in opposition by patriotic, populist, and, at times, anti-western rhetoric but when in power proved incapable of implementing a consistent policy. His inability to withstand pressures from within his own party and from public opinion seriously impaired his international standing. These shortcomings contributed to the demise of the Greek two-party system, which had emerged in the 1880s and 1890s.

Biography

Born in 1826 to a Peloponnesian family, Deliyannis studied law at the University of Athens. He first entered parliament as deputy for Gortynia in 1862–64. In 1867–68 he was ambassador to Paris and in 1878 he led the Greek delegation to the Congress of Berlin. He was prime minister of Greece in 1885–87, 1890–92, 1895–97, 1902–03, and 1904–05. He was assassinated in 1905.

Delos

Aegean island

Delos is a small island, surrounded by a circle of larger islands known collectively as the Cyclades. It is largely waterless and with little agricultural land. Its importance in antiquity therefore derived primarily from its religious significance, as one of the principal and international sanctuaries of Apollo. Greek mythology related that when Leto, pregnant by Zeus, was about to give birth, no place would receive her in case it incurred the wrath of Hera. Delos, which was then an unfixed, floating island, was the exception, and sheltered Leto, who gave birth there to Artemis and Apollo. In gratitude, Apollo fixed the island in its present location. Like most myths, this is a preposterous story, but there is no clear material reason why the island should have assumed its sacred character.

Evidence for activity on Delos dates at least as far back as the Late Bronze Age. Mycenaean remains, traces of walls and deposits of objects including figurines have been found in the area of the later Classical sanctuary. A revival or redevelopment of the island came with the general reawakening of the Greek world in the 8th century BC, and as a result of interest from the surrounding Cyclades. Particularly significant was the island of Naxos. By the end of the 7th century the Naxians had built a simple rectangular structure, its ridge supported eventually by a single row of thin marble columns, and later referred to as their Oikos, or house; it is very likely that this was in fact the first temple dedicated to Apollo. The marble for the columns was quarried on Naxos and shipped to Delos. Also of Naxian marble, and very spectacular, was a colossal statue of Apollo erected around 600 BC at the side of the Oikos. Only fragments survive, but they give an indication of the statue's original size. It stood on a single enormous block of marble, *c.*5 × 3 × 0.82 m, estimated to weigh about 32 tonnes; the statue itself was about four times life size, and therefore larger than the colossal statue in the sanctuary of Hera at Samos (much better preserved), which is about three times natural size. The Apollo statue copies the pose of the colossal statues of Egypt but, unlike them and like the Samian statue, was probably nude.

Towards the end of the 6th century Naxian influence waned, and eventually Delos came to be dominated by Athens, a domination that was to endure, with intervals of independence, for much of the island's history. During this first period a limestone temple was dedicated to Apollo; the building technique is similar to that of Athenian buildings. Delos was treated with respect by the Persians, with the intention of securing the sympathy of the Greek states, but after the defeat of Xerxes in 479 BC Delos became instead, under the protection of Apollo, the centre of the Delian League dominated by Athens with the purpose of keeping the Persians out of the Aegean and liberating the east Greek cities. Twenty years later, with the renewal of the Persian threat, the treasury and control of the league were transferred to Athens. The festival of Apollo continued and was of great significance still to the Athenians, who would dispatch each year one of the state triremes, the oared warships which had won the battle of Salamis. In 426 BC the Athenians went even further. Concerned that the plague which had decimated the population of Athens indicated that they had incurred the wrath of Apollo, the god of healing, the Athenians "purified" the island. Because of its sacred character laws prohibited birth and death on the island: pregnant women, and all those about to die, had to leave for the neighbouring island of Rheneia. Despite this there were many graves there (many perhaps dating to the prehistoric period). These were cleared and the contents shipped to Rheneia. The Athenians also built a new, marble temple to Apollo, in the Doric order: uniquely, it shows in its design the influence of the Parthenon.

By this time the island certainly had its own resident population, though as yet there is little archaeological evidence of the settlement they inhabited. With the defeat of Athens in the Peloponnesian War they attempted to reassert their independence, only to have the Athenians return in 394 BC. It was not until 80 years later, in the very changed world that followed the Macedonian conquest and the confusion that resulted from the break-up of Alexander's empire, that Delos became independent. All the same, it was used by the various successors of Alexander, particularly Ptolemy I and then Antigonus Gonatas, as the centre for their own island leagues by which they hoped to control the Aegean. This domination also meant patronage. The kings founded festivals (in their own honour, as much as Apollo's); they also had buildings constructed in and around the sanctuary, particularly porticoes (stoas). Most intriguing is a long narrow building east of the temples, the so-called Monument of the Bulls, because of the bulls' heads that rise above two internal half-columns. It was probably the Neorion, a ship shed in which one of the Hellenistic kings – almost certainly an Antigonid since these kings used the bulls' head motif elsewhere as in the Stoa of Antigonus – dedicated a ship in consequence of a naval victory; either Demetrius Poliorcetes, after the crucial battle of Cypriot Salamis in 306 BC, or his son Antigonus Gonatas, after the battle of Cos in the mid-3rd century BC.

In many ways the heyday of the island was in the 2nd century BC, particularly the years after the final Roman defeat and dismemberment of the Macedonian kingdom. The Romans restored the island to Athenian control, but this was a much weakened Athens, and the reality was Roman domination under a suitable disguise. Delos was declared a free port, and as such seriously interfered with Rhodian trade when that island, an erstwhile loyal supporter of Rome, displeased the Romans through half-hearted support in the war against Macedon. The island received an influx of Roman and Italian settlers, along with traders from other places, such as Berytus (modern Beirut). Under the settlers and the Greek inhabitants the area of the town increased considerably, with many luxurious houses, typically with splendid (though later robbed)

Delos: view of the sanctuary of Apollo, focus of political institutions as well as religious activity on the island

mosaic floors, marble columns round courtyards (beneath which were deep storage cisterns to alleviate the perennial water shortage), and walls built of local stone which were plastered and decorated with elaborate painted designs. Trade was vigorous; Delos, despite its religious significance, was an important place for the sale of slaves, many derived from the hinterland of Anatolia.

In the disintegrating political conditions of the 1st century BC, after the kingdom of Pergamum was bequeathed by its last king to the Romans, piratical raids from the harbours of southern Anatolia grew in intensity. Delos, a small island with no defensive system, was particularly vulnerable. In 88 BC it was seized by the troops of Mithridates king of Pontus in his war against the Romans, and pillaged. The destruction was completed by his allies, the pirates of Athenodorus, in 69 BC. Even the special centre sections of the mosaic floors were removed, and the town abandoned.

Thereafter, though the island continued to function religiously, activity was on a small scale. There are indications of a Christian population in the 3rd century AD, but the island was finally sacked in the 8th century AD, and then awaited its rediscovery by western scholars, beginning with Cyriac of Ancona who visited the island in 1445.

Summary

An island in the Cyclades, Delos is traditionally the birthplace of Apollo and Artemis. After the Persian Wars Delos became the centre of the Delian League, which was dominated by Athens and designed to protect Greece from further Persian aggression. Independent from 314 BC, the island prospered especially in the 2nd century BC as a free port and centre of trade. Sacked in 88 BC by soldiers of Mithridates and in 69 BC by pirates, it never regained its prosperity.

Delphi

Ancient sanctuary of Apollo in central Greece

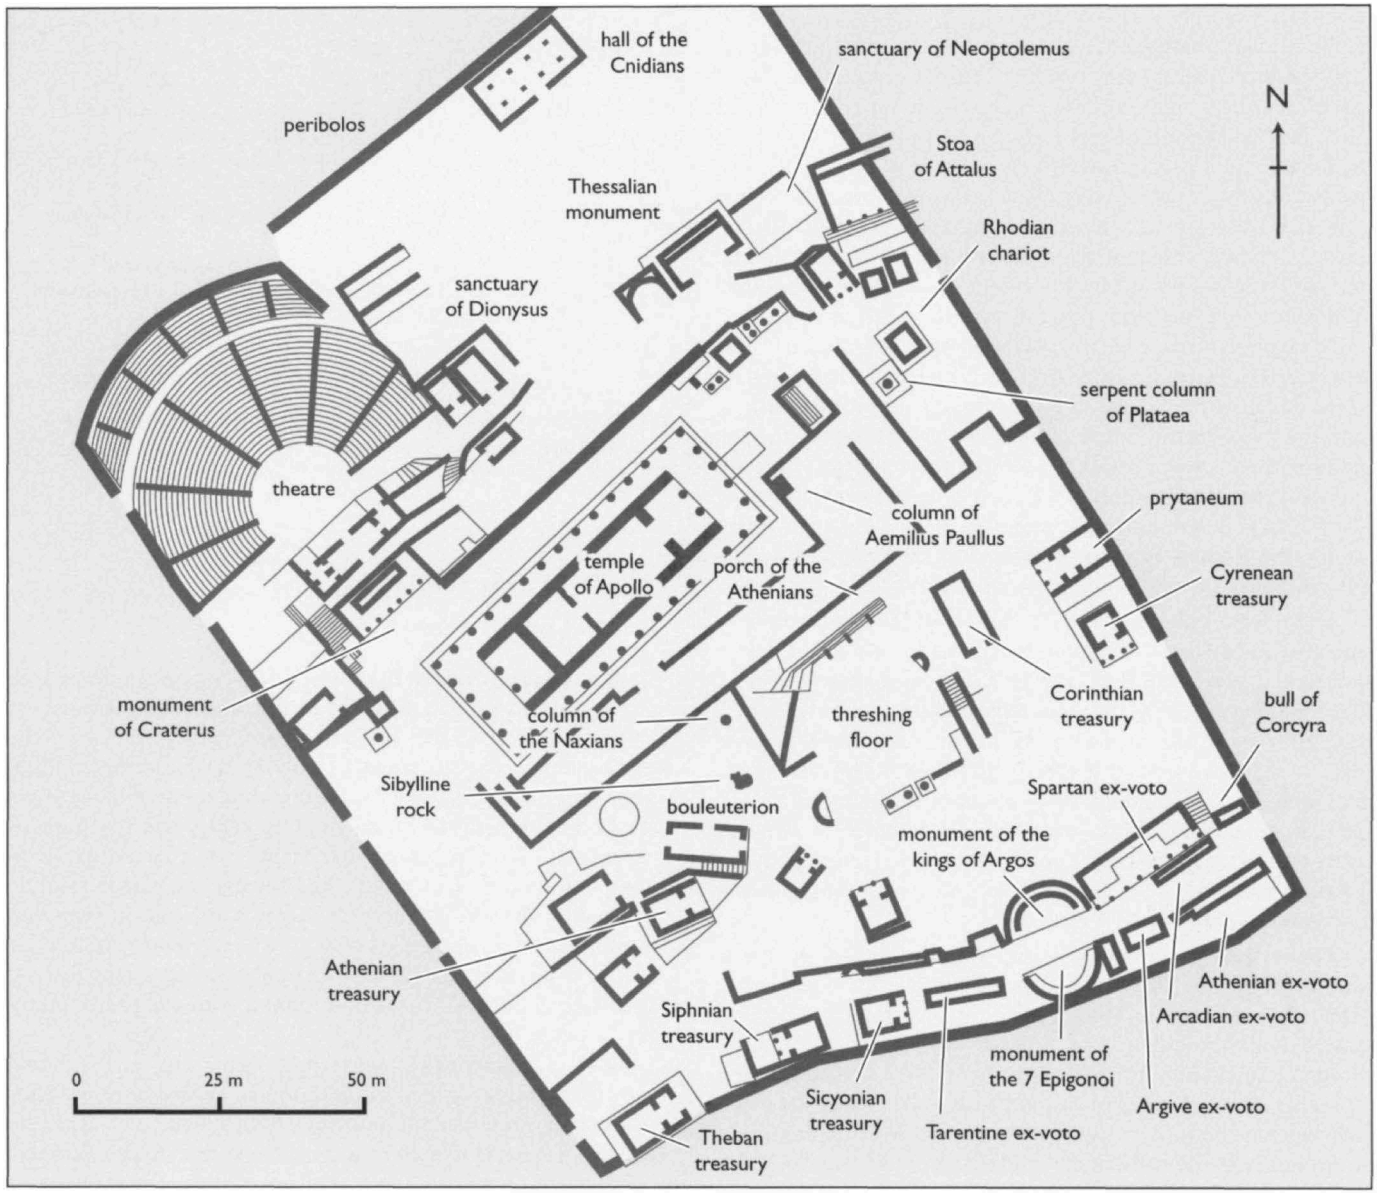
Delphi was the principal sanctuary of Apollo on the Greek mainland, situated on a shelf of land on the southern slopes of Mount Parnassus, and looking out to the sea at Itea and the gulf of Corinth. It was therefore accessible from the Peloponnese by sea across the gulf. Land routes linked it with the isthmus of Corinth and Athens by way of Thebes in

Delphi: tholos of the sanctuary of Athena Pronaia, built *c.*390 BC

Boeotia, while another route passed directly to the north, to the back of the mountains above Thermopylae and down to the plain of Lamia. Geographically it belonged to the district of Phocis (whose most important city, Amphissa, was only a short distance away), but such was its religious importance that it was controlled rather by a special international body, the Amphictyonic Council, the council of "those who dwell around", i.e. the surrounding communities which had a special interest in the religious significance of the place. In addition to the sanctuary there was a small adjacent town, but this was little more than ancillary to the religious function.

The reason for its religious significance (outside the mythology attached to it) is nowhere stated, but it was probably a combination of its generally awesome character, with the towering cliffs of the mountain immediately above, and the abundant supplies of water from its springs, including what was probably the most renowned spring in Greece, Castalia. Delphi originated in prehistoric times, and there are traces of walls and the usual deposits of figurines from the Late Bronze Age. According to myth, Apollo took over the sanctuary from its previous owner, Gaia. This may represent a change of presiding deity during the period that followed the political and cultural collapse of the Late Bronze Age communities, but everything seems to have been on a small scale, and there are no significant remains until the 6th century BC.

From the religious point of view, Delphi was most famous for its oracle. Pilgrims to the sanctuary could present their enquiries to the Pythia, the priestess, who mounted the sacred tripod in order to respond: the belief that she would go into a trance and rave is now discredited. Most famously, the enquiries were for predictions of the future, many of which are recorded by Herodotus, most notoriously the reply given to the non-Greek king of Lydia, Croesus (who was a great supporter of the sanctuary, showering it with expensive dedications, having been impressed by its efficacy). His last consultation was to enquire what would happen if he engaged in war with Cyrus, king of Persia. The oracle replied that a great empire would be destroyed, but omitted to say which. Croesus thought it meant the Persian empire, so went to war: in the event, it was his own empire that was destroyed. Most of these apparent oracular responses were probably inventions, and actually postdate the events they were meant to predict. They



18. The sanctuary at Delphi

tended to obscure the true nature of the questions and responses, which was to seek guidance concerning the proper course of action to be followed in given circumstances. These could be for an interpretation of religious behaviour—what was right and proper – where the oracle was believed to have specialist knowledge and status far removed from mere fortune telling. The oracle, and its representatives, must have acquired a fair general knowledge of the world in which the Greeks lived, practical as well as religious. Advice was given on whether to send out a colony, or where, and what procedures would be desirable. The oracle was not above being influenced by others. In the last quarter of the 6th century BC a splendid new temple was built to Apollo, surrounded by a complete peristyle of Doric columns. It was to be built, as was most Delphian architecture, in the local limestone. The Athenian politician Cleisthenes undertook the contract (which meant he was financially liable if the work did not come up to the required standard), but for the east front and its pediment sculpture he provided at his own expense costly imported white marble from Paros. This was not altruistic; in return, the oracle responded to consultations by the Spartans by putting pressure on them to intervene and secure the return of Cleisthenes from exile to Athens. It worked.

The sanctuary consisted of a series of terraces, rising one above the other and linked by a "sacred way", a processional route which zigzags from the lowest terrace to the front of the temple at the middle level. Cleisthenes' temple was destroyed by a fall of rock in the 4th century BC, but was rebuilt to the same plan and design, the funds this time being collected by contributions solicited from the whole of Greece. Lining the sacred way were dedications to Apollo given by cities which had cause to be grateful to him. These included statues, or groups of statues set on bases of various forms and elaboration, up to complete buildings, the so-called treasuries (a misleading translation of the Greek term *thesauros*) some of which were elaborately decorated miniature temples. The most

elaborate example was that given by the Cycladic island of Siphnos in gratitude for the discovery of a rich vein of silver on the island. Female figures (usually called Caryatids) replaced the more usual columns of the porch, which in this case would have been in the Ionic local to Siphnos, not the Doric of the mainland. Lavish sculpture also decorated the frieze and pediments. Nearby is the treasury of the Athenians, which perhaps celebrated Cleisthenes' return and the restoration of democracy at Athens, though many scholars believe it was a thankoffering for the victory at Marathon some 20 years later. Another famous offering was the tripod, a bronze cauldron supported on a column formed by intertwined snakes of bronze. This celebrated the Greek victory over the Persians at Plataea. The commander of the Greek allies, the Spartan regent Pausanias, boastfully put his own name on it. This caused offence, and the name was removed; instead the column was engraved with the names of the Greek states which had fought together against the Persians. It was eventually removed in the early 4th century AD by the Roman emperor Constantine, who took it to his New Rome, Constantinople, where part of it still survives.

There were many more memorials, and the sanctuary was enlarged in stages to accommodate them all. Round it was a substantial perimeter wall, the *peribolos*, also extended and improved over the ages, but which eventually, in the Hellenistic age, burst its seams with some buildings, such as the Stoa of Attalus, being constructed over it. In addition, several buildings were built below the main sanctuary including a second, smaller sanctuary, with a succession of temples of Athena, more treasuries and the circular Tholos, a Doric building of the 370s BC, the purpose of which, and, indeed, proper name, is uncertain. Nearby stood a gymnasium.

The sanctuary continued to flourish in the Hellenistic age. It was consulted by the Athenians early in the 1st century BC, when they wanted to restore religious practices which had ceased with the passage of time. It was supported by the Romans, and continued to be consulted and respected into the 2nd century AD. In the confusion of the 3rd century AD it fell into decline and evident disrepair. Attempts were made to tidy it up, but with the conversion of the empire to Christianity its purpose was lost. The emperor Julian tried to revive it as part of his restoration of paganism in the 360s, but the authorities had to make the sad reply "Tell the emperor that my hall has fallen to the ground. Phoebus no longer has his house, nor his mantic bay nor his prophetic spring: the water has dried up."

Parts of the sanctuary and some buildings were converted to Christian use, but Delphi never regained the same importance. By the 19th century, the site was covered by a squalid village, which was rebuilt on an adjacent site so that the French School at Athens could begin excavations.

Summary

Delphi is the site of a major sanctuary of Apollo, best known for its oracle. As a shrine of supranational significance, its political independence was vital. It was therefore administered by a confederacy known as the Amphictyonic Council. There are no significant remains from before the 6th century BC. The oracle continued to be consulted into the 2nd century AD and was finally closed by Theodosius I in AD 390.

Demetrius, St d. *c.*300

Patron saint of Thessalonica

Demetrius is one of the Byzantine military saints, and as such is often depicted as a warrior, in full armour, sometimes on horseback, often in the company of St George, from whom he can sometimes be distinguished only by his hairstyle (less full, and seldom covering his ears). Like several other military saints (Procopius, for instance), his military career is a posthumous invention. So too, most likely, is his association with Thessalonica, of which city he had became the patron saint by the end of the 6th century. His earliest association was with Sirmium, and it is here that he was probably martyred and his cult first established. The cult of St Demetrius seems to have been transferred to Thessalonica along with the prefecture of Illyria in the mid-5th century.

In the accounts of his martyrdom Demetrius' fate is bound up with a young man called Nestor. The oldest account seems to be that preserved by Photios (*Bibliotheca*, cod. 255), in which Demetrius is martyred by the emperor Maximian as a result of the emperor's anger after the death in the arena of his favourite gladiator Lyaeus at the hands of Nestor. Other accounts make a closer link between Demetrius and Nestor: Demetrius becomes a teacher of Christianity, with Nestor as one of his pupils, who dies calling upon the "God of Demetrius". Still later accounts make Demetrius a noble senator and military commander, in this reflecting Demetrius' posthumous military career.

We know more about the cult of Demetrius than about his earthly life. Already by the end of the 6th century a series of miracles were attributed to him, in which he shows his care for the people of Thessalonica. This earliest collection of miracles was put together by John, archbishop of Thessalonica, shortly after 610. From this it is clear that there was no tradition in Thessalonica as to the whereabouts of his relics: the cult was focused on the icon of the saint (which does not survive) in a shrine, surmounted by a ciborium, in the church dedicated to him. It is only in the last 3 (out of 15) of these miracles, which concern the siege of Thessalonica by the Slavs in 586, that Demetrius appears in a military capacity, leading the resistance to the siege. A second, anonymous collection of miracles

St Demetrius: icon in enamel, 12th century, Museum of Islamic Art, Berlin

concerns Demetrius' care for the city of Thessalonica during the episcopate of John (*c.*605–20), especially during the Slav attack on the city of 614, and in the defence of the city against siege by the khagan of the Avars at harvest-time in 618, during which John rallied his fellow citizens on the city walls, after a premonitory dream in which St Demetrius appeared, assuring him of the city's safety. Demetrius' care for the city continued and there are several later accounts of his miracles. Perhaps, in part, because of the role played by the saints of Thessalonica, Constantine/Cyril and Methodios, in the beginnings of Slav Christianity, the cult of St Demetrius became widespread among the Slavs.

Thessalonica itself became a centre for pilgrimage because of the cult of St Demetrius. The first basilica of St Demetrius, in the central part of the city, was built in the last quarter of the 5th century. This church was damaged by fire in the early 7th century and immediately restored; it was again virtually destroyed by fire in 1917 and rebuilt, so far as was possible, from the original materials. The focus of the cult was the icon, from which issued, from time to time, healing oil, hence the saint's epithet, *myrovlytos*, "oil-gushing". The church itself was decorated with mosaics and frescos: some of the surviving mosaics date from the late 6th and late 7th centuries, and, since they depict the patrons who commissioned them, give valuable evidence for the changing balance between secular and ecclesiastical power in the 7th century. *Encolpia* (pendents), depicting the saint lying in his tomb, were made as souvenirs for pilgrims.

Demetrius has remained a popular saint, in both the Greek and the Slav worlds, as is evidenced by the popularity of the name (in its Slav form, Dmitri).

ANDREW LOUTH

Biography

Little is known of the life of Demetrius except that he was a teacher in Sirmium who was executed by the emperor Maximian (286–305). His cult seems to have moved to Thessalonica in the 5th century where as a soldier saint he was credited with many miracles, notably in defence of the city. His icon (now lost) became a focus of pilgrimage.

Democracy

When the Athenians finally settled on "democracy" to describe their characteristic form of government, the term won out over several competitors: *iso-kratia* (equality of power), the Ionic word *is-egorie* (equality of expression), perhaps also *iso-moiria* (equality of sharing). Originally, "demos" meant the whole people, including aristocrats, but by the 5th century BC it came to imply, if not actually connote, the common people, the plebs. *Demo-kratia* means "power (*kratos*) exercised by the whole people (*demos*)", and it was used in explicit contrast to other more restricted forms of government such as *aristo-kratia* (power held by "the best") and *olig-archia* ("rule by a few").

Democracy had roots and antecedents. Already in Homer's day (perhaps 725 BC) rulers had lost, or were losing, whatever autocratic power they may have once possessed. The Greek high command at Troy felt it prudent, if not necessary, sometimes to summon assemblies to hear proposals and – ideally – ratify them without significant opposition. In *Iliad* 18 Achilles' shield is described as depicting some kind of popular gathering engaged in judging conflicting legal claims. At the end of the *Odyssey* the Ithacans assembled to debate alternative courses of action in response to Odysseus' slaying of the suitors. "Dark-Age kingship", a shadowy and poorly documented period, gave way in most Greek cities to oligarchic rule by a fairly wide circle of aristocratic families. Best attested is the

government of the Bacchiadae at Corinth, and in many states, e.g. Thebes, this was the form that prevailed, with variations, through the historical period.

Sparta was an exception to this pattern. Here, in the mid-7th century, there occurred an experiment in a kind of proto-democracy. A document known as the "Great Rhetra" records a brief interval around 650 BC when the assembly of all Spartan citizens had the right to "speak in opposition" and make modifications to legislation introduced by their two kings and council of elders. The privilege lasted a generation at most, after which the legislative process reverted to the system familiar from other oligarchies in which the popular assembly served as little more than a rubber stamp of proposals put to it by the ruling council. Also of interest is an inscription from the island of Chios dated 575–550 BC that details a judicial procedure involving "(legislative) enactments of the *demos* [people]" and a "council of the *demos*" to hear judicial appeals.

First moves were made towards democracy at Athens when Draco produced a law code about 621 BC. Although it was remembered as having been extremely harsh, the very fact that it was written down was a step towards justice for the ordinary citizen, who now had some recourse against arbitrary decisions by the aristocrats. A reasonable claimant to the title "Father of Athenian Democracy" was Solon, a far-sighted and imaginative individual who revamped the Athenian law code in 594 BC. Athens was on the brink of class warfare brought about in part by an antiquated system of land tenure that allowed wealthy landowners to take over smallholdings and reduce their former owners to the status of indentured serfs. One of the slogans attributed to Solon was "equality breeds no war", but what he brought about was equality not of possessions – he resisted demands made by the poor to redistribute the land – but rather equality before the law. He is reported to have said, when asked what he considered the best city to live in, "the one in which those people who are not wronged, no less than those who are, come forward and punish the wrongdoer". From now on anyone who wished could seek legal redress on behalf of one perceived to have been a victim of injustice, and magistrates' decisions could be appealed to a jury court. According to Aristotle, "Solon appears to have set up the democracy by constituting the jury courts from all the citizens" (*Politics*, 1274a1ff.).

The period after Solon was marked by civil unrest and a spell of "tyranny" by Pisistratus and his sons. Luckily for the Athenians, their lawcode was left intact; the Pisistratids merely manipulated it in such a way that their own supporters were usually in positions of authority. After the tyrants were driven out in 510 BC there was a danger that matters would collapse into a melee of aristocratic infighting, but one of the contenders, Cleisthenes the Alcmeonid, swung the balance in his favour by promising the *demos* reforms. Cleisthenes effectively cut through and dismantled local fiefdoms based on the aristocrats' control of religious and political activity within their own regions. Cleisthenes regrouped the citizen body along national lines. Voting on important matters and serving in the army were henceforth to occur within a complex and artificial system of ten newly created tribes, whose distinctive feature was that they were composed of members from widely disparate districts of Attica. Moreover, Cleisthenes either created a legislative council for the first time or drastically refashioned an earlier and more primitive *Boule* (council) instituted by Solon. As will be seen, the Boule was the pivot around which the whole democratic legislative apparatus functioned.

A further important step towards democracy was made by the reform of the Areopagus, Athens' senior council, by Pericles and Ephialtes in 462 BC. Most of the judicial functions of this venerable body were distributed among the Council of 500, the Assembly of the people, and the lawcourts. Probably at this same time Pericles also introduced a bill that provided a daily allowance to members of the juries. This made it possible for poorer citizens to put their names forward to serve on the juries, and gave substance to the claim that an Athenian brought before a court of law was given a trial before a "jury of his peers". It was a characteristic of the full-blown democracy that payment was subsequently instituted for other kinds of public service: discharge of duties as a councillor, infantry duty, rowing in the fleet, and, finally, attendance at meetings of the Assembly and, for citizens who could demonstrate financial need, admittance to the major dramatic festivals.

What made Athenian "democracy" truly democratic in practice was the ubiquity of the lot as an instrument of selection. Certain officials were elected: the ten generals, one from each of the (Cleisthenic) tribes, and other officers whose functions were rather specialized, like treasurers. Otherwise, allotment to office was the rule, from the annual archons down. This system of allotment was all-pervasive. There are references to boards of "contractors", "market supervisors", "weight-and-measure superintendants", "inspectors of dockyards", and so on, so that the figure of 700 for such annually rotating officers, preserved in the *Constitution of Athens* but sometimes doubted, seems entirely believable.

If sovereign power rested with the *demos* collectively assembled, which had responsibility for war and peace, taxation, foreign affairs, and other important matters touching on the welfare of the body politic, what assured relatively smooth functioning of the whole apparatus was the Boule or Council of 500, ten tribal contingents of 50 chosen annually by lot and known as *prytaneis* (with the tenth part of the year in which they served known as a "prytany"), who took it in turn in a sequence decided by lot at the end of the preceding prytany to prepare the agenda for the Assembly. The 50 *prytaneis* met daily and actually lived together for their 35 or 36 days in a special building, the Tholos. Effectively, the day-to-day running of the Athenian state fell to them. They had the further duty of selecting, also by lot, one of their number to preside at their own meetings and at the meetings of the Assembly, which were held normally four times each prytany, that is, 40 times a year. On a famous occasion the lot fell to Socrates, whose tribe held the prytany at that crucial juncture, to act as president of the Assembly when the motion was brought to try as a group the generals who had been charged with dereliction of duty for failing to rescue survivors after a naval battle off Lesbos in 406 BC. Because he was unwilling to contravene a law requiring defendants to be tried individually and not as a group, Socrates refused to have any part in the proceedings. He was replaced by someone (whose name is not recorded) more willing to compromise his principles and connive at illegality.

No councillor could serve more than twice in his lifetime, and then not for two years in succession. Thus, there was no possibility of a cadre being formed, or the development of any

continuity of interest, especially covert. Figures for the total population of Athens in the Classical period can only be guesses, and estimates of the percentage of male Athenian citizens who would have served on the Boule at least once in their lifetimes range between one-third to one-half (J. O'Neil) and 70 per cent (R. Osborne). The whole system was one of absolute equality. Men of varying interests, abilities, and backgrounds served together, on a temporary basis, and because of the transregional nature of the tribal membership noted above, it was the city as a whole whose needs were being served, not those of individual districts, nor of segments or interest groups within the population.

There is evidence of a cult of Demos, the Athenian populace conceived of as a collective abstraction, on the Hill of the Nymphs near the Pnyx at Athens from before 450 BC. Before the end of the 5th century the abstractions Demokratia and Oligarchia appear as personified opponents, and a cult of Demokratia is attested on inscriptions from the 330s. In this period also Boule, the personified Council, appears as a parallel abstraction. A surviving relief sculpture on a decree dated 337/6 from the Athenian Agora shows Demokratia crowning a dignified-looking, sceptred Demos who is seated on a throne. Athens was not alone in iconographically honouring Demokratia, for a statue of the goddess is depicted on a coin of Cnidus dated 300–190 BC.

Democracy defined the Athenian political ethos as at no other ancient Greek city, but there are traces of democratic periods elsewhere: Syracuse, Mantineia, Argos, Corfu, Rhodes, Thurii, Tarentum, Heracleia on the Pontus, Thasos, Epidamnus, and possibly Megara. When at the height of their imperial power, the Athenians tried to impose their democratic system on various dependent states, among them Boeotia and, in Ionia, Erythrae and possibly Miletus.

Aristophanes in *Knights* and Plato, the comic writer, in a play whose title is not preserved made fun of Demos as a cantankerous old man all too willing to be flattered, duped, and led astray by wily but unprincipled politicians. Other critics, such as the historian Thucydides and the philosopher Plato, were more scathing. What such critics feared was the tendency of an electorate to disintegrate into an unruly mob, like (in Plato's vivid image) a raging beast, unwilling to take direction from enlightened (i.e. aristocratic) leaders and yielding instead to the self-serving cajolery of (plebeian) demagogues. This continues to be the paradox of any modern democratic system, where large populations and an inflated governmental apparatus seem to require some kind of representation rather than the direct democracy of ancient city states: since election to office today depends upon heavy financial outlay by candidates, who, if elected, must then spend much of their time trying to divine the voters' sometimes only vaguely formulated and often inconsistent desires, the term "politician" has become more a label of disparagement than a job description.

Long after Athens had lost any claims to importance on the world stage or independence of political action, it maintained the forms of its democratic past: a decree survives from about AD 220 mandating a revival of the Eleusinian festival that opens with the characteristic formula, "It was decreed by the Demos". Such associations with popular government, however, gradually lost favour during the Roman period. By the 5th century AD the word "democracy" had acquired distinctly adverse connotations and for the Byzantines it came to mean a popular disturbance or riot.

Demography

Demography as a scientific study of the size, distribution, and composition of human populations did not exist among the ancient Greeks. Moreover, in studying the population of ancient Greece and the relations between its component parts (such as old and young, male and female, slave and free, etc.), modern demographers are hampered by the lack of reliable figures and statistical information.

After the rediscovery and spread of the art of writing, and at least from the 6th century BC, the Greek states must have kept records concerned with the status and duties of citizens or with financial obligations and benefits, but such records would have applied to free men rather than slaves, and to adult men rather than women and children except in so far as these latter were involved in matters of citizenship. There are more inscriptions from the 4th century BC onwards, but these are generally religious, social, or honorific and it is uncertain to what extent local figures of population levies were consolidated and recorded in any permanent fashion.

Due to the emphasis that ancient historiography placed on warfare, most available data relate to the size of military forces or to the manpower available for military purposes. In other words, they refer only to adult male citizens. From such numbers attempts have been made to estimate the size of the entire population including women, children, and slaves. For example, Gustave Glotz's estimate (in *Ancient Greece at Work*) of the population of Attica during the Classical period is based on the number of Athenian hoplites at the beginning of the Peloponnesian War, as stated by Thucydides: according to this calculation there were then some 40,000 adult Athenian citizens of all classes, making with their families a total of 140,000, with about 70,000 metics and probably between 150,000 and 400,000 slaves.

Censuses of citizens were rare in the ancient Greek world. Only one census is recorded for Classical Athens, the one carried out by Demetrius of Phaleron in the late 4th century BC, whose results are preserved by Athenaeus (6. 272c). No results for Greece or any other region are preserved from the Roman censuses mentioned in the Gospel story of the birth of Christ (Luke 2: 1–2).

Information regarding changes in settlement patterns in ancient Greece, probably connected to population fluctuations, is supplied by intensive archaeological field surveys. Although there are local variations during all periods, the general pattern is of a sparsely populated landscape in the 11th and 10th centuries BC, followed by a substantial increase in most areas from the 9th century BC, culminating in the period from the 5th to the 3rd centuries BC and declining in the last two centuries BC and during the Roman empire. It is thus possible to accept the growth of population as at least a partial cause of Greek colonization from the 8th century BC onwards, as it undoubtedly was after the time of Alexander the Great. It is, however, difficult to say whether the colonizing activity of the Archaic period led to a long-term reduction of population in mainland Greece. This activity continued until the 6th century BC, after which there was opposition in the West from the Carthaginians, Etruscans, and Illyrians; and the suitable sites around the Aegean Sea were all occupied. Cities then began to grow, and to produce goods, with the help of captured slaves, partly in order to pay by exports for the corn they now had to import.

There were no birth or death certificates in ancient Greece and, consequently, ages given in literary sources are generally unreliable. However, a study of the relationship between the age and sex of a skeleton and particular grave goods can be useful in the investigation of prehistoric social organization (Halstead, 1977). Study of the skeletal remains of male individuals of the Early, Middle, and Late Helladic periods from the Greek mainland and the islands reveals a morphological homogeneity of the population throughout the Bronze Age (Xirotiris, 1980).

A high level of infant and child mortality in Classical Greece is suggested by excavations of cemeteries. There is even less evidence for fertility rates than mortality rates, but fertility levels must have been much higher than in advanced modern societies. For, although family limitation measures such as infanticide or abortion may have been practised in some social classes, religions, or periods, the high infant mortality must have encouraged large families to ensure that some children reached adulthood to inherit the property, provide additional farm labour, and support the parents in old age. A very important factor influencing fertility levels is the average age of marriage, particularly for women, and the few references in literary sources (e.g. Hesiod, *Works and Days*, 695–98) suggest a pattern of late marriage for men (around 30) and early marriage for women (mid- to late teens), the latter making high fertility rates possible. In their ideal states both Plato and Aristotle provided that parents should breed only when in their prime. Plato puts this for women at from 20 to 40 years of age, for men from the end of their prowess at racing until 50 (just like stud horses). Aristotle wished women to marry at 18, men at 37: they were then in the prime of life respectively, and the decline in the powers of both would coincide.

On the other hand, the emancipation of women in the Hellenistic age was accompanied by a revolt against wholesale motherhood, and the limitation of the family became the outstanding social phenomenon of the age. Abortion laws became more lenient, and exposure of children more common. In the old cities families raising more than one daughter would be one in a hundred: according to Poseidippus, "even a rich man always exposes a daughter". Sisters were a rarity, but one-child or childless families were common. Around 200 BC, out of a total of 79 Milesian families, 32 had one child, 31 had two; altogether they had 118 sons and 28 daughters (Gustave Glotz, *Ancient Greece at Work*, 1965, p.298; W.W. Tarn, *Hellenistic Civilisation*, 1927, p.86). At Eretria only one out of 12 families had two sons, and hardly any had two daughters. Infanticide received the approval of some philosophers (though not of Socrates/Plato in the *Republic*, who recommends only the separation of inferior children from the guardian class: cf. Mulhern, 1975) as a means of reducing the pressure of population; but the practice spread among the masses to such an

extent that the death rate overtook the birth rate. The extent of family limitation may be gleaned from the fact that by forbidding it Philip V of Macedon raised the manpower of his country by 50 per cent in 30 years (Tarn, p.88). Around 150 BC Polybius (36. 17) lamented the desertion of the cities and the unproductiveness of the land resulting from a low birth rate and a general decrease in the population. He ascribed this to selfishness and indolence, and to a desire to give one's children too high a standard of living. But it may equally well have been due to demoralization and reluctance to bring children into a world of incessant war, revolution, banditry, and violence in general, with a high chance of poverty, enslavement, or early death. And if it is true that Aemilius Paullus, after defeating king Perseus of Macedon at Pydna in 167 BC, carried off 150,000 into slavery from the region of Epirus alone, there we have an example of one cause of depopulation, and of demoralization among the remnants (Wilkinson, 1979, ch.1).

It has been suggested that some 10 per cent of females may have been exposed at birth in order to avoid an excess of marriageable women (Golden, 1981). But this hypothesis cannot be demonstrated, and would require the unwarranted assumption that the Graeco-Roman era had a sustained surplus of births over deaths. It has been pointed out that a high rate of female infanticide was impossible for any ancient population since it would cause a decline in a nearly stable population (Engels, 1980, 1984).

Our extant evidence is mainly concerned with Athens and largely confined to the 4th century BC. It consists of fragmentary sources such as lists of *epheboi* (young men undergoing military training), *bouleutai* (councillors), and *diaitetai* (elderly men serving as arbitrators). It is not clear whether these groups were recruited from the entire body of adult male citizens or from only among the hoplites and the upper classes. According to Hansen (1989) ephebic rosters cannot be used to calculate accurately the total number of Athenian citizens during the 4th century BC. Every Athenian boy of 18 was registered in the deme of his father, and the total of these deme registers formed the list of those entitled to take part in the assembly. Similarly there were lists of 18-year-old boys eligible to become *zeugitai* liable to hoplite service and *thetes* liable to service in the Athenian navy. Both boys and girls were enrolled in their phratries, but there were no other records of citizen women. Demetrius' census enumerates 21,000 citizens, but it is uncertain whether this figure includes all citizens or merely those liable and fit for hoplite service. The number of metics, which is given as 10,000, is the only figure for this status group that has come down to us. Metics were required to pay a tax and were registered in their deme of residence.

The suggestion of Herodotus (5. 97. 2) that there were about 30,000 Athenian citizens in the early 5th century BC has sometimes led to the indiscriminate assumption of this figure for the rest of the Classical period as well. However, evidence of the size of Athenian military forces during the 5th-century BC empire suggests that by the middle of that century there were at least 50,000 or possibly even 60,000 citizens, thus indicating a substantial growth since the early 5th century BC. This level was maintained until the beginning of the Peloponnesian War, when it began to decline as a result of the plague and the heavy casualties in battle, especially during the expedition to Syracuse in 415–413 BC. Moreover, after the introduction of Pericles' citizenship law of 451 BC, the Athenian citizen population was doomed to be stationary or to decline. Any significant increase in the number of citizens was ruled out by the strict rules for accepting new citizens combined with the continuous emigration from Attica (Hansen, 1982).

Most uncertain of all is the number of the slave population. The Athenian census of Demetrius records their number as 400,000, and similar incredibly high figures are given for Aegina and Corinth as well in sources of varying reliability. Thus, around 350 BC, Aristotle calculated that Aegina had a population of half a million, of whom 470,000 were slaves (Calhoun, pp.30–31). Nevertheless, there may have been considerably more slaves in the time of the 5th-century BC Athenian empire than there had been earlier.

Although Laconia had much of the richest land in Greece, it was thinly populated. According to Herodotus (7. 234. 2; 9. 10. 1), Sparta had 8000 potential soldiers in 480 BC, and in 479 BC 5000 actually took part in the Battle of Plataea. However, by Aristotle's time the citizen population seems to have come down to fewer than 1000 and the causes of this decline have been much debated: such diverse factors as the structure of Spartan society, casualties in war, inheritance patterns, and the earthquake of *c.*464 BC have been invoked to explain it. In the opinion of Aristotle (*Politics*, 1270a29–34) this serious problem of manpower shortage was the reason for Sparta's downfall. Yet we must remember that the citizens comprised only a small proportion of the total population. Although figures for the number of Spartiates between the ages of 21 and 50 and *perioikoi* ("dwellers round") in the army are given, their proportion to the total number of Spartiates or *perioikoi* can only be conjectured. The number of helots is still less well known, except that they were relatively more numerous in proportion to the free population than were serfs in any other state. At all events we know that at some time Sparta introduced severe penalties for celibacy as well as rewards for child-bearing. It was seriously concerned even about the loss of the 124 Spartiates trapped by the Athenians on the island of Sphacteria in 424 BC. By the time of its debacle at Leuctra in 371 BC it had only 1000 of these; whereas Aristotle calculated that its territory could have maintained 30,000 infantry and 1500 cavalry. An unwillingness to breed because of a decadent obsession with personal wealth seemed to be the chief cause of the population decline. Nor was there, as in Athens, a strong religious cult of ancestors to motivate perpetuation of the family.

The citizen population of Argos and Boeotia during the 4th century BC may not have been dissimilar to that of Athens, to judge from their military strength, but they probably had fewer resident aliens and slaves. Corinth, which in the 5th and 4th centuries BC had less than half the hoplites of Athens, may have had half as many inhabitants as Athens, if not fewer. The poor and mountainous country of Arcadia produced many emigrants; and yet it had 6000–7000 hoplites in the 4th and 3rd centuries BC. By comparison with Attica this would mean a citizen population of about 80,000–90,000. On the other hand, the prosperous Greek colonies of Sicily and Italy were densely populated and, despite the lack of evidence, we may assume that the size of their populations exceeded that of virtually every state in mainland Greece. To take just one example,

according to Diodorus Siculus (3. 9) the wealthy and prosperous city of Sybaris had 300,000 inhabitants.

Sources for demography in the Byzantine age are also fragmentary. Apart from some judicial compilations that provide insights regarding the size and stability of litigant families, one has to depend on physical evidence or surviving government records. From the size and number of excavated houses A. Jakobson (in *Vizantijskij Vremennik*, 19 (1961): pp.154f.) estimated a population of 5000 for the average 10th- or 11th-century city. Evidence for births and mortality from funerary inscriptions is often insufficient or unsuitable for statistical analysis. The most important sources are the *praktika* (tax records), primarily of 14th-century southern Macedonia. Many offer detailed listings for members of peasant families dwelling on the estate; since a number of areas were assessed repeatedly, their *praktika* give some indications concerning household stability. However, being fiscal documents, they tend to omit what is considered not essential for taxation. Thus the ages of the population are not recorded, and it is not certain at what age a child was first enrolled. It is also possible that women, when not acting as heads of households, were persistently undercounted, and insufficient account appears to have been taken of newly arrived families or those who no longer worked on the estate but might remain in the same (or a neighbouring) village (D. Jacoby, review of *Peasant Society in the Late Byzantine Empire* in *Speculum*, 61 (1986): pp. 677f.). Isolated population figures for individual cities during particular periods are provided in literary sources.

The population of Byzantium grew steadily during the 4th and 5th centuries AD but declined precipitously during the 6th and 7th under the recurring impact of famines, plagues, and foreign invasions; this was followed in turn by a period of slow recovery. The empire lost a large portion of its population with the territorial losses of the late 11th century; and from 1200 onwards the population in the remaining areas appears to have dropped continuously. During the 14th century this downward trend was accelerated by civil wars, the Black Death, and the disruptions caused in Macedonia by marauding mercenaries of the Catalan Grand Company.

Modern Greece has a total area of 131,990 sq km, of which the mainland constitutes 81 per cent (106,821 sq km) while 19 per cent (25,169 sq km) is taken up by the islands. In 1861 there were 1,096,810 inhabitants, 567,334 male and 529,476 female, with a density of 23.08 per sq km. By 1991 there were a total of 10,264,156 inhabitants (77.78 per sq km), 5,029,710 of whom were male and 5,234,446 female. By 1996 the population had risen to 10,475,000 with a density of 79 persons per sq km. The urban population was 65 per cent in 1994 as opposed to 43 per cent in 1960.

The urban network of Greece is structured as a whole around two poles of different importance, Athens (population 3,096,775) in the south and Thessalonica (739,998) in the north. The periphery of these metropolitan centres is occupied by a series of satellite cities of varying size. The only other cities with a population of more than 100,000 are Patras (172,763), Volos (106,142), Larissa (113,426), and Herakleion in Crete (127,600). Like the rest of Europe, Greece has low birth rates and a rising trend in the average age of the population. Life expectancy is 77.8 years, and adult literacy 96.7 per cent.

In the recent past migration (both internal migration and emigration) was a significant feature of Greek demography. Internal migration was high before the 1980s and was reflected in the falling population figures for the mountainous areas and the islands. However, this trend has stopped since the 1980s so that these regions now show an increase of population. Emigration to America has been going on since the end of the 19th century while emigration to Australia, which began after 1945, has been supplemented since the 1960s by labour migration to Western Europe in general and to Germany in particular. However, the process of emigration has more or less come to an end, and remigration is stronger at present than outmigration, which remains steady at quite a low level. In fact, the faster growth in population when compared with the rest of Europe is due less to fertility than to high immigration and remigration.

Although Greece has on average a low population density, there are sharp regional variations. Attica is the most thickly populated area, while the mountainous regions and the islands have a low population density. Regarding fertility, there are no significant regional variations: the fertility rate in all regions is below the European average, and is now below replacement level. The mortality rate is also very low, and life expectancy is rather high, despite the low expenditure on health by the government. The infant mortality rate is somewhat higher than Europe on the average, but there is no fundamental difference in the age structure. Central Greece, Crete, and the Aegean islands have a smaller active age group and a higher proportion of elderly than the rest of the country, reflecting the consequences of internal migration processes, with the active persons migrating to the big urban centres while the young and the old stay behind. Compared to the rest of Europe, the female activity rate is lower (by more than 10 per cent), youth unemployment is much higher (except in the islands), and the annual growth-rate of the population is still somewhat higher (0.1 per cent) and on the increase although, as mentioned above, this last may be due to a much higher net migration.

Demons and Spirits

Our word "demon" comes from the ancient Greek *daimon*, from the verb *daiein*, "to distribute". In the Homeric and Classical periods *daimon* could be used as a synonym of *theos* to mean simply "god". More frequently, however, *daimon* referred to "divine power" in the abstract as opposed to the personified deity denoted by *theos*. In a wide range of Classical sources *daimon* could mean "the power controlling the destiny of individuals". It carried overtones of "a portion" (*moira*) in the sense of "fate". A *daimon* was both the distributor of destinies and the destiny itself.

In contrast to the Olympian gods, the *daimones* were not honoured by any cult or shrine within the polis. Nor were they represented in myth, drama, vase painting, or sculpture. They were a nameless, ill-defined plurality of supernatural beings, yet this semantic vagueness suited them for new applications in the course of time, especially in the area of psychology.

A productive set of meanings for *daimon* derived from Hesiod, according to whose *Works and Days* the souls of men from the golden age became good *daimones* who watched over and protected mortal men. In the *Timaeus* Plato allocated them to the *aither* (upper air), above the *aer* (lower air) where heroes and departed souls resided. Souls and *daimones* alike were physically composed of *aither*, a mysterious fifth element (*quinta essentia*). The *daimones*' position between heroes and gods was not, however, stable, and Plato elsewhere equated all fallen soldiers with *daimones*, while during the Hellenistic period any deceased person could be called a *daimon*. In this sense *daimon* came close to the ideas of soul (*psyche*) and spirit (*pneuma*).

Daimones also had associations with human emotions, beginning with the *Symposium*, where Diotima introduced Eros as a *daimon*. Plato furthermore (*Timaeus*, 90c) considered that humans should pursue learning and true thoughts in order to achieve "happiness" (*eudaimonia*) – a state in which the good internal *daimon* comes to the fore. It was Plato's pupil Xenocrates who conceptualized demons as dark, lustful forces, thereby initiating the shift of the *daimones* from elements of a scientific, philosophical cosmology to elements of a moral one. This would be a slow and uneven transition lasting centuries and not definitively finishing until the rise of Christianity. During the Hellenistic period *daimones* continued to be treated as intermediaries. For example, it was thought that they sent dreams. In Neoplatonic magic, as represented by the Chaldaean Oracles, the *daimones* could be addressed and their aid enlisted through elaborate rituals involving the spinning of a top, or *iunx*. Alternatively, messages enlisting demonic help against an enemy could be written on lead tablets and buried along with the dead. Or the *daimones* could be appealed to, or controlled by resort to more powerful gods, through elaborate spells recorded on magical papyri.

The Christianization of the Greek-speaking world did much to polarize the demons as exclusively evil spirits located on, or in, the earth. The already many-stranded traditional conception of *daimones* was reorientated by the Judaeo-Christian story of Satan who, in an act of hubristic jealousy, attempted to place his throne higher than God's. In recompense he was cast down from the heavens, along with his conspiring angels who became demons – a word that, through phonological

changes in the language, was now pronounced *demones* (as indeed it still is in modern Greek). Demons in the Christian world were unequivocally evil, associated with matter, sin, corruption, and the body, as opposed to the values of Christian purity, restraint, and spirituality overseen by God and Christ.

"The gods of the gentiles are demons", the early Church Fathers exhorted. Thus, in the baptismal ceremony that converted pagans into Christians evil spirits were exorcized from the body of the initiate who was then instilled with the Holy Spirit. Finally, in the act of chrismation, his or her sensory organs and bodily orifices were symbolically "sealed" against future demonic incursions. Possession by demons was nonetheless still a danger and the priesthood retained the power to perform exorcisms just as Christ did in the New Testament. One of the primary techniques in Greek Christian exorcism was, and still is, to learn the name of the demon. If one can name a demon, one can control it, and this is accomplished either by verbally abusing the demon, or by reciting long lists of demonic names in the hope that one of these may be correct.

Christianity called for spiritual refinement as a means to ultimate union with God. This meant constant combat with dangerous passions and desires that threatened moral perfection. The monastic tradition, beginning with St Antony in the 4th century, offers many detailed accounts of how the Devil, or demons, tempted monks to stray from the path of goodness. The "deadly sins" – stabilized at seven in the Catholic west, but fluctuating between seven and eight in the Greek east – were conceptualized as demons that attacked one and had to be fought off by ascetic cultivation of the appropriate Christian virtues. Monastic texts such as those compiled in the *Philokalia* developed a chain-effect explanation of the emotions whereby submission to a particular demon "of the first rank" brought increased vulnerability to certain other demons in its wake. These demonologies were precursors of contemporary psychology.

The Orthodox Church oversaw a standard, or doctrinal, conception of demons according to which the Devil's helpers were fundamentally immaterial, powerless, and plural. This perhaps explains why the iconography of demons and the Devil did not begin much before the 7th century. That such an iconographic tradition did finally begin might be taken to indicate the pressure that alternative traditions exerted on the Church. Local popular beliefs attributed more independent power and specific characteristics to demons than Church doctrine would allow. Different views on this matter were at the root of high medieval dualist heresies such as Bogomilism, which asserted that the entire earthly world was demonic.

In modern Greece folklorists and anthropologists have uncovered a wide range of Greek beliefs in demonic supernatural beings such as the *neraides*, dangerous female spirits, or the *gelloudes*, child-snatching demons. Some of these, such as the above, bear names that connect them to ancient Greek supernatural beings. If they were not initially demons, then the Church has succeeded in demonizing them over the years. Demons in contemporary Greece – not uniformly believed in by a late 20th-century population exposed to modern science – form a large category comprising 30 or more differently named spirits known generically as *xotika* (things from outside), *aerika* (air spirits), or *demonika*. They account for illness or misfortune in terms that make them morally intelligible at the personal level, something universal science is unable to do. Throughout Greek tradition demons have always served as a labelling and categorizing principle enabling people to chart and comprehend the unknown, whether in outer space or in the recesses of the human psyche.

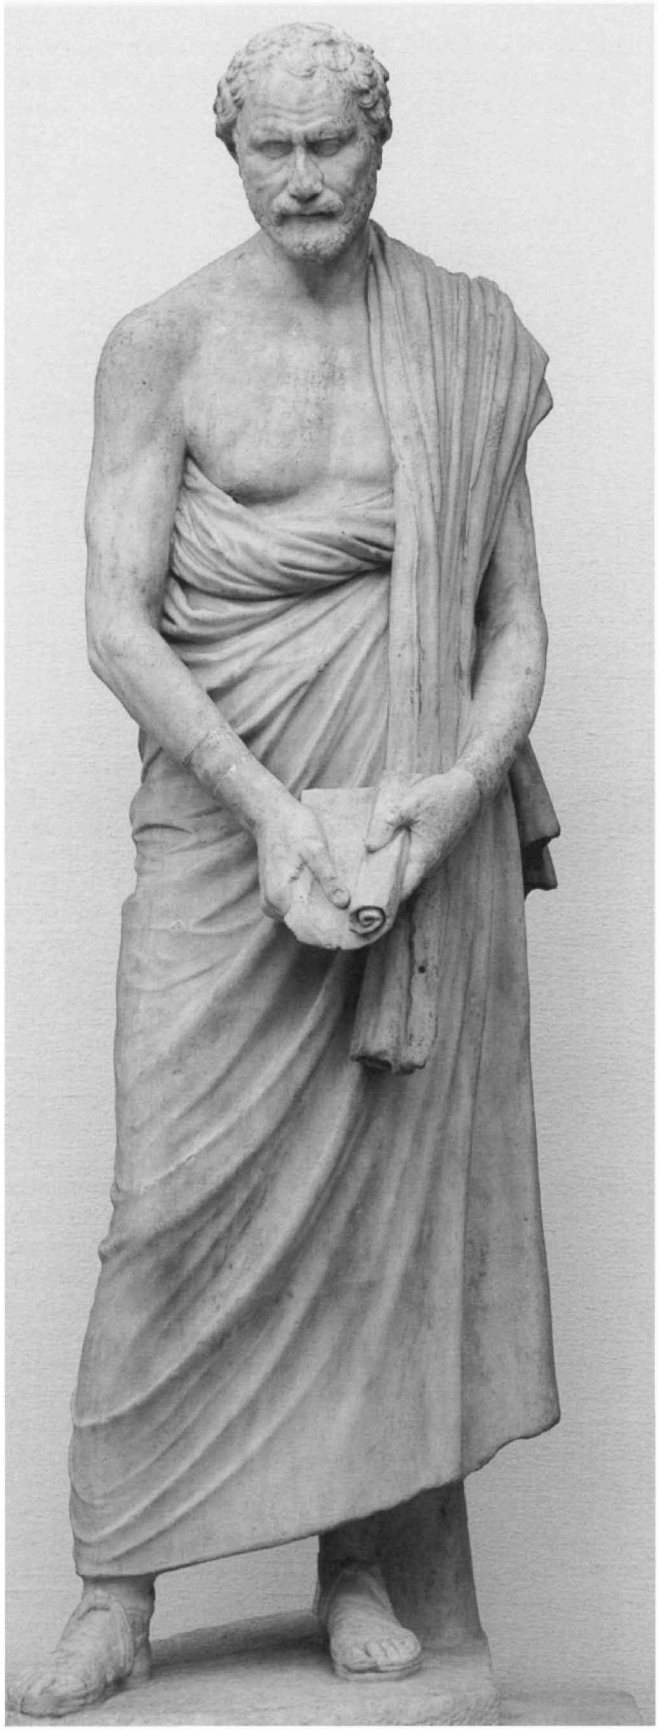
Demosthenes 384–322 BC

Orator

Demosthenes was the son of a wealthy Athenian manufacturer of swords and cutlery. His father died when he was 7 years of age, leaving him under the control of three guardians who embezzled most of the inheritance. After studying rhetoric with Isaeus, Demosthenes began a series of prosecutions against his former guardians and recovered some of the lost money (364 BC), but more significantly, gained a reputation as a speech writer. He also taught rhetoric, but he had grander ambitions and overcame a speech impediment by practising declamation with pebbles in his mouth and shouting above the noise of the waves at Phalerum.

Demosthenes' political career began in 355 BC, when he was commissioned to write *Against Androtion* for a political trial. In the early period he may have opposed the policy of Aristophon, who was advocating war with Persia, and he attacked Eubulus in *On the Syntaxis* (353/52 BC). By 351 BC he recognized the dangers posed by Philip II and delivered the unsuccessful *First Philippic*, followed by the three *Olynthiacs* (349 BC). In the third of these Demosthenes alludes critically to Eubulus' policies, which in 348 BC led to costly Athenian intervention in Euboea. In the same year he became involved in liti-



Demosthenes, the great Athenian orator, Ny Carlsberg Glyptothek, Copenhagen

gation against Meidias, a leading supporter of Eubulus, who slapped Demosthenes' face at the Dionysia. The *Against Meidias*, however, was never actually delivered, since the two reached an out-of-court settlement.

In 348 BC Demosthenes successfully defended Philocrates, when he was prosecuted for proposing negotiations with Philip, but soon afterwards Olynthus fell, and Demosthenes helped to secure the Peace of Philocrates (346 BC). Aeschines attacked Demosthenes for the poor part he played in the negotiations, and it was Aeschines who championed the treaty before the assembly, which knew that Philip was already threatening Phocis. It is unclear what Demosthenes tried to propose at this meeting before being shouted down, but he subsequently worked to undermine the peace, gathering supporters to strengthen his anti-Macedonian position, including Hyperides and Lycurgus. He was also plotting his revenge on Aeschines, claiming that he had been bribed by Philip, but his attack on him through the agency of Timarchus was a failure. This was, however, only a temporary setback. In 344 BC, with Philip interfering in Thessaly and rumours circulating about his proposed intervention in the Peloponnese, Demosthenes persuaded the assembly not to renew the peace by his *Second Philippic*. Hyperides successfully prosecuted Philocrates (343 BC), while Demosthenes prosecuted Aeschines with *On the False Embassy*. Demosthenes' case was weak, but despite the support of Eubulus and the prominent general Phocion Aeschines was only narrowly acquitted.

In 342/41 BC Philip turned his attention to the Chersonese, threatening Athens' corn supply from the Black Sea, and his supporters in Athens demanded the recall of Diopeithes from Thrace. Demosthenes supported Diopeithes in *On the Chersonese* and the *Third Philippic*, one of his finest speeches, in which he spelled out Philip's designs on Greece and urged the Athenians to defend the Chersonese and Byzantium. An alliance was formed with Byzantium (341/40 BC), and although Philip seized Athens' corn fleet, his advance on Byzantium was checked. Demosthenes was now supreme in Athens and had the allocation of surplus revenues to the Theoric Fund suspended, but could not prevent Aeschines fomenting a Sacred War in 339 BC. Philip marched into Phocis and took Elatea, and Demosthenes persuaded the Athenians to make an alliance with their old enemy, Thebes. The allies met Philip at Chaeronea, but were crushed (338 BC).

Demosthenes continued to work energetically on the city's behalf after the Macedonian conquest and delivered the public Funeral Oration of 338 BC. In 337/36 BC he was theoric commissioner, and Ctesiphon proposed that he be honoured with a gold crown at the Great Dionysia for his services to Athens. Aeschines immediately indicted Ctesiphon for making an illegal proposal, but let the case drop because the political climate in Athens changed with the death of Philip. After Alexander had reestablished Macedonian control and defeated Persia, Aeschines resumed his attack (330 BC), blaming Athens' troubles on Demosthenes, but Demosthenes' masterpiece, *On the Crown*, easily won the day. He remained a prominent figure in Athens until the Harpalus affair (324 BC). Alexander's treasurer Harpalus arrived in Athens with a vast sum of money, and Demosthenes proposed that he be imprisoned and the money stored on the Acropolis. Harpalus escaped, and it was discovered that some of the money was missing. The

Areopagus cited Demosthenes, who was prosecuted by Dinarchus and Hyperides; fined 50 talents, he retired into exile. He returned to Athens after Alexander's death (323 BC) and advocated renewed resistance to Macedon in the Lamian War, but the Greeks were defeated at Crannon by Antipater (322 BC). Demosthenes, Hyperides, and their supporters fled; Demades proposed that they be sentenced to death, and Demosthenes committed suicide on the island of Calauria.

Judgements of Demosthenes' leadership have inevitably been affected by the brilliance of his speeches, and his championing of liberty tends to be seen in too simple a contrast to the servile acceptance of Macedonian rule by his opponents, whom he constantly accused of being bribed. In truth, other politicians were probably making proposals that stood a greater chance of success in maintaining Athens' freedom, particularly the uniting of the Greek states in a common peace. Athens alone lacked the resources to resist Philip in the way Demosthenes advocated, and his policy of fighting a war in the north was not popular with other Greek states, who realized that a successful outcome would result primarily in the greater glory of Athens. But this is not to deny Demosthenes' stature as one of Athens' greatest leaders.

From the literary point of view Demosthenes has been recognized by both ancient and modern critics as the best of the Attic orators. One of his outstanding qualities was the ability to vary his style to suit the occasion of the speech. There is some evidence that the speeches, always carefully prepared, were revised for publication, but Demosthenes creates an impression of spontaneity by mixing long periods with shorter, simpler sentences. He tended to avoid hiatus and also runs of more than two short syllables. There is disagreement over how far this was a conscious rather than instinctive practice, but its effect is one of solemnity and dignity. Demosthenes writes in pure Attic Greek, and in narrative passages he regularly employs a plain style of writing; but elsewhere his sentences can be quite complex. He uses repetition, bold metaphors, and colloquialisms, varies his tone, and indulges in the vulgar personal abuse that was popular in his day. It was the combination of simplicity and complexity into a "middle" style that the Augustan critic Dionysius of Halicarnassus regarded as producing the most effective oratory.

The Demosthenic corpus comprises 60 speeches, an *Erotic Essay*, a collection of 56 proems (prefaces, written as models for imitation by his pupils), and six letters; but a number of the private orations, the *Funeral Speech*, and the *Erotic Essay* are spurious. His earliest forensic speech, *Against Aphobus I*, already displays the hallmarks of Demosthenic oratory, with its forcefulness and variety, and a somewhat imperious ethos. Demosthenes continued writing speeches for wealthy clients throughout his life, though he did not appear in person in private cases after the late 350s BC but even private suits might have their political side. He composed *Against Stephanus I* (349 BC) for Apollodorus, when he was prosecuting Stephanus for perjury on behalf of Apollodorus' stepfather, the banker Phormio. He attacks Phormio bitterly, yet at the original trial in 350 BC he had written *For Phormio*, in which he bitterly attacked Apollodorus. Demosthenes probably changed sides because Apollodorus had begun, like Demosthenes, to advocate the use of the Theoric Fund to finance the struggle against Philip, but centuries later Plutarch criticized his morality.

Demosthenes' forensic speeches cover a wide range of subjects in both private and public cases, and demonstrate a talent for character portrayal and logical argument. One of his best private orations is *Against Conon*, an action for battery brought by Ariston. In a vivid narrative Ariston tells how he first met Conon's permanently drunk sons and describes the fight in which he was nearly beaten to death, though the decent youth cannot repeat the abusive language used by his brutal attackers. Demosthenes is an unashamed patriot, and national character is the underlying theme of many of his most famous speeches, both political and judicial. In *On the Crown* he gives an extended account of his public services and conceals the fact that his policy had failed at Chaeronea by emphasizing Athens' greatness – and his own role as the city's greatest champion.

Demosthenes' patriotic stance against Philip and his judicial defeat of Aeschines laid the foundations for his reputation in the later Classical world and beyond. A full-length biography was composed in the 2nd century AD by Plutarch, who paired Demosthenes with Cicero in his *Parallel Lives*; an extensive life is found in the pseudo-Plutarchan *Lives of the Ten Orators* of the same period; while briefer notices were written by Libanius and Zosimus (one of various scholars of that name living in the 5th–6th centuries AD). In the 9th century Photios wrote a biography based on pseudo-Plutarch, and further biographical details may be found in the *Suda*. This material is generally favourable, and St Nicholas of Myra regarded Demosthenes as the embodiment of virtue, in stark comparsion with Aeschines. But a hostile tradition is represented by Tzetzes, who perversely makes Demosthenes rather than Aeschines the venal politician. Theodore Metochites (1270–1332) similarly compared Demosthenes in part unfavourably to Aelius Aristides, though he regards Demosthenes as the greater rhetorician. Finally, a statue of Demosthenes was placed in the Baths of Zeuxippos in Constantinople and described by the 5th /6th-century poet Christodorus of Coptus.

Demosthenes' speeches were, in the eyes of most critics, the supreme models for imitation. Already in the 2nd century AD they were being drawn on extensively by rhetoricians such as Hermogenes, who calls Demosthenes "The Orator". Hermogenes' use of Demosthenes is highly significant, since later rhetoricians were in turn deeply influenced by him. Tiberius wrote *On the Figures of Demosthenes* in the late 3rd or early 4th century AD; Epiphanius the Syrian, a candidate for the chair of rhetoric in Athens after the death of Julian of Caesarea (*c.*AD 330), wrote a commentary on Demosthenes; and, most famously, in the 4th-century AD Libanius of Antioch wrote *Hypotheses* to the speeches in Constantinople. The *Suda* attributes another commentary to Zosimus. In the 6th century AD Choricius used Demosthenes as a model for his speeches; the curriculum in the schools of rhetoric in this period included the Attic orators, especially Demosthenes, as well as Isocrates and Aeschines, and extensive use of Demosthenes is attested by the numerous scholia – and by the abuse of Demosthenes, along with Homer, Plato, and Aratus, in the hymns of Romanos. The earliest manuscripts of Demosthenes are datable to the 9th and 10th centuries AD, when the revival of interest in the Classics led to further activity by scholiasts. Numerous papyri have also been recovered from Byzantine Egypt (they indicate the position of Demosthenes alongside Homer, Euripides, and Menander as one of the central

Classical authors), and Demosthenes' position as the greatest Classical Greek orator and the best source of suitable material for quotations was maintained throughout the Byzantine period to the 15th century. In the 11th century Michael Psellos compared Demosthenes with Gregory of Nazianzus, who synthesized Classical rhetoric and Christianity; while in the 12th century Gregory of Corinth recommended Demosthenes among his models for deliberative and judicial oratory. His rousing *Philippics* in particular have ever since been seized on by politicians: during the War of Independence the *Appeal to the French People* recalled the place of Demosthenes in Greece's glorious past, while in 1827 Lord Cochrane quoted the *First Philippic* to Kolokotronis in an exhortation to unity.

Biography

Born into a landowning Athenian family in 384 BC, Demosthenes studied rhetoric under Isaeus and became a professional speech writer. His political career began in 355 BC when he initially advocated peace, against the policy of Aristophon. By 351 BC he recognized the threat to Greece posed by Philip II of Macedon and devoted the rest of his career to warning aginst it. Despite the defeat at Chaeronea (338 BC) Demosthenes remained in office until 324 BC when he was charged with corruption. In 322 BC he fled and committed suicide on the island of Calauria.

Dialectic

Dialectic is variously a practice, a method, and a science in Greek philosophy. The basic precept of dialect is based on conversation – and perhaps disputation – between at least two distinct parties. Dialectic lies at the very heart of all Greek philosophy and represents one of its most characteristic contributions to the sum of human thought.

The modern English word is a near-transliteration of the Greek word *dialektike*, meaning "the art or skill of discussing". Conversational encounters, as the ancient Greeks knew, may consist of unproductive pleasantries, or be hostile confrontations, or serve as mutually productive exchanges between two minds concentrating on the same issue from different initial perspectives. Serious dialectic concerns the latter; but Greek philosophers realized that without proper regulation the exercise could degenerate into one of the other forms of encounter. The more pressing danger came from the tendency to ill-disciplined disputation, which was given the pejorative title of "eristic", or contentious argument.

We learn about dialectic mainly from the practice of Plato's dialogues, where there occur specimen dialectical exchanges interspersed with some comments on sound and unsound method, and more thoroughly from Aristotle's *Topics* and *Sophistici Elenchi*, which describe the practice of dialectic and set out his thoughts on its philosophical purpose and value. Dialectic continued to be studied after Aristotle, particularly by such early Stoic logicians as Chrysippus. However, by this stage dialectic had come to be included in the study of logic, with specific reference to the more pragmatic aspects of the theory of argument; there is little evidence of the actual practice of dialectic from this period. On the other hand, philosophers after Aristotle continued to exhibit a dialectical style in their handling of problems; and to that extent dialectic is an enduring feature of all Greek philosophy, not merely a dominant aspect of its seminal period in the 5th and 4th centuries BC.

In a dialectical exchange there is a clear division of function between two participants – the questioner and the answerer. An issue is proposed: for example, *Is virtue teachable or not?* or *Should we return to people what is their due or not?* The answerer chooses one of the two possible responses, and thereafter answers questions which are designed to lead him to say something incompatible with his original answer. The questioner holds the initiative, but the answerer is at liberty to respond at any stage as he sees fit. Rational insight, and even logical dexterity, are needed if the questioner is to elicit an answer which fails to cohere with the answerer's original response.

Dialectic hinges on winning or losing a contest, and its purpose is to advance the pursuit of truth. These aims were articulated as the exercise progressed, and a sense of their significance always imposed discipline and regulation on its conduct. For example, questions must be clear cut; they must not leave open a plurality of responses beyond a straightforward yes or no. Measures must be taken to avoid or expose ambiguity, whether in a single word or in a larger unit of language; otherwise the value of any particular dialectical response will be uncertain. By these means, those who practised and theorized about dialectical exercises came to assist the creation and development of logic. But all such dialectical rules or sanctions were themselves subject to appraisal and acceptance or rejection within the context of the particular philosophical encounter. Everything was subject to considera-

tion, save perhaps for the very freedom of enquiry which the exercise presupposed.

Plato had a strong insight into the potential of dialectic for the advancement of understanding. He understood that the open-ended, autonomous nature of the exercise made it an ideal method for securing knowledge which was based on deep and sustained conviction. The practised dialectician is able to defend his insights against every kind of attack; and how could there be a better basis than this for anyone to support a claim to have genuine knowledge?

Yet Plato was simultaneously developing stringent criteria defining what was to count as knowledge – for example, that it be not subject to revision, and that it be based on rational reflection. Thus he proposed that dialectic should be a science rather than merely a method. This revision was secured by placing dialectical method on a foundationalist basis; effective practice of the method was to be dependent on a grasp of the truth conveyed by an intuition of the nature of goodness. By using value as the fundamental concept of the science, Plato preserved a Socratic insight into the pervasive philosophical significance of matters of value, whatever particular topic might be under consideration. Nevertheless, the progression of dialectic from a method to a science transmutes an essentially open-ended sceptical stance into a commitment to the pursuit of certainty and truth.

Aristotle sought to restore dialectic to its earlier role as a training exercise and at the same time to establish its connection with the distinct spheres of science and philosophy. The philosophical value of dialectic resides both in its capacity for training and, above all, in its role in the examination of the scientific axioms. Dialectic can help those who wish to discover first principles; it provides an essential preliminary phase to the operation of axiomatic scientific demonstration. Scientists then take over the task of demonstrating the deductive consequences of these axioms.

Aristotle's practice when engaged in philosophy diverges somewhat from this official position. He begins almost every discussion – both of general topics and of detailed problems within them – with a review of previous views on the given question and an elaboration of the difficulties which are generated if we try to combine them. However, dialectical method dominates the entire discussion of these problems. It is not a preliminary, which will give place to a less tentative phase of enquiry in the subsequent examination. Instead, the teasing out of problems forms the very substance of Aristotelian philosophy, and in this sense philosophy is dialectical through and through.

In Aristotle the theory of dialectic is linked to the studies of logic and of fallacies. Many of the concepts of dialectic – such as argument, deduction, premise, and reduction – are also used in his theory of the syllogism. But logic is independent of the context of investigation, while dialectic is not. The study of fallacies, which Aristotle inaugurates in *Sophistici Elenchi*, is unintelligible without reference to dialectic. For example, the fallacies of many questions and begging the question arise essentially in a question-and-answer context, as their names make clear.

Many philosophers after the ancient Greeks have assigned philosophical significance to dialectic; perhaps the most notable in this company are Kant, Hegel, and Marx. Their very different interpretations and valuations of dialectic all owe much to the accounts of the matter in Plato and Aristotle. Moreover, the cut and thrust of dialectical method is still very apparent in the problem-oriented style of modern analytical philosophy. The original inspiration for this very fertile philosophical idea is firmly rooted in 5th- and 4th-century Greek thought, and it repays study in that context.

Dialects

Those Indo-Europeans who arrived in the Balkan peninsula in the late 3rd or early 2nd millennium BC – whom we may call the Proto-Greeks – were themselves members of a dialectal subgroup of the Indo-European family of languages and peoples. Common linguistic innovations suggest that the ancestors of the Greeks, Indo-Iranians, and Armenians spoke related varieties of late Indo-European. We would expect that even among that body of Proto-Greeks penetrating into the Balkans there was dialectal heterogeneity (if only on the sociological level), since all speech communities are linguistically heterogeneous. Beyond this, however, documentary evidence clearly reveals that by the mid- to late 2nd millennium BC, and much more so in the 1st millennium BC, the Greek language was characterized by distinct dialectal forms.

Before Michael Ventris's decipherment of the Linear B script in the 1950s, scholars had long been classifying the already known dialects of ancient Greek into several groups. With the decipherment of the Mycenaean tablets, yet another dialect was revealed – one that showed close similarities to certain of the post-Mycenaean dialects, though not complete identity with any. As analysis of the Mycenaean texts progressed, an awareness developed of the existence of not one, but two dialects preserved in the Linear B corpus (see Risch 1966; Nagy 1968; Woodard 1986). Moreover, folding the Mycenaean evidence into the analysis of Greek dialectology of the 1st millennium BC gave rise to speculation that no fewer than four distinct dialects of Greek must have existed in the Mycenaean era (see Cowgill 1966).

Those two attested varieties of Mycenaean Greek have been commonly dubbed "Normal Mycenaean" (since it is the more frequently occurring dialect) and "Special Mycenaean". There are at least four linguistic differences (or isoglosses) which distinguish the two dialects. Normal Mycenaean is character-

ized by each of the following features: (1) the third declension dative singular ending *-ei*; (2) the development of Proto-Indo-European syllabic nasals into the vowel *o*, in the vicinity of a labial consonant; (3) the change of **e* to *i*, also in the environment of a labial consonant; (4) the "assibilation" of inherited **ti* to *si*. Special Mycenaean, on the other hand, shows a distinct set of developments: (1) the corresponding dative ending is *-i*; (2) syllabic nasals become *a*; (3) **e* is preserved; (4) also preserved is the sequence **ti*. Of the four dialect features characterizing Normal Mycenaean, only one is attested among the known Greek dialects of the 1st millennium BC (the change of **ti* to *si*); otherwise it is the Special Mycenaean isoglosses alone that have survived.

19. The dialects of ancient Greece

The Greek dialects of the 1st millennium BC are divided into five major groups: Attic-Ionic, Arcado-Cypriot, Aeolic, Doric, and Northwest Greek. Of these, the most familiar to modern students of Greek is Attic-Ionic, consisting of the closely related dialects of Athens and surrounding Attica, and of the Ionians of Anatolia (East Ionic), of the Cyclades (Central Ionic), and of the region of Euboea (West Ionic). Distinct linguistic features of the Attic-Ionic dialect include the change of **ā* to *ē* (the vowel of *eta*), except after *e*, *i*,and *r* in Attic; and the process of "quantitative metathesis", whereby certain sequences of *long vowel* + *short vowel* become *short vowel* + *long vowel* (e.g. *ēo* gives *eō*).

Of the Greek dialects of the 1st millennium BC, the one most closely related to the language of the Mycenaean Greeks is Arcado-Cypriot. Though far-flung geographically – its speakers ranging from the central Peloponnese to the island of Cyprus in the eastern Mediterranean – the dialect is internally quite homogeneous. Its uniformity is plainly the consequence of common ancestry: Mycenaean peoples who, on the one hand, remained or settled in mountainous Arcadia and who, on the other, came as émigrés to Cyprus with the eclipse of the Mycenaean civilization of Greece. The Greek language of Pamphylia in southern Anatolia shows some similarity to this same dialect group. Arcado-Cypriot is characterized by a peculiar development of early Greek labiovelar consonants when they occur before the vowel *i*. Thus, Proto-Greek **k^{w}is* "anyone" gives Cypriot *sis* (*tis* in other dialects); Arcadian writes the sound with a special symbol (a form of *san*) – Ͷ.

The Aeolic dialect group, like the Ionic, consists of members separated by the Aegean Sea. Lesbian is the dialect of the Aeolian islands and the Aeolian region of Anatolia. Boeotian and Thessalian were spoken in Boeotia and Thessaly respectively; the latter dialect itself is composed of two distinct varieties – Pelasgiotis and Thessaliotis. The Aeolic dialects are characterized by a bilabial development of the labiovelar consonants occurring before *e*-vowels; thus Proto-Greek **penk^{w}e* "five" gives Aeolic *pempe* (cf. Attic *pente*, with the common dental reflex *t*). Within Thessalian, Pelasgiotis and Thessaliotis exhibit two salient differences: (1) the genitive singular of the second declension is *-oi* for the former and *-ō* or *-ou* for the latter; (2) the present infinitive of the *omega*-conjugation is formed with *-emen* in Pelasgiotis, but with *-en* or *-ein* in Thessaliotis.

Doric is that group showing the greatest number of constituent dialects. Distinct varieties from the Peloponnese include Laconian, Messenian, Argolic, Sicyonian, and Corinthian. From the isthmus of Corinth comes Megarian. Greek islands attesting distinct Doric dialects include Crete, Thera, Cos, and Rhodes (with Doric also spoken on the associated Anatolian coast). The various Doric dialects show numerous unique linguistic features as well as features common to both Doric and Northwest Greek, discussed immediately below. Cretan, the best attested of the Doric dialects, shows several specific dialect characteristics, such as a particular propensity for consonant assimilation.

The remaining dialect group, Northwest Greek, is closely related to Doric. Dialects of this type are attested from Phocis, Locris, and Elis. Characteristic of both Northwest Greek and Doric is the preservation of the sequence **ti* (as in Special Mycenaean), without the development to *si* found in other dialects. Elean is interesting in displaying the shift of long *ē* (*eta*) to *ā* – the very reverse of that vowel change distinctive to Attic-Ionic (see above). Also common to Northwest Greek and Doric (Cretan excepted) are the nominative plural articles *toi* (masculine) and *tai* (feminine), rather than the *hoi* and *hai* of other dialects.

Modern scholars have conventionally divided these various dialects into two major groups, East Greek and West Greek, implying some sort of bifurcation in evolutionary descent from Proto-Greek. East Greek subsumes Attic-Ionic, Arcado-Cypriot, Mycenaean, and Aeolic. West Greek is then made up of those two dialects we have already seen to be closely related, Doric and Northwest Greek. The adequacy of this interpretation was, however, called into question by Ernst Risch in 1955 in a careful and probing re-examination of the dialect features that distinguish and bind the regional dialects ("Die Gliederung der griechischen Dialekte in neuer Sicht", reprinted in Kirk, 1964). In summary, Risch argued that the relative antiquity of the various dialect features (isoglosses) must be taken into consideration when determining genetic relationships among the dialects. Those features that place Aeolic within East Greek are relatively late in origin and are characteristic of Lesbian, not Thessalian and Boeotian. Contending that Lesbian acquired these innovating characteristics in conjunction with their development in neighbouring East Ionic, Risch realigned Aeolic, placing it with Doric and Northwest Greek. The resulting dialect structure is then one of South Greek (Attic-Ionic, Arcado-Cypriot, Mycenaean) versus North Greek (Aeolic, Doric, Northwest Greek). The proper genetic grouping of the ancient Greek dialects awaits resolution.

The literary language of pre-Classical and Classical Greek, in its various forms, likewise displays linguistic features that are characteristic of the geographic dialects of the 1st millennium BC. However, the literary dialects are for the most part linguistically artificial. That is to say, they are contrived from elements of different regional dialects and are not themselves identical to any single dialect of spoken Greek – the products of local literary expression that have spread beyond their regional boundaries and have been fused by adapting literary artists. The language of Homer and Greek epic consists chiefly of East Ionic and Aeolic elements, along with bits of Arcado-Cypriot vocabulary. Lyric poetry is composed in several linguistic forms. The Lesbian poets Alcaeus and Sappho write in their Aeolic dialect, but preserve elements of epic language. Archilolochus, Solon, and others write in epic dialect, tempered with their own native Greek dialects. The language of choral lyric is fundamentally Doric, though generally unlike any single regional Doric dialect, mixed with Aeolic and epic. Tragedy's dialect is Attic, with elements of Doric, Aeolic, and epic woven in; choral passages are more heavily Doricized (achieved often by the use of long *ā* where Attic has *eta*). Herodotus and earlier prose authors wrote in Ionic. By the end of the 5th century BC, Attic had become the language of prose, though marked Atticisms (such as *-tt-* where Ionic has *-ss-*) tended to be avoided for a time. With the rise of Athenian political prominence, Attic was the widely used prestige dialect throughout the Greek-speaking world; it remains the dialect of the 4th-century prose authors.

Philip II, a Macedonian, chose to install Attic Greek as the official language of his realm. Greek culture and the Attic dialect trailed in the conquering footsteps of Philip's Greek-educated son, Alexander; Attic Greek thus became the lingua franca of Alexander's vast empire. The particular form which this lingua franca developed is that of a modified Attic, usually called Attic Koine or simply Koine Greek. This is the language of the Greek New Testament and of the Egyptian papyri.

Attic Koine displaced regional dialects within Greece, with the result that almost all modern Greek dialects appear to trace their roots to Attic. The notable exception is the dialect of Tsakonian. In response to Slavic incursions into the Peloponnese in the 6th and 7th centuries AD, the Greeks of Laconia are reported to have fled into the rugged mountains of Tsakonia. The modern dialect that developed in this remote area appears perhaps to be a descendant of Laconian, or at least of some form of Peloponnesian Doric which had resisted the influx of Attic Koine.

Modern Greek dialects have not been as carefully catalogued and analysed as either the ancient Greek dialects or the modern dialects of other European languages. A noticeable dialect difference is one that roughly divides the speech of contemporary Greece into a northern–eastern group and a southern–western group (see Browning, 1983 pp. 120–23 for a detailed description). The former, in contrast to the latter, is characterized by loss of the unaccented high vowels *i* and *u*, and an upward shift of unaccented *e* and *o* to become *i* and *u* respectively. The result is the occurrence of a great many consonant clusters in the northern–eastern group that are not found in the more conservative area.

The spoken vernacular of modern Greece is commonly called demotic. In contrast, there exists the artificial, cultured speech called katharevousa, a self-consciously archaizing official dialect that looks to antiquity for its inspiration and validation. Its use has declined precipitately since the mid 1970s.

Diaspora

From the first period of Greek colonization in the early 8th century BC to the recent emigration movements to the "new worlds" the Greek consciousness has been profoundly marked by the experience of the diaspora. The reality of wandering in faraway places, whether for trade, expedition, settlement, or exile, is coterminous with the dawn of Greek literature and it has permeated both poetry and myth with symbolic representations of alienation, separation, and reunion, as well as with questions of identity, which are linked to the classical theme of the hero's quest. The *Odyssey*, the Argonautic legends, Io's wanderings in the Middle East, the founding of cities on sites identified with the transformation of Nymphs, point to a quasi-metaphysical understanding of the experience of diaspora engraved since time immemorial in the Greek consciousness.

Although the first colonization stories are enveloped in mystery, the wish of the settlers to maintain a more than symbolic link with the *metropolis*, their original mother-city, points to a willingness to see themselves as a people dispersed, as *apoikoi*, from their initial geopolitical centre. In the Hellenistic era their close contacts with the Judaic civilization contributed to a new understanding of the reality of diaspora. This notion of being scattered "abroad upon the face of all the earth" is first developed in the Genesis story of the tower of Babel, where it is linked to the theme of confusion, dispersion, and estrangement from God (Genesis 11: 9). The subsequent Judaic understanding of dispersion emphasizes the experience of exile from Jerusalem as a result of falling captive into the hands of Israel's enemies. However, the dispersed community may reconstitute itself in a *synagoge*, that is a congregation of its scattered members. The institution of the synagogue as a substitute for the Temple worship found its fullest expression among the dispersed Jews in the Hellenic world. It is noteworthy that the dispersed members of Israel formed their synagogues within the communities of the diasporas of the Greeks in the Hellenistic cities of the east.

The Stoics had already prepared the ground for a particular acceptance of a newly worked notion of diaspora by stressing the cosmopolitan nature of the Hellenistic civilization. Just as the Stoic *spermatikos logos* orders rationally the spiritual faculties of men, so the cosmopolis is an image of a rationally ordered natural world composed of a universal commonwealth of men and women dispersed throughout the Graeco-Roman world. The empire is held together spiritually by the operation of the *spermatikos logos*, whose seeds (*spermata*) are scattered throughout the universal dominion, the *oikoumene*. It is to this diaspora of the *Logos*, a metaphysical principle elaborated by Philo Judaeus in Alexandria, that the empire owes its internal cohesion. These doctrines, expressed in an embryonic form by Zeno and later developed by Posidonius, had been influenced to a great degree by the Semitic origins of the founders of the Stoa.

By the 1st century AD the communities of the diaspora, which had been established as *apoikiai*, that is as settlements "away from home", had become autonomous entities within the political administration of the Roman empire. However, the Semitic notion of the diaspora had struck a responsive chord among the Christians, who viewed their existence in this world of the secular kingdom as a temporary exile from their true home, the eternal kingdom of God. It is to these *parepidemois diasporas*, resident aliens in the diaspora of the world, that Peter addresses his First Epistle (1:1).

These assemblies, *ekklesiai*, which had been former synagogues, would now constitute themselves into *paroikiai*, parishes, retaining the diasporic notion of being away from home. Nevertheless, an important element transcended the temporal character of the local assemblies of the Church and constituted them into ecclesial communities: by being called together in one place to partake and be members of the body of Christ they experienced a remarkable sense of unity (1 Corinthians 10:16). Even though strangers and sojourners in the world, Christians formed a local *paroikia* thanks to their unity in Christ; they were already experiencing eschatologically the kingdom of God here on earth. In this spirit the author of the letter to Diognetus (6. 8) mentions the Christians dwelling here on earth "as aliens in the corruptible world, awaiting heavenly incorruptibility". The Eucharistic presence of Christ in the *paroikia* conferred on the community a total (*katholon*, catholic), integral, and internal universality, which had ultimately transcended the limitations of the exilic, diasporic existence. The centre was no longer Jerusalem but the universal, catholic, total experience of life found within Christ in the local assembly, the *ekklesia*, the living body of Christ formed by the individual members of the *paroikia*. If there would be one Jerusalem to return to, this would clearly not be the Jerusalem of this world, "for here have we no continuing city, but we seek one to come" (Hebrews 13: 14).

The Christian Roman empire had provided its citizens with the political frame of a coherent, ecumenical structure based on metaphysical convictions regarding the universal brotherhood of humanity; within that mutual consistency of its members, allowed to come into play by common Orthodox dogmas, the various diasporas had been absorbed by the all-embracing ecumenicity of the empire. This social mode of coexistence of the various ethnic diasporas had certainly been influenced by the message of the Church, which sought to unite all the scattered members of the body of Christ into one body. The Eucharistic experience, which made this union possible, occupied the central place in the ecclesial life of the Christian citizen.

Viewed in this light all former notions of diasporas had become obsolete; the only one still persisting in its old ways was associated with the messianic expectation of the eschatological *synagoge* of the elect people of God, the final assembly at Jerusalem, when the Messiah will abolish the divisive dispersion of his people.

The meaning of diaspora remained inoperative in the Greek world until the Ottoman conquest. As the seat of the Roman empire and the centre of medieval Hellenism fell into the hands of heterodox masters, an increasingly large number of Greeks took the road to exile. Since the seat of the patriarchate, the Great Church, was in unredeemed captivity, a profound hope for the restoration of the empire to its legitimate Romaic and Orthodox masters became widespread and was gradually enshrined in the consciousness of those who had fled to the centres of the Greek diasporas abroad. This profound hope was invested with a messianic vision of an eventual return to the lost imperial and metaphysical centre of modern

Diaspora: news report on a Greek parade in New York

Hellenism. The legend of the last emperor who turned to stone in Hagia Sophia, when the divine liturgy was interrupted as the Turks entered the city, and will be revived at the repossession of the city when the liturgy will be completed, points poignantly to the messianic hopes of the Greeks who had fled the city to seek protection in Christian lands.

The refugees who had settled in Venice, Florence, Padua, Budapest, Vienna, and in other European cities formed the modern communities of the diaspora and appropriated biblical notions of dispersion while nurturing eschatological ideas for an eventual *synaxis* (gathering) in the redeemed centre of their cultural, religious, and political identity. For the Hellenism of the diasporas the heavenly Jerusalem was replaced by Constantinople, which had now become the Polis, the city par excellence, with its Temple, Hagia Sophia, held by the infidels.

This intense longing to return to one's homeland was ever present in Greek literature, in folk songs, traditional tales, and in the popular imagination, constantly fed by the ancient, Odyssean craving for *nostos* (return). However, this primeval desire for *nostos* is now checked by the harsh reality of *xenitia*, life in foreign lands imbued with an unredeemed sense of political impotence. Although the theme of *xenitia*, wandering away from home, had been extensively used by the Church Fathers (the third chapter of St John Climacus' *Ladder* is titled "On Xenitia") to indicate an important spiritual trait in the life of the anchorite, the theological implications of *xenitia*, when elaborated by Church Fathers living under foreign occupation, begin to take on an increasingly secular meaning which is closer to worldly notions of diaspora.

The earliest transfer of meaning from the practice of *xenitia* as a longing for the heavenly home (*en Edem patris*) to a longing for the earthly homeland (*epigeios patris*) comes from a poem of the Cypriot saint Neophytos the Recluse, written in the latter part of the 12th or the early 13th century, when the island was ruled by Guy Lusignan. The wish to be released from the "enemy's bondage" and to regain the "ancient homeland" is expressed in such terms that it becomes ambivalent whether Neophytos is speaking of the dominion of Satan who prevents him from reaching his original home, the garden of Eden, or of the foreign master who has forced so many of his compatriots to experience *xenitia*, to flee from their island in order to live abroad; however, some verses lean towards the political situation that has forced so many Cypriots to live as strangers abroad. In this the poem is similar to other popular works written to lament the unenviable position of the Greeks living in the diasporas of Europe. As in Neophytos's poem, the various *Peri tis xenitias* (On Exile) or *Alfavitos xenitias* (The Alphabet of Exile) poems mainly deal, in a dirge-like manner, with the plight of strangers living in the diaspora: "The stranger is always sorrowful, unceasingly is he crying, the stranger always laments, having no consolation." This theme is increasingly reproduced in folk songs and traditional tales in the 15th and 16th centuries as the Turkish occupation of the Greek world spreads far and wide; nevertheless, it must be noted that it had begun to develop in Cyprus under Frankish, and later on in Crete, under Venetian occupation.

The notions of diaspora and *xenitia* began to loosen their firm hold on the Hellenic consciousness as the Greeks abroad showed signs of recovery from the initial shock of conquest and began to form communities within and through which they would exercise some rudimentary political rights. The Confraternita dei Greci founded in 1498 in Venice, the Greek Company of Sibiu in 1636, of Brasov in 1678, of Vienna, which secured its political rights at the treaty of Karlowitz in 1699, the political presence of the Phanariots in the Danubian principalities beginning in 1709, constitute some examples of a robust mercantile and political presence which, by the middle of the 18th century, had evolved into a full-fledged institution. It must be noted that the above dates mark the maturing point of the Hellenic communities of the diaspora and they should not be interpreted as a terminus a quo of their existence. The Hellenic community of Trieste obtained its official charter from the empress Maria Theresa and built its church and school in 1783, but it was settled by Greeks at least two centuries earlier, since there are accounts of Greeks leaving Pola (Pulj) for Trieste at the arrival in the former city, in 1562, of 180 families fleeing from the Turkish sack of Nauplia. The same remark applies to the Hellenic communities in Venice or

in Pisa, which were in existence at least since the granting of trade privileges to those cities by the Byzantine emperors in the 12th century, and which were invigorated by the arrival of new waves of settlers in the 18th century.

An important line of distinction should be drawn here between the permanent settlements of Greeks outside the borders of the modern Greek nation and recent settlements receiving successive waves of settlers who had fled from their land as a result of foreign occupation. Whereas Paomia, and later Cargese in Corsica were settled in 1676 and 1775 respectively by Maniot Greeks, and may be qualified as centres of diaspora, the same cannot be said of Bulgarian Sozopolis, which was uninterruptedly inhabited by a Greek indigenous population. Neither the ancient cities of Asia Minor nor Constantinople itself could in any sense be portrayed as centres of the diaspora, since they had always been inhabited by Greeks and they were established as cultural and economic cradles of a larger Hellenism, which had survived there since antiquity.

By the beginning of the 19th century, when the Hellenic communities of the diaspora had achieved a satisfactory degree of self-government, the seeds of resistance against the oppressor matured into a full-scale uprising which, appropriately enough, was initially orchestrated from the Danubian principalities. When the descendants of the most prominent Phanariot families, Alexander Mavrokordatos and Dimitrios Ypsilantis, joined the war of liberation in Greece, their ambitions were motivated by the long-held aspiration of restoring the centre of Hellenism, Constantinople, to its rightful owners, the Greeks who had been dispersed in the diasporas of the world. When it became obvious that modern Hellenism was to be restricted within the small enclave of the Greek mainland, leaving the Hellenism of the periphery outside its borders, the Greeks of the centres of the diaspora began to pour into the liberated segment of Greece, thus precipitating the end of the age of the diaspora.

The wave of immigration to the Americas, Australia, and parts of Africa also had its great periods, especially as an aftermath of major national disasters such as the massive exodus of Greeks from Asia Minor in 1922, but it was totally deprived of the metaphysical or messianic motives that had conferred of old on the theme of the diaspora its mythopoeic qualities.

Digenis Akritis

Hero of a Byzantine romance

Digenis Akritis is the hero of an epic-romance of Byzantine date and of ballads in 15-syllable verse collected in the 19th and 20th centuries. According to the romance, an Arab emir abducted, then married, the daughter of a Roman (i.e. Byzantine) general in the frontier area between Cappadocia and Syria. Their son Digenis ("of two races") proved a youthful prodigy in skirmishes with bandits (*apelatai*) and in hunting wild beasts. He too abducted a bride, another general's daughter, and defended her honour against bandits (including the female warrior Maximou) and supernatural beings. He imposed law and order in the region, acquiring the name Akritis ("frontiersman"). He then settled down with his wife on the banks of the Euphrates, to pass the rest of their lives in peaceful isolation in the magnificent castle he had constructed. This was not to be: Digenis succumbed to a fatal illness and, unable to bear the grief, his wife expired with him. Mourners came from far and wide to honour the youthful couple and to inter them in a conspicuous tomb.

This romantic story, which has epic overtones in its battle scenes, survives in six manuscripts dating from the early 13th century to 1672. All follow a similar plot but with considerable variation in wording. The two primary versions are those in manuscripts now kept in the Grottaferrata monastery near Rome (G, 13th century) and in the Escorial Library near Madrid (E, late 15th century). G's text, divided into 8 books, is written in an at times poorly controlled form of the Byzantine Koine. However, the narrative is reasonably well organized and coherent. E, an undivided yet episodic narrative, is less convincing as regards its plot, and its more popular language is seriously disturbed in the manuscript. There is much dispute over the relationship between these two versions: did G change into E or was a text like E rewritten to form a text like G? Recent work suggests that neither case is likely. Both versions probably draw loosely on a common original poem, the outline of whose plot can be perceived from close similarities between G and E but the details of which cannot now be reconstructed. The remaining four manuscripts represent versions of an early 16th-century compilation, made possibly in Venice for a printing which was never executed. The compilation was made on the basis of a text like G and the actual manuscript E.

The original poem that lies behind G and E had probably been composed in the mid-12th century, during the literary renaissance at that period when experiments were made with the literary use of vernacular Greek and there was a revival of interest in the novels of the ancient world. Reflections of the ancient novels and their Komnenian counterparts can be seen in *Digenis Akritis*, especially in G. There are also many historical allusions which hark back to the Byzantine–Arab wars of the 9th and 10th centuries, loosely reflecting the administrative structures of that period. It is very likely that the 12th-century poem was written in Constantinople, its narrative constructed from lays or ballads that had been circulating for many years in Anatolia, some concerned with the now legendary members of the Doukas family.

No doubt there were Byzantine folk songs on Digenis, but no direct signs of their existence are known before the mid-17th century. More surviving examples were collected in Pontus from around 1870 onwards, at about the time of the first rediscovery of a manuscript of the Byzantine romance in the Soumela monastery of Trebizond. The subjects include the abduction of Digenis' bride, the building of a castle, and his encounters with strange beasts. Variants on one of the most dramatic ballads, on Digenis' struggle with Charon, have been recorded throughout Anatolia and the Greek islands. It has been suggested that the ballads are the remains of the lays out of which *Digenis Akritis* was constructed, but it is more probable that the similarities are due to a common pool of traditional folk material. They continue to be sung to this day.

A number of ceramic plates, some, it seems, of 12th-century date, have been found in places such as Constantinople, Corinth, Athens, and Sparta, depicting scenes that arguably represent episodes from the epic or the ballads: these include a soldier in a pleated kilt (Digenis' traditional garment), a dragon pierced with darts, and a female warrior (Maximou?).

When the manuscripts of *Digenis Akritis* were brought to light at the end of the 19th century, this poem was hailed as Greece's medieval equivalent to Homer and to the European *Beowulf* and *Chanson de Roland;* its hero was claimed as a powerful national symbol, despite his explicitly mixed ancestry. Literary resonances from the epic can be found in the work of 20th-century writers, especially that of Kostis Palamas.

ELIZABETH M. JEFFREYS

See also Poetry (Epic, Antiquity)

Biography

Digenis Akritis is the mythical hero of an eponymous Byzantine epic-romance, compiled perhaps in the 12th century. Six manuscripts of the poem survive, of which two are early but display considerable variation. Episodes from the life of Digenis also feature in folk song and as illustrations on early ceramic plates. When the MSS first appeared (late 19th century) the poem was hailed as a medieval equivalent to the work of Homer.

Dimaras, K.T. 1904–1992

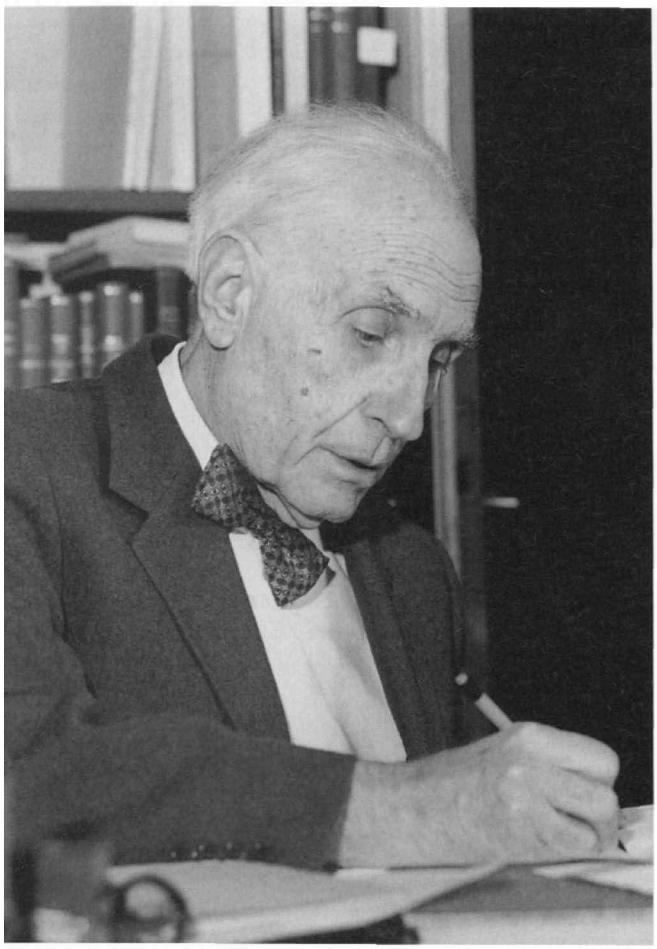
Historian of ideas

Konstantinos Thiseos Dimaras was one of the most important Greek thinkers of the 20th century. He was one of the leading representatives of the "1930s generation" and befriended many of them, including George Theotokas and George Seferis. He was one of the founders of comparative literature in Greece, focusing his research mainly on the "history of ideas". Although his whole work emits a universal and transcendental feeling of Hellenism from antiquity to the present, he is considered to be the first, as well as the most important, scholar of the Modern Greek Enlightenment. Besides, it is he who established this term.

As he himself effectively put it, both his parents' families "were merchants, and for this reason they loved education". He had his father's and maternal grandfather's large libraries at his disposal. He grew up in a loving, scholarly environment: Nikolaos Dimaras, law professor, was his father's brother, while Constantine Raktivan, a great jurist, was his mother's brother. Prominent personages of the time frequented his house, including the Delta family, Dimitrios Balanos, and the linguist Manolis Triantaphyllidis, a distant relative who introduced the young Dimaras into the conflict over the predominance of demotic Greek. After that, Dimaras maintained a stable and, at the same time, critical relationship with the demotic Greek movement. He attended the Makris school where his contact with the strong personality of Ioannis Apostolakis was crucial, since it was to this scholar that he owed his introduction to "idealism". In 1926 Delmouzos and Apostolakis invited him to contribute to *Ellinika Grammata* (Greek Literature), which was edited by Kostis Bastias.

The philosophical quest of his youth was very strong, hence his registration at the Faculty of Philosophy of the University of Athens in 1921, where he was significantly influenced by Theophilos Voreas. He concluded that he had to study the sciences in order to "philosophize". As a result he studied physics and mathematics for four years and subsequently registered as a student at the medical school. This period left its mark on him, as it equipped him with many of the methodological tools that he would later use in his historical and philological research. He returned to the Faculty of Philosophy in 1925, where Constantine Amantos steered him towards the history of literature.

In retrospect, Dimaras later revealed his first serious readings: "I read incessantly ... I read many of the ancient authors ... the Presocratics, as well as Philostratus, Diogenes Laertius, and minor authors of ancient Greek literature." As for modern literary production, he was fascinated by Adamantios Korais and Kostis Palamas. Dimaras was a genuine representative of the "1930s Generation"; he retained close and fertile contact with European, particularly French, culture. He was attracted by the religious philosophy of Abbé Brémont; he read Maritain, and René Guénon, with whom he also corresponded. He studied the New Testament, Plato, Aristotle, Spinoza, Pascal. He included in his lectures authors who were ideologically conservative, like Charles Maurras, Léon Daudet, and the circle of Action Française. He described André Gide as "a great master of virtue" through his *Nourritures Terrestres*,



K.T. Dimaras, historian of ideas

and when Gide visited Greece, he met him in person. He also mentions Julien Benda. He was considerably influenced by Albert Thibaudet as well; it was from him that Dimaras adopted the use of the term "generation", which seriously preoccupied him, and which he consistently elaborated in his work.

A freelance period started in 1926. Dimaras contributed articles to several philological periodicals of the time, *Ellinika Grammata* (Greek Literature), *O Kyklos* (The Circle), *Eos* (Dawn), *Idea, Nea Estia* (New Hearth), etc., sometimes under an alias like "KONST(antinidis)", "Philonous", "P. Raphael". He later contributed articles to *Philologiki Protochronia, Aggloelliniki Epitheorisi, L' Hellénisme Contemporain, Epoches*, etc. He also contributed entries to the *Megali Elliniki Egkyklopaideia*. These articles were followed by his "Opinions" in the daily press, *Proia*, and *Politeia*. As of 1936, an important stage in his career began with his regular, weekly collaboration with the *Eleutheron Vima* (the later *Vima*), in which he wrote the column "The World of Culture". However, he did not confine himself to literary criticism and book reviews for long. His opinions "gradually turned from literary criticism towards the history of literature and ... methodology". There are more than 2000 of these articles which date from 1936 to 1987, when he stopped his collaboration with *Vima*, and cumulatively they function as a "national inventory", in sympathy with Dimaras's aims. At times, they carried programmatic aims, as in the case of his opinions of June–August 1942, particularly the one entitled "Means and Ends". In this article Dimaras outlined "a programme for the study of Modern Greek literature, particularly during the period of the Turkish Occupation". Through the number and variety of these publications one can discern what the critic Alexandros Argyriou justly called "a free thinker". In his publications Dimaras expressed his philosophical and aesthetic tendencies, his "eusebism", which, during his mature period evolved into "adiaphorism", his curiosity, as well as his gradual passage through the various stages of the Greek literary tradition from antiquity to the Middle Ages and the modern period. His first two treatises, that were forgotten for many years, presented a particular interest: *Treatise on the Physical Theology of the 5th-century* BC *Sophists* (1926), which stemmed from a course of Theophilos Voreas. It dealt with the much-discussed subject of the Sophists' atheism. In his 1927 treatise entitled *Parmenidis: Introduction to the Philosophy of Parmenidis and Translation of his On Truth* Dimaras advocated the idea of the separation of philosophy from science.

In 1933 he published in *Nea Estia* a short comment entitled "Memorial for Korais", thus inaugurating a long period of study of the man and his work, which resulted, among other things, in the definitive edition of the voluminous correspondence of Adamantios Korais in six volumes (Athens, "Group for the Study of Greek Enlightenment", 1964–84).

Dimaras expressed his interest in poetry very early. In 1932 he published his study "Some Sources of the Art of Cavafy" in the journal *O Kyklos*, while in 1934 he published an anonymous review of the first collection of George Seferis entitled *Strophi* (Turn) in the journal *Vivlia* (Books). The following year he published the important theoretical treatise "Seven Chapters on Poetry" in the journal *Nea Grammata*. Among his later contributions, were his monograph *Kostis Palamas: Hi poreia tou pros tin techni* [Kostis Palamas: His Road to Art] (1947), and the translation of Constantine Cavafy's poems into French, in collaboration with Marguerite Yourcenar in 1958 (2nd edition 1978).

However, his detachment from aesthetic evaluations, as well the influence that his thinking received from the methods of comparative literary history, took place around 1940. The influence of Kostis Palamas, and the intellectual debate of the "1930s Generation" also contributed to this development. Dimaras believed that modern Greek studies "belonged to a large context which not only involved chronological antiquity, but also involved the geographical west". The great compositions of Daniel Mornet, Paul Van Tieghem, Paul Hazard, etc., expanding the field of research, relationships, and coincidence (*coincidences, simultanéités*), fitted his psyche, and he consequently adhered to the emerging "history of ideas". Dimaras followed the so-called French School, which was based on the literary history of Gustave Lanson. He did not adhere to the various innovative trends which flourished from the 1950s on. By totally emphasizing the "empirical" character of phenomena, the tracking of "multiple causes", and the practice of "successive approaches", and by declaring the absolute supremacy of historical continuity, he believed that literature or history (including historiography) can only be comparative. He based this theory on the fact that "one cannot isolate a

cultural phenomenon in one area, and cannot avoid continuously correlating different cultures". By using comparativism as a tool, a science of convergence, as well as "a science of differences", one is able to penetrate the specificity of Hellenism.

From the end of the 1930s it is possible to discern an evolutionary course and, most importantly, duration in Dimaras's work. Comparativism was present in its various aspects as the study of literary movements and genres; as the stamp of the "prerequisites" for their entrance into Greek cultural life; as a tracking of "sources" and "influences" (*Romantika Simeiomata* [Notes on Romanticism], 4 vols., 1944–46, *Phrontismata 1: Apo tin Anagenisi ston Diaphotismo* [Phrontismata, Part One: From Renaissance to Enlightenment], 1963 etc.); as an interpretative approach to "social" and "cultural" groups; and as the crystallization of new ideas and concepts. Dimaras's trajectory can be summarized as follows: from the "history of ideas" he moved to the "history of culture" (from the period of the German occupation on), and then to the "history of conscience".

During the period of the German occupation Dimaras gave a series of ten courses that formed the first kernel for his history of literature. He was encouraged by Konstantinos Amantos, the lectures of 1946 at "Athenaeum" followed, and, last but not least, he received a commission to write a history of literature from Ikaros Publishers. Dimaras's most important work, the *Historia tis neoellinikis logotechnias* [History of Modern Greek Literature], was published in 1948 and 1949 in two volumes. It was reprinted many times (eight to date), as well as translated into other languages (French, Romanian, Bulgarian, and English). It constitutes a fundamental tool which respects the totality of Hellenism and "attempts to define the term Modern Greek". By juxtaposing it to the term "post-Byzantine", which survived in various sectors, including art and law, Dimaras traced the formation of a "pre-Modern Greek" element in the Byzantine civilization, already present in the 13th century BC. This work is a synthesis that also identifies multiple causes while attempting to define the "character" of Hellenism within the greater geographic area of southeast Europe, where it developed. Its history is not based on extraordinary cases, on the aesthetic evaluation of a certain number of masterpieces. In the succession of phenomena, average works, minor thinkers, translations, the non-literary, scientific discourse occupy an important interpretative position, next to the "peaks".

In his later years Dimaras concentrated more on aspects of lexicography and ideology, as is obvious from the important Introduction to the reprint of the *Synagogi Neon Lexeon* [Collection of New Words] by Stephanos Koumanoudis (1980). He also dealt with aspects of the historiography of modern Hellenism, a subject which he treated in his studies, several of which were included in the volume *Ellinikos Romantismos* [Greek Romanticism] (1982). He was occupied by the individual factor in history, the relationship of the individual to collective bodies in great national or international affairs. He oriented himself to a renewed view of biography, as is evident in his important study entitled *Constantine Paparigopoulos: His Time, His Life, His Work* (1986), as well as his study of educational institutions and his treatise on the founding of the University of Athens entitled *Athens, 3 May 1837: A Historical and Philological Study.*

Dimaras has been recognized as the scholar of the Modern Greek Enlightenment par excellence. He already made use of the term in his 1945 article entitled "The French Revolution and Greek Enlightenment" in the journal *Dimokratika Chronika* (Democratic Chronicles). In a multitude of articles and studies, in which the work of Dimitrios Katartzis was discovered and made known, and which culminated in the publication of *Euriskomena* (Extant Opus; 1970), Dimaras dealt with all aspects of the phenomenon. In 1965 he published a small volume entitled *Symposiaka (Symptoseis–glossa–genees)* [Symposiaka (Coincidence–Language–Generations)], while in 1969 he published a small, though essential, compilation of studies in French which was entitled *La Grèce au temps de Lumières* (Geneva, Droz). In 1977 he published his compilation entitled *Neoellinikos Diaphotismos* (Modern Greek Enlightenment), which was reprinted many times. In his introduction he mentions several key concepts that are crucial in his work: the quest for "collective or national characterology"; the prosopographical and psychographical interest that preoccupied him after his youth; a need to "measure"; and the "statistical conscience" which is indispensable to the history of ideas, mentalities, and of conscience.

Dimaras was a scholar who was dedicated to his work, although he also happily contributed to public affairs, in his own way, by creating and establishing important and, in their time, pioneering institutions. In 1951 George Papandreou, then Minister of Education, asked him to organize and direct the Foundation for State Scholarships. Already in an opinion dated 1946 Dimaras had underlined the need for such an institution. In 1959, aided by Leonidas Zervas and Ioannis Pesmazoglou, he contributed to the founding of the Royal Foundation for Research, currently the National Hellenic Research Foundation (NHRF). He became the first Directing Adviser and Director of the Centre for Neohellenic Research (CNR) which was founded in December 1960. In the CNR, which was his spiritual child, he laid the foundations for his research strategy through the compilation of seminal works for the "national census" of later Hellenism. He held this position until 1970, when he was removed from it by the April dictatorship. In 1961 he founded, together with Dimitrios Ginis and a group of scholars, the "Group for the Study of Greek Enlightenment", which was one of the earliest of such societies in Europe. He also laid the foundations for the series "Nea Ellinika Keimena" (Modern Greek Texts), and for the journal of this group entitled *O Eranistis*. After his removal from the NHRF, he was invited to assume the direction of Neohellenic Institute of the Sorbonne, where he also occupied the chair of Modern Greek Literature. He retired from that position in 1978. After that he did not hold any office and dedicated himself to writing. Although Dimaras reluctantly accepted his professorial position, he acquired, directly and indirectly, many disciples. Through his methodology, as well as his long career in Greek letters, he exercised a considerable influence on his contemporaries, as well as on the following generations.

Biography

Born in Athens in 1904 to a family of merchants, Dimaras studied physics, mathematics, and philosophy as well as the history of literature at the University of Athens. He became a leading representative of the "1930s generation", contributing to various periodicals and newspapers. His *History of Modern Greek Literature* appeared in two volumes in 1948–49. He was Director of the Centre for Neohellenic Research in Athens from 1960 to 1970 before becoming professor of Modern Greek Literature at the Sorbonne, 1970–78. He died in Paris in 1992.

Dio Cocceianus *c.*AD 40–112

Orator and philosopher

The life and career of Dio Cocceianus not only form the background to his literary work, but also provide valuable insights into the situation of the Greeks under Roman rule during the so-called "high" empire (1st and 2nd centuries AD). Born into an influential family in Prusa in the province of Bithynia (northeastern Asia Minor), Dio first attained a prominent position as a well-educated Greek intellectual in Rome under the Flavian emperors. When, however, he (apparently) became implicated in the disgrace of a prominent Roman, Flavius Sabinus, under Domitian, he was banned from Rome and his home province; suddenly destitute, he took up the life of a wandering philosopher with Cynic affinities, roaming as far as the very outposts of Greek culture on the northern shore of the Black Sea. With the accession of the emperor Nerva (and his adoptive son Trajan) in AD 96, Dio was able to return to Prusa, where he regained his family's leading position and apparently played a major (though not uncontroversial) role in local and provincial politics until his death. Most of Dio's so-called *Bithynian Speeches* were written during this time and give valuable insights into the numerous rivalries not only within Greek provincial cities but also among them, and into their relations with Roman authorities.

Dio did not confine his public appearances to his home province, but also exhorted a number of other cities in Asia Minor (and even Alexandria in Egypt) to remain true to their former ideals and to keep the peace with each other and within themselves. He also addressed four speeches *On Kingship* to the emperor Trajan, with whom he developed a relationship marked by mutual respect and friendship. Apart from such speechmaking, Dio's oeuvre comprises an astonishing variety of themes and literary forms: essays on moral themes (*On Servitude*, *On Liberty*, *On Fate*, *On Philosophy*, etc.); lively dialogues that often feature the colourful figure of Diogenes the Cynic; treatises on literary subjects (e.g. a comparative study of the three Philoctetes plays written by the great Classical tragedians); a guide to suitable literary models for rhetorical imitation; and even writings on art (the *Olympic Discourse* is centred on Phidias' magnificent statue of *Zeus* at Olympia and the religious awe it conveyed). An especially entertaining part of this production consisted in so-called "sophistic" display rhetoric and treatments of paradoxical themes (the *Praise of the Parrot* is lost, and of the *Praise of Hair* some excerpts were incorporated by Synesius in his *Praise of Baldness*); an impressive tour de force is the *Trojan Discourse To Show that Troy Was Not Captured*, directed against the monumental work of Homer himself (but not really meant seriously, because Dio in many other essays quite happily accepts Homer as a model and teacher). Not all of this enormous production (the transmitted corpus contains 80 items, including two false attributions; but a number of works have been lost, some of which are still cited by their title in the late 10th-century *Suda* lexicon) can be securely dated. A number of works certainly go back to the time before Dio's exile, but the greater part was probably written afterwards (in exile he collected material for a now lost *Getica*, a historical description of this Scythian people).

The wide range of Dio's literary work prompted a lively debate about his exact position within the cultural currents of his times: was he to be reckoned more as a philosopher or as a rhetorician? This debate started soon after his death, and its long duration was one of the marks of his continuing influence: the philosopher Epictetus judged Dio to be only a rhetorician, more intent on form than on content, but Dio's pupil Favorinus regarded him – more positively – as a guiding moral authority even after his death, even seeing him in dreams. Lucian – in *De Morte Peregrini* – placed him beside the philosophers Musonius and Epictetus himself, both of whom suffered exile for their persuasions. In the 3rd century AD the "historian of sophists" Philostratus gave two pictures of Dio not wholly consistent with each other: in his *Life of Apollonius*

he made Dio participate in a momentous (but fictional) "Constitutional Debate" with Euphrates of Tyre and Apollonius of Tyana, in the presence of the future emperor Vespasian; in the *Lives of the Sophists* he characterized him as a philosopher-sophist, whose philosophical disposition was clothed in the rhetorical abilities of a Sophist. In the latter part of the 4th century the philosopher-rhetor Themistius mentions Dio within a series of philosopher-advisers of Roman emperors; in the *Lives of the Philosophers and Sophists* of Eunapius, he is similarly ranked as a philosopher. A few years later, a more discriminating and in later times very influential picture of Dio was outlined by the Neoplatonist (and later bishop) Synesius of Cyrene: according to him, Dio set out as a clear-cut sophist, who even wrote strident tracts against philosophy, and only turned philosopher during and after his exile, so that his writings should be carefully divided into pre- and post-exile productions.

The other enduring aspect of Dio's influence was the style and content of his various works which provided stimulants and stylistic models until the end of Byzantium. Already in Lucian's writings many features of Dio's work reappear. In the 3rd century AD Menander of Laodicea (who was the first to record Dio's later canonical name "Chrysostomus") cites Dio as an example of an easy-running and graceful style, and as such he continues to be read. Our first witness for the importance of Dio in Byzantine times is – as so often – Photios, who in a detailed account in his *Bibliotheca* (Codex 209) not only discusses Dio's life and style of writing but also gives an item-by-item outline of the corpus of his works as it was extant in his day (this, incidentally, is identical with what is still preserved). Soon after, Arethas of Caesarea (though he strangely misplaced Dio by making him a contemporary of Nero and Vespasian and even more strangely explained his surname "Chrysostomus" as a euphemism for "stinking-mouth") not only ensured the ongoing transmission of Dio's works, but also added numerous and rich explanatory notes to the manuscript that was produced on his initiative. Arethas especially commented on those writings of Dio that were to be at the centre of the Byzantines' interests for centuries to come: the speeches *On Kingship*, the *Euboean Discourse* (a charming picture of the simple rural life on Euboea combined with moral advice for the urban poor), the *Borysthenitic Discourse* (a vivid description of Dio's visit to Olbia on the Black Sea and the cosmological myth he told there), and the *Trojan Discourse*. In the 11th century John Mavropous wrote a speech for the emperor Constantine IX that drew on Dio's *Borysthenitic* and kingship speeches; the latter also provided a model for the address to Constantine X written by Theophylact, archbishop of Ochrid. In the 12th century Dio's *Troicus* aroused the ire of John Tzetzes, who severely condemned every attempt *not* to take Homer's *Iliad* allegorically. Even Eustathios, the indefatigable commentator on the Homeric poems, seems to have taken Dio's anti-Homeric tour de force seriously. The last major witness to the Byzantines' unflagging interest in Dio is the essay on him by Theodore Metochites (1270–1332), wherein he subtly compares him to Synesius, Dio's most prominent admirer in late antiquity, and stresses the artfulness of his seemingly simple style. Because, however, even this simplicity moved within the confines of a long since obsolete literary language (the Attic of the 4th century BC), Dio's literary influence ended with the Byzantine empire.

HEINZ-GÜNTHER NESSELRATH

Biography

Born *c.*AD 40 at Prusa, Dio moved to Rome as a rhetorician, but was banished for political intrigue and spent many years wandering about the Greek-speaking world. In 96 he was able to return to Prusa where he played a part in local politics until his death *c.*112. His surviving works, a total of 78, include speeches, essays, and dialogues on philosophical as well as rhetorical topics.

Diocese

Unit of administration

The term diocese refers to various administrative units, all of which suggest divisions or subdivisions for the purposes of organized management. The use of the term for administrative units is Hellenistic in origin. It had a profound conceptual influence on forms of imperial and ecclesiastical administration, even as the term itself took on various meanings in different contexts. The early uses of the term refer to the responsibilities of treasury officials; later it was used to refer to different types of territorial divisions within Roman and Byzantine imperial and/or ecclesiastical structures. Through a process of

linguistic generalization, the term also came to be used for an ordering by Christ, the angels, the Church, etc. The history of the term begins in the Hellenistic period with reference to the *dioiketes*, a Ptolemaic official responsible for the financial and interior matters of the king (see Bagnall, 1976). Early in the Roman empire the term was used synonymously with *conventus*, a provincial subdivision that defined a community for the purposes of administration. The sense of diocese as *conventus* would persist in some areas of the Roman empire into the 4th century AD and perhaps beyond, even after Diocletian divided the empire into 12 dioceses for centralized administration in the late 3rd century AD. Diocese also became a territorial unit of ecclesiastical administration, in which capacity it persisted, in concept, in the Byzantine Church into the 12th century. The more recent division of church diocese is related to these earlier divisions, but only in the sense of the organized territorial division of a larger entity, not literally in terms of the geographic areas of these older divisions.

The first territorial use of the term diocese, apart from the implications for financial administration suggested by the Ptolemaic *dioiketes*, occurs in Greek writings describing the Roman administration system of *conventus*. Strabo, for example, describes dioceses as units of territorial and legal division in the same areas that other authors describe as *conventus* (*Geography*, 3. 4. 19–20). The *conventus* as a subdivision of a province is attested most notably in Spain, Dalmatia, Asia, Cilicia, and Sicily. The *conventus* functioned as an administrative unit for taking assizes and later formed literal divisions of provinces in some areas for the purposes of legal administration and as a subdivision of the imperial cult. Some scholars have argued that the *conventus* system itself was borrowed from a Pergamene institution, although this explanation has been challenged convincingly (see Burton, 1975). In most areas, *conventus* divisions appear to have been obviated early in the empire as older provinces were subdivided into newer, smaller provinces; but in some areas, such as Spain, they persisted. Cicero describes as dioceses the divisions known by Pliny the Elder and others as *conventus*, thus further suggesting that the term diocese was the Greek term for the Latin *conventus* (see Albertini, 1923). It was the Greek term rather than the Latin that would be more prominent in the later administrative structures of the empire and, with it, the Church.

With Diocletian's restructuring of the empire in the late 3rd century AD the term diocese was used to refer to the larger supraprovincial divisions of the empire presided over by a *vicar*. The Verona List (*c.*AD 297) records 12 such dioceses: Africa, Asia, Britain, Gaul, Italy, Moesia, Oriens, Pannonia, Pontus, Seven Provinces, Spain, and Thrace. Some of these were subdivided later – Italy was divided in two with capitals at Rome and Milan; Moesia became Dacia and Macedonia; Oriens became Egypt and Oriens. According to some historians, the division of provinces sounded the death knell for the few remaining *conventus* dioceses remaining in the empire, since their usefulness was challenged by the smaller administrative units. Some *conventus* divisions continue to appear in the sources, however, such as the 5th-century *Chronicle* of Hydatius and the Council of Toledo (*c.*400). Nevertheless, Diocletian's division did incorporate the lines of some of the earlier *conventus* dioceses in the few areas they are still attested. Diocletian's diocesan system stopped working effectively during the 5th century (Jones, 1964, p.374). More than one emperor during this century and after deemphasized the role of the vicar and diocese in the administration of the empire. References to the diocesan system disappear during the 7th century.

Ecclesiastical dioceses followed the lines set out by Diocletian's redivision. Church councils and other writings of the 4th century (First Council of Constantinople, John Chrysostom, Socrates) refer specifically to most of the Diocletianic dioceses as basic units of church administration. The bishops of dioceses became known as exarchs and/or patriarchs. Ecclesiastical dioceses were subsequently divided into episcopal provinces, known as *eparchiai* and *paroikia*. The *eparchia* was associated with the metropolitan bishop, and the *paroikia* with those in surrounding areas. In its capacity as a unit of Church organization in the East modelled loosely on the provincial organization, the term diocese persisted into the 12th century, when it appears in the writings of canonists. Some canonists suggest that the term had undergone changes in exact administrative usage since the 4th century. Balsamon (*Patrum Graecorum*, 137. 420) specifically suggests that the privileges and powers of metropolitans vis-à-vis exarchs had changed somewhat in favour of the metropolitans, who appear to be no longer under the authority of exarchs. After the 12th century the term diocese in this sense no longer appears in reference to Church administration. The hierarchy of patriarch / metropolitan / bishop, however, became permanently written into the Byzantine Church, and has affected subsequent Church organizations.

As a Greek term and inspired by Hellenic and Hellenistic adminstrative structures and concepts, the diocese had an important influence. Administrative structures in the Roman and Byzantine empires as well as in the ecclesiastical administration of the Byzantine Church and its progenies were shaped, if only by homology, by the diocesan concept of administration and organization.

Diodorus Siculus

Historian of the 1st century BC

One seldom encounters a figure so wrapped in the Greek tradition as Diodorus Siculus. Neglected by his contemporaries and often discounted by modern scholars, his work preserves priceless portions of Greek history and historiography. His *Library of History* claims to trace the history of the entire world from creation up to Diodorus' own days, formally ending with Caesar's consulate in 60 BC. Of Diodorus himself we know little, except for what we can glean from this work, which he claims was 30 years in the making. He was a native of Agyrium in Sicily, visited Egypt around 60–56 BC, and had some familiarity with Latin and Rome. The last event he mentions seems to be from 36 BC. Apart from ethnographic excursions in the early books, Diodorus' focus is almost entirely on Greece, Rome, and Sicily. Of the *Library*'s 40 books only 15 survive intact (1–5, 11–20), as well as substantial fragments from the remaining 25. These remains form the largest corpus of Greek history to survive from antiquity to our own day.

Diodorus' *Library* provides an intriguing glimpse into many varieties of Greek historical writings that would otherwise be largely unknown to us. The *Library* incorporates – relatively faithfully and relatively uncritically – a vast amount of otherwise lost literature in abridged form. After a brief account of the creation of the world, he gives an ethnography of Egypt, mostly from Hecataeus of Abdera; a legendary history of Mesopotamia, from Ctesias; and an account of India from Megasthenes. He then gives copious summaries of myths, canonical and deliberately outrageous, relying on Dionysius Scytobrachion and several others. In subsequent books he preserves tales about the Seven Sages, legendary lawgivers, and Themistocles, giving us a window into Greek traditions. His version of the Peloponnesian War and its origins, based on Ephorus and possibly Philistus, provides an interesting contrast to Thucydides. Diodorus provides our only continuous narrative of the history of 4th-century BC Greece, including book 16, which is devoted entirely to Philip II of Macedon. Book 17 is the earliest continuous surviving narrative of the campaigns of Philip's son Alexander, an account possibly adapted from Cleitarchus. Books 18–20, based on the work of Hieronymus of Cardia, are our best source for the wars of Alexander's successors. In addition to all of this material, Diodorus often shifts the scene and discusses contemporary developments in his native Sicily, using the histories of such fellow Sicilians as Timaeus and Philinus. It has been aptly said that a history of that island would be impossible without Diodorus. Later fragments, including a large narrative of the Sicilian Slave War of *c.*136–132 BC, may ultimately derive from the work of Posidonius. In addition to many historical works, mythographies, and ethnographies, Diodorus summarizes at least one novel, *The Islands of the Sun* by Iambulus.

Diodorus' intent was to produce an all-encompassing, chronologically accurate, handy compendium of world history. He was neither a deep historical thinker nor an adept prose stylist. He avoids elevated language and overtly strives for a monotonous consistency in style. These considerations – combined with the patently derivative nature of his work – kept him from gaining acclaim or respect among his Augustan contemporaries. He is first mentioned in a backhanded compliment from Pliny, who notes that the *Library* of Diodorus, unlike most second-hand anthologies, has an honest title. However, generations of Greeks found his compendium so useful that it was preserved, while almost all other Hellenistic prose literature – stylistically out of fashion – was consigned to oblivion. Aelian was apparently familiar with him and Athenaeus cites him. He receives copious praise and use from chronographers and writers from Eusebius in the 4th century AD to John Tzetzes in the 12th. These writers valued utilitarian history over good style or subtle theories of causation. Chronographers clearly also appreciated Diodorus' original integration of Roman and Greek chronology: even today he remains our earliest and most important source for the Roman *Fasti Consulares*. Diodorus was not always successful at synchronizing the Roman calendar with the Athenian one, and his work suffers from the embarrassing lapses one would expect from such a vast, self-published encyclopaedia. In the *Library* events are rigidly divided annalistically by archon and consular years, often interrupting the narrative and resulting in doublets and confusion.

In the Byzantine empire Diodorus' vision of a historical reference book seems to have found kindred spirits. Diodorus was summarized by Photios (Codex 70) whose praise is particularly effusive, complimenting his clear and unaffecred style as well as his historical acumen. Another index of Diodorus' later popularity is the note in the *Suda* that Diodorus lived past the reign of Augustus, which possibly indicates a posthumous continuation of his work. Large fragments of lost books of Diodorus are preserved in the excerpts compiled under the direction of the emperor Constantine VII Porphyrogennetos (913–59), divided into convenient sections ostensibly for the purpose of ready reference by statesmen and scholars. The rediscovery of Diodorus in the west was also greeted with enthusiasm by a Renaissance reading public eager to learn more of the Greek past. This enthusiasm became muted in the following three centuries as Diodorus' intellectual poverty, his often compressed and muddled narrative, and frequently faulty chronology became more apparent.

Increasingly scholars are exploring the complex relationship between Diodorus' text and his sources. Even where it can be shown that Diodorus is rewriting earlier narratives, simply abridging and changing the style, he also adds his own interpretations and emphases. These interpretations, as well as the grand design of the work, provide an interesting picture of one Greek's view of history from a small town in Sicily during the Augustan era.

KENNETH MAYER

Biography

Born at Argyrium in Sicily, Diodorus "the Sicilian" wrote a world history from the creation down to his own time, ending in 60 BC. He visited Egypt *c.*60–56 BC after which he may have settled in Rome, completing his history *c.*30 BC. Of its 40 books only 15 survive intact, plus fragments of the rest. Despite many inaccuracies his work remains of value.

Diogenes Laertius

Biographer of the 2nd or 3rd century AD

Diogenes Laertius is the author of an extant compendium on the lives and doctrines of ancient philosophers that comprises ten books. In addition to this work, he wrote epigrams and he implies (1. 39) that he published a separate collection of them entitled *Pammetros* (Poems in Various Metres) in at least two books. Some of these epigrams on various philosophers are quoted in his historical work. Nothing is known about the author himself and the few references to himself in his work do not reveal much. There is no secure dating either of him or his work. The usual practice is to date him on the basis of the philosophers that he mentions (and does not mention). The latest figures that Diogenes refers to are Sextus Empiricus and Saturninus, both of them Pyrrhonian sceptics usually dated in the late 2nd century AD, while he does not mention any Neopythagorean or Neoplatonist philosopher. He probably lived in the late 2nd or early 3rd century AD. We know nothing of Diogenes' education, where and with whom he studied philosophy for instance, and his philosophical allegiance is a matter of speculation. Neither do we know anything about the composition of his work except that it was apparently dedicated to a lady who had an interest in Plato (3. 47).

Diogenes begins with a general introduction in which he deals with some elementary questions such as the rise of philosophy, the spread of philosophy among the Greeks, and the main philosophical divisions. He advocates the idea that philosophy was a Greek and not a barbarian invention, despite certain intimations of wisdom among barbarian nations. More importantly, in his prologue Diogenes introduces two notions that are crucial for the arrangement of his entire work, namely the notion of succession (*diadoche*) and that of a philosophical sect (*hairesis*). He arranges philosophers in two main successions, the Ionian and the Italian. The Ionian succession starts with Anaximander (going back to the Seven Sages) and goes down to the Stoics through Socrates, Plato, and the Peripatetics (it covers books 1–7), while the Italian succession starts with Pythagoras and continues with the Eleatics and the Atomists to end with Epicurus (books 8–10). Diogenes also distinguishes between dogmatic and sceptic (ephectic) philosophies. Then, following ancient doxographical literature, he gives us a list of the various philosophical sects and the names of their founders. Philosophers who do not belong to a sect and are only part of successions, like the Presocratics, are dispersed in various parts of the work.

The work seems finished as we have it (cf. 10. 138) but book 7 appears incomplete in the existing manuscripts, which leave off in the middle of a title in the list of Chrysippus' works. Each section in Diogenes' works has two main components, the biographical and the doxographical. Diogenes tends to follow a certain order in the arrangement of his material (origin, education, place in succession, sayings, anecdotes, works, doctrines, documents, other men with the same name). His usual practice is to give only the doctrines of the founder of the school, ignoring the additions and variations brought up by the successors. The sole exception is the Stoic school (book 7). The idea is that the founder's doctrines determine the philosophical point of the entire sect. Plato and Epicurus occupy one book each; Zeno the Stoic also enjoys an extensive presentation. The account of Plato presents clear similarities with Middle Platonist treatises of the 2nd century AD such as Albinus' *Isagoge* and Alcinous' *Didaskalikos*. The lists of works that Diogenes gives are invaluable since they tend to be quite comprehensive. Nevertheless Diogenes himself is unlikely to have consulted the original works of the philosophers he discusses, though in the case of Epicurus he cites three original Epicurean texts.

Diogenes' treatment of the various philosophers and philosophical schools is very uneven, and this obviously reflects the state of his sources. As far as the biographies are concerned, some of them consist of just anecdotes and apophthegms (Thales 1. 22–44, Polemo 4. 16–20), some contain only doxography (Anaximander 2. 1–2, Leucippus 9. 30–33), some are very long and well informed (Plato 3, the Stoics 7), others are very short (e.g. Aristotle 5. 28–40). As far as his doxography is concerned, the Stoic one is clearly the best of his whole work, whereas Aristotle's doxographical section is very poor in extent as well as in quality.

The problem of Diogenes' use of the sources is a complicated one. He does not seem to follow any one principal source in his work, and in most cases he uses more than one authority, which he usually names. His principal sources are Antigonus of Carystus, Sotion, Hippobotus, Hermippus, Favorinus, Apollodorus of Athens. Like his sources, Diogenes' technique is to combine and excerpt various authorities (cf. 4. 1, 10. 29). This, however, does not mean that his book is

merely patchwork. There is a clear structure behind the whole work, and there are also certain features that characterize his authorship. Yet the use of sources often determines Diogenes' reliability, which varies considerably from book to book and from section to section.

Diogenes' work is definitely a bad history of philosophy by our standards. The author is uncritical about the doxographical material that he reproduces; he does not venture any personal comments; the quality of his information varies considerably; and he has little sense of history. Yet Diogenes did not mean his work to be a history of philosophy in the modern sense. His intention was to present philosophers rather than their philosophy or the historical development of philosophy. His work is chiefly indebted to the genres of successions (*Diadochai*) and of philosophical sects (*Peri haireseon*) that provide the main components of his work, namely the historical-biographical part and the systematic doxographical part respectively. Yet it is difficult to classify Diogenes' work under a specific genre since, for all we know, no earlier work is exactly like his.

Diogenes' work is invaluable today because it is so rich in material from sources that have been lost. This is the only work of its kind that has survived intact from antiquity. Many Hellenistic sources are principally or solely known from Diogenes. His account of Stoic logic, for instance, is important for the reconstruction of Stoic logic. His work is not mentioned by later ancient sources. It seems, however, that it was used by the Byzantines. Stephanos of Byzantium (6th century) quotes Diogenes. The Byzantine lexicon of the *Suda* (10th century) draws heavily on his work for its philosophical entries. Furthermore the compiler of the *Anthologia Palatina* also knows and makes use of Diogenes.

Diogenes of Sinope

Philosopher of the 4th century BC

The oddest group of philosophers in ancient Athens were the Cynics, the dogs of philosophy, whose best-known representative was Diogenes of Sinope. It is not merely that people found (and still find) it easy to make fun of their way of life, for Athenians also poked fun at Socrates (most notably portrayed as a woolly-minded thinker and teacher of sophistries in Aristophanes' *Clouds*), Plato (also a target of comic poets), and Epicurus (whose moderate hedonism was exaggerated beyond recognition). Their oddity lies in the fact rather that they were considered philosophers at all, given that their odd way of life was based on a kind of return to nature that seems antithetical to the reasoned arguments of philosophy such as were found in Plato's Academy, Aristotle's Peripatos, Epicurus' Garden, and Cleanthes' Stoa. As Antisthenes, the first Cynic, said, "Virtue lies in action, not arguments or learning", requiring nothing more than "Socratic strength". Ideology, then, or movement, rather than philosophy, better describes ancient Cynicism.

Humankind is not only unique among creatures in being capable of advance through intellect and technology, but in also being capable of arguing that it has gone too far and should regress and, to quote a Cynic, "live in accord with nature". One finds the germ of this implicit in the general Greek belief that life need not be luxurious and that one can be happy without the fancy clothes, perfumes, and food of the Persians and Lydians. Socrates, Aristotle, and others specifically argued that wealth contributes nothing of essence to true happiness. It was the Cynics, however, who set out the results of their animal studies showing that mice and dogs seem happy without clothes, fancy food, and any but the most primitive housing, and, perhaps most significantly, with little in the way of social niceties. If dogs can snarl, why should humans gloss over the truth with social pieties?

The Cynics' status as philosophers was maintained, presumably on the basis of their arguments for their way of life, but none of their undoubted philosophical writings are extant (except for some spurious letters). What we have instead is primarily a series of telling, Zen-like, anecdotes designed to demonstrate in summary fashion the Cynics' attitude towards themselves and their fellow humans. Anecdotes of this sort are usually to be treated with great distrust, since all conform to the new Hellenistic fondness for literary biography; if used cautiously, however, they probably do paint a generally true picture of the Cynics' manners and teaching technique. Many of those anecdotes ascribed to Diogenes, moreover, depend upon a wicked (i.e. cynical) love of verbal play (almost always lost in translation) which grants them greater credence. In front of two badly painted Centaurs, for example, Diogenes asks "Which of them is Cheiron?", the famous Centaur whose name can also be read as *cheiron*, "worse".

The origin of the school was traced to Antisthenes, a follower of Socrates who was present at his death. It may well

have been that the Cynosarges (White Dog) gymnasium where Antisthenes taught originally suggested the name Cynic for the school associated with him, but the association with dogs was one that the Cynics themselves would happily embrace. From Socrates, Antisthenes learned to emphasize the teaching of virtue for man's happiness; he also learned to emulate Socrates' endurance of physical hardship, raising this, as Socrates did not, to a tenet of his moral philosophy. Diogenes extended this to such an extent that he was said to be "Socrates gone mad".

Whether Antisthenes actually called himself a Cynic and whether others so regarded him is disputed. There is no doubt, however, that Diogenes, from the town of Sinope on the Black Sea, became and remains today even in popular belief the Cynic par excellence: living in a pithos (a large ceramic vessel) which he chilled in winter and heated in summer, eating without utensils, and snarling in mock canine fashion at all who approached him civilly, he outdid Timon of Athens in misanthropy. A particularly apt biographical anecdote has him forced to flee Sinope for having debased the coinage, erroneously having taken an oracle of Apollo too literally: it was rather the metaphorical coinage of civility that he was meant to debase. In Athens, the natural place for a philosophically inclined youth to visit, he fell in with both Antisthenes and Plato. With the former he developed his cynical ideas; to the metaphysical and political views of the latter he developed a marked antipathy which shows up in many of the stories. When, for example, Plato defined man as a featherless biped, Diogenes held up a plucked chicken as something that met the two criteria. Plato's theories of Ideas came in for even harsher criticism. It is usually assumed that Diogenes' *Republic* was written to counter and doubtless to mock Plato's *Republic*.

Whether Diogenes did in fact write this or any other work is a matter of dispute, however. Whereas some sources specifically say that he wrote nothing, others not only list the genres in which he was said to have written, they also quote passages from them. In addition to philosophical dialogues and epistles, Diogenes is credited with tragedies in which he seems to have defended strange positions. In the *Atreus*, for example, the eating of human flesh was shown in a favourable light, just as Diogenes seems to have argued in his prose.

It is understandable that anyone who called himself a Cynic would regard Diogenes as a model. Suitably tempered, however, Cynic ideas of endurance, self-sufficiency, living in accord with nature, and deriving pleasure from the bare necessities of life proved attractive to other schools of philosophy, especially the Megarians, Stoics, and Epicureans. Diogenes' skilful manipulation of words, moreover, provided a model for such Cynical writers as Menippus, Meleager, and Cercidas among Hellenistic Greek writers, and, among the Romans, Seneca, whose *Apocolocyntosis*, a biting satire in both prose and poetry on the emperor Claudius, was modelled on Menippus' satires.

DAVID SIDER

Biography

Born towards the end of the 5th century BC in Sinope, Diogenes was the archetypal Cynic philosopher. Exiled some time after 362 BC, he moved to Athens where he associated with Antisthenes and Plato. Living as close to nature as possible, he took shelter in a *pithos* and behaved like a dog. His writings have not survived. He died in the 320s BC.

Dionysios of Phourna *c.*1670–after 1744

Painter and writer

The Hieromonk (priest-monk) Dionysios, who was also a painter and writer, was born *c.*1670, the son of the village priest of Phourna, a remote village in Eurytania, central Greece. He was orphaned as a child, and at the age of 12 travelled to Constantinople, probably to complete his education. At the age of 16 he went to Mount Athos, and from the early 18th century became established as a painter there; in 1711 he carried out the fresco painting of what may have been his first extant work, the *kellion* (small monastic settlement) that he had dedicated to St John the Baptist in Karyes. He continued working as a painter throughout his life, and his known oeuvre contains a number of other paintings, both frescos and portable icons; among the latter are six icons which are still kept in the church of his native village of Phourna. Wall paintings attributed to him include those on Mount Athos in a *parekklesion* (minor church) of Vatopedi and in the *katholikon* (main church) of Docheiariou; the painting of the interior of the village church at Phourna, dedicated to the Transfiguration, which was destroyed in 1821, was also by him.

Dionysios was also the author of two liturgical works, *akolouthies* (rites) of the holy martyr Seraphim, metropolitan of Phanarios, who was martyred in 1611, and of the Virgin of the *Zöodochos Pigi* (Lifegiving Spring). He died some time after 1744, but the date and place of his death are unrecorded.

Although he had a number of pupils, Dionysios' fame rests almost entirely on a text which he wrote probably during a second visit to Mount Athos in the years 1730–34; he called it the *Hermineia tis Zographikis Technis* (Explanation of the Painter's Art). While the work can be seen in the long tradition of medieval artists' manuals, which were largely technical in their approach, its scope is far wider than any previous compilation of this kind. Its importance for the Hellenic tradition lies in two separate aspects of the text and its treatment. The first

aspect concerns the way that its content and approach are related to the historical conditions against which it was produced. By Dionysios' lifetime Greece had for over two centuries been occupied by a foreign, Muslim power, with no apparent prospect of liberation, and to a large extent Dionysios probably saw his task as one of codification of the long tradition of Byzantine and post-Byzantine artistic practice as it had developed down to his day. The second is due to the wide dissemination of the *Hermineia* in the Eastern Orthodox Church, which took place mostly after his death, but which had the effect of transmitting the practice of what he wrote to a much wider audience than he could have anticipated.

The *Hermineia* is divided broadly into three parts. After initial instructions regarding the artist's preparations for his work, the first part deals exclusively with instructions of a technical nature, including the making of brushes, the mixing of different colours, the preparation of varnishes, and the correct proportions of the human figure. In this respect the *Hermineia* follows the medieval or late medieval tradition of artists' manuals, the best known of which are those by the 12th-century monk Theophilos and the 14th-century Italian painter Cennino Cennini; passages from both these authors are traceable in Dionysios' work.

It is in the second part, which forms more than half the text, that Dionysios gathers together and presents the iconographic traditions of a wide range of Byzantine art as they had developed in the post-Byzantine period. This remains the most significant and widely used part of the *Hermineia*. Major episodes from the Old and New Testaments are covered here, including sections devoted to the life and parables of Christ, the life of the Virgin, and the whole of the Revelation of St John, with the *Akathistos Hymn*, the Ecumenical Councils, and miracle cycles of individual saints. Dionysios includes a martyrology for the whole of the ecclesiastical year and lists many groups of biblical and post-biblical figures: the ancestors of Christ, the holy women of the Old and New Testaments, the prophets with their relevant texts, the apostles, the bishops with their texts, the stylites, deacons, martyrs, hymnographers, and many other saints are all mentioned. He also describes at length how large-scale compositions only began to appear in post-Byzantine art such as the *Pasa Pnoi* ("Let everything that hath breath") and the *Anothea i Prophitai* ("Prophets from above").

Dionysios' method is to describe the essential elements of each scene, or the characteristics of each individual, in a way that provides an artist with sufficient basic information to depict the subject. A few sources that Dionysios must have used have been identified; the sequence of scenes of the Apocalypse is based on an early 16th-century series of woodcuts published in Basel, and the group of hymnographers that he calls The Poets derives from the title-page of a Greek service book published in Venice in 1600 by a Greek bishop, Michael Margounios. For the most part, however, this section of the *Hermineia*, in which the practice of post-Byzantine artists working in Greece at that period is gathered and codified, must have been substantially compiled by Dionysios himself. Indeed, he wrote that his work had been one of lengthy assemblage and compilation.

The third part of the *Hermineia* concerns the distribution of the canon of Byzantine subject-matter, as described in the second part, within the various buildings of an Orthodox monastery: the *katholikon*, refectory, and fountain (the scenes within a *katholikon* can of course be found in any post-Byzantine church).

Although Dionysios' text could never have had the force of ecclesiastical law, its importance lies in the way that it seems to have been adopted by artists of that and subsequent periods as representing an accepted tradition which should be followed when any subjects within the normal canon of post-Byzantine art were to be depicted. The fact that it appears to have fulfilled a need that was widely felt at the time is shown by the large number of versions of the text which were produced in the later 18th and 19th centuries. There are seven manuscript versions in the monastic libraries of Mount Athos, and further examples in public collections elsewhere in Greece. A translation into Romanian in the early 19th century, of which several versions are preserved in Bucharest, disseminated the text further in that area of the Orthodox world. A number of manuscript versions remain in private hands. All extant versions differ from each other in some degree.

The autograph of Dionysios' text has never been located, and the most complete manuscript is in St Petersburg; it is this version which was edited and published in 1909. This edition was inaccurate in a number of ways, and in 2000 a revised text was published giving the corrected form of the St Petersburg manuscript.

Dionysius I *c.*430–367 BC

Tyrant of Syracuse

The most significant Greek ruler before the great Macedonians, whom he prefigured in many respects, Dionysius belonged to the upper class of Syracuse in Sicily. The most powerful of western Greek cities, Syracuse resembled Athens in some ways, except for the political instability that characterized it in common with most other Siceliot cities – constitutional government tended to alternate with lengthy periods of tyranny. A number of factors were responsible for this, the most important being the ever-present danger of conquest by Carthage. The establishment of Dionysius' autocracy was the direct outcome of the large-scale Carthaginian invasions of Sicily of 409 and 406 BC. His rise to power was a classic instance of how tyranny could be achieved through demagogy, and it is cited as such by Aristotle in the *Politics*. Threatened by the complete collapse of Greek Sicily in the face of the advancing Carthaginian army, the people of Syracuse elected Dionysius first as a general and then as sole general with full powers to deal with the danger that threatened. Shortly afterwards he tricked the army into providing him with a bodyguard, and instead of a saviour Syracuse found itself saddled with a master. Some time passed, however, before Dionysius was firmly in control and during this time he withstood two revolts, the first by the aristocratic cavalry and the second by the people in general. The latter revolt was suppressed, it would appear, with the help of Sparta. This marked the start of close cooperation between Sparta and the tyrant that served the interests of both, but gained Sparta much opprobrium. Between the revolts Dionysius signed a treaty with Carthage whereby the Carthaginians were left in control, whether direct or indirect, of most of Sicily, including all the Greek cities they had captured, while the tyrant was confined to little more than Syracuse (405 BC).

During the next few years Dionysius first extended his rule in eastern Sicily and then embarked on a programme of massive rearmament aimed against Carthage. Clearly he had not intended the settlement of 405 BC to be of any permanence. We hear of new types of warships and war engines being invented at this time. Launched in 398 BC, his attack on Punic-controlled Sicily met with initial success, including the capture of Motya, the Punic stronghold in western Sicily. He was then, however, forced to retreat after a counter-attack and, when his fleet was defeated off Catane, he found himself besieged at Syracuse. At this critical juncture a plague killed many of the besieging forces. Attacking, Dionysius destroyed most of the Carthaginian fleet and then, as a result of a secret deal (or so we are told), allowed the Carthaginians themselves (as opposed to their allies and mercenaries) to sail away with what remained of their navy (396 BC). Though seriously weakened by his reverses, he recovered quickly and was able to check another Carthaginian campaign initiated in 393 BC. A stalemate having been reached, a new peace treaty was concluded (392 BC) which was much more favourable to the tyrant: all Greek Sicily was to be under Dionysius, and Carthage retained only the western corner of the island.

It was now the turn of Greek Italy. By a combination of military victories and clever diplomacy Dionysius soon succeeded in weakening the Italiot League and, having come to terms with it, in capturing Rhegium, a bitterly hostile city. He thus gained control of the strait of Messana, and annexed to his territories the whole of the toe of Italy. By 387 BC he was free to send to the Aegean a strong naval squadron to assist Sparta and Persia in imposing on Greece the infamous King's Peace. The 380s BC also witnessed the expansion of Dionysius' empire into the Adriatic, where he planted colonies and formed an alliance with the Illyrians. His main aim must have been the acquisition of vital resources in men, but above all of materials. A punitive raid in strength against the Etruscans (*c.*384 BC), traditional allies of the Carthaginians against the Greeks, must also have been motivated by a wish to improve his finances further, in preparation for another war with Cathage.

The Third Carthagianian War broke out in 383 BC and continued well into the 370s BC. It was fought by Dionysius on two fronts, in Sicily as well as in Italy, against both the Carthaginians and the Italiots who made common cause with Carthage. It is unfortunate that our main source for Dionysius (Diodorus Siculus) chose to give only a very brief and vague summary of what clearly was a major conflict. Victory went to Carthage. In the treaty that ended the war Dionysius was forced to recognize Himera as well as all Greek land west of the river Halycus as belonging to Carthage. He also had to pay a heavy indemnity. There was to be yet a Fourth Carthaginian War. Carthage, weakened by plague and a revolt of its subjects, invited attack by Dionysius in 368 BC. By then he had recovered sufficiently to be able to send mercenary forces to aid the Spartans (hard pressed after the disaster at Leuctra in 371 BC) at the same time as fighting Carthage. As in 398 BC, initial success was followed by reverses. Having concluded a truce in the winter, Dionysius died in the following year (367 BC). His son and successor Dionysius II subsequently made peace with Carthage on the same terms as his father in the 370s BC.

Though clearly a tyrant in the traditional Siceliot mould, characterized above all by disregard for convention and in holding life cheap, Dionysius nevertheless was a military despot on an altogether grander scale. In the level and range of his activities he bears comparison with the Hellenistic rulers, not least in the way he prepared for and waged war, on both land and sea. Here he was way ahead of his time. Brave, energetic, ambitious, cultivated (he was a poet of some ability), resourceful, with few scruples to inhibit his actions, Dionysius exercised absolute control over a much larger area and population than any other Greek before him. In an age when oligarchy and monarchy were viewed with ever-increasing favour by the Greek intelligentsia at the expense of democracy, Dionysius' one-man rule could not fail to attract attention. No less a thinker than Plato took the trouble to visit the tyrant, and the influence that Dionysius exerted on Greek political philosophy, for better or worse, is one of his main, if rather intangible, legacies. On the one hand Dionysius can be said to have stemmed, temporarily at least, the advance of Carthage in Sicily. His policies, on the other hand, all calculated to increase and maintain his power, especially his reliance on (mostly barbarian) mercenaries and the wholesale destruction of Greek cities and the transplantation of their populations, undoubt-

edly undermined the morale and sapped the stamina of western Hellenism.

P.J. STYLIANOU

Biography

Born *c.*430 BC, Dionysius came to power in Syracuse in 405 BC as a direct result of Carthaginian attacks on Sicily in 409 and 406 BC. Consolidating his position with the help of Sparta, he made himself master of all Greek Sicily, confining Carthage to the western corner. He then (387 BC) extended his influence into south Italy as far as the Adriatic and was active against the Etruscans. After further fighting with Carthage he died in 367 BC and was succeeded by his son Dionysius II.

Dionysius of Halicarnassus

Historian of the 1st century BC

In the second half of the 1st century BC a literary trend developed which was to have the greatest impact on the future course of Greek literature down to the Byzantine age and even beyond. It was the time of the quite spectacular breakthrough of Atticism, according to which speeches and literature should be modelled after the great authors of Classical, i.e. pre-Hellenistic, times. Most prominent among the initiators of this movement were the rhetoricians and historians Caecilius of Caleacte and Dionysius of Halicarnassus.

When Dionysius arrived in Rome in 30/29 BC, the capital had already become a centre for Greek intellectual activity. Dionysius does not seem to have had any difficulties in finding Greek and Roman friends and patrons, among whom Caecilius was the most remarkable literary figure and Quintus Aelius Tubero, jurist, annalist, and father of two consuls, the most influential political personality. Dionysius wrote many rhetorical and critical treatises for these friends and was a private teacher to their sons. But he devoted most of his time to composing his monumental work on early Rome, the *Roman Antiquities*.

In the preface to his study *On Ancient Orators* – a singular manifesto-like text – Dionysius unfolded a tripartite conception of history: the heyday of the "old philosophical rhetoric", he declared, was followed by a period of decay after the death of Alexander the Great, but the time in which he lived saw a powerful revival of the time-honoured "Attic" rhetoric. Dionysius attributed this change to the influence of Rome and its well-educated elite. In this conception, the orators and authors of the good, older time were regarded as classical models with normative power, whereas the whole literature of the Hellenistic period he rejected as "Asianic". In order to produce good speeches and literature, so Dionysius argued, one had to turn to the classics and imitate them. In his rhetorical and critical studies Dionysius attempted to show which authors were worthy of imitation (*mimesis*), how imitation should work, and which qualities in particular should be espoused, and which mistakes avoided. Dionysius thus proposed an eclectic procedure combining the good qualities of several Classical authors and at the same time avoiding all their flaws. By this means one could hope to rival the classics or even to surpass them. Dionysius took it for granted that the Classical authors had already proceeded in this way themselves: most successful of all the Attic orators, according to Dionysius, was Demosthenes, whose "mixed style" he therefore preferred.

The tremendous success of Atticism is clearly illustrated by the fact that, whereas Hellenistic literature was for the most part lost (except for some more technical works handed down because of their content), the works of the Classics (as well as those of the Classicists) have been preserved to a remarkable extent. This was possible only because Classicism was readily embraced and disseminated by the rhetorical schools. As far as we can see, it is in Dionysius' treatises that literary criticism is for the first time pursued not primarily as a means to explain a given text or author but almost exclusively in order to provide material for imitation. It is obviously for their practical value that these critical studies have often been read and thus have mostly been preserved. In the 1st century AD they were cited several times by the Roman rhetorician Quintilian, and the unknown author of *Peri Hypsous* (On the Sublime) clearly knows them, although there is no explicit reference. For instance, the latter used the critical device developed by Dionysius of rewriting a certain passage in order to show how important its rhythm is. The unknown author of the pseudo-Plutarchean treatise *On the Ten Orators* uses many passages from Dionysius without indicating his source, whereas an anonymous commentator on book 2 of Thucydides replies to some of the criticism made by Dionysius in his study *On Thucydides* (P.Oxy. 853; 2nd century).

In the 2nd and 3rd centuries AD Atticism became increasingly concerned or even obsessed with the purity of language. Purists of the time would accept only the vocabulary and the syntactical formations found in the Attic authors. For Dionysius and Caecilius, Atticism had been primarily a matter of style, but clearly the purism of the Second Sophistic would not have been possible without the success of stylistic Atticism. Indeed, in the 9th century the patriarch and scholar Photios was to criticize Dionysius' use of neologisms (cod. 83), which were, of course, profoundly antipathetic to purists. Nevertheless, Dionysius' treatises continued to be used – for example, by the rhetorician Hermogenes, still in the 2nd century – although direct references are rare, and even more extensively with many direct citations by his commentators, namely Syrianus (4th/5th century). As the Hermogenic corpus became the standard rhetorical textbook for the whole Byzantine period and was still much in use in the Renaissance,

Dionysius' authority remained unquestioned throughout the centuries. He was read by the rhetorician Libanius and the sophist Lachares (4th/5th century). An anonymous rhetorician, perhaps John Doxapatres (11th century), was a particularly fervent admirer, as he calls Dionysius "the master and good father of our art". Another anonymous rhetorician of the 10th/11th century, who wrote a commentary on Hermogenes, cited passages from many different treatises and seemed to know the whole of Dionysius' critical work. John Sikeliotes (12th century), a better-known commentator on Hermogenes at the time, refers directly to Dionysius. Epitomes have been made of the studies *On Imitation* and – probably in the 10th century or perhaps by Maximos Planudes (13th century) – *On Stylistic Composition*. The latter work was also widely used by Psellos (11th century), whose study *On the Composition of the Parts of Speech* consists to a large extent of extracts from it.

Of the 20 books of the *Roman Antiquities*, books 1–10 have been preserved entirely and book 11 partly. Books 12–20 survive only in excerpts, about one half of them from the collection made of Classical and later historians by order of the emperor Constantine VII Porphyrogennetos (10th century), and the other half from an epitome preserved in a 15th-century manuscript. According to Photios, who could still read the complete work (cod. 84), Dionysius had himself made an epitome in five volumes. The history extends "from the oldest myths ... to the beginning of the First Punic War" (1. 8. 1f), i.e. the year 264 BC, with which Polybius' history begins. Dionysius designed the *Antiquities* as a model for what can be produced by eclectic *mimesis*, but he also had a political message and an educational aim: he attempted to show that Rome was in fact a Greek foundation, Latin a Greek dialect, and the early Romans indeed Greeks – not only ethnically, but also in terms of their high moral standards. Dionysius thus justified Roman rule over the Greeks and at the same time presented Roman statesmen of the past as models for those of the present. Dionysius wished to be an educator like Isocrates, aiming to teach both good behaviour and good speaking.

The *Roman Antiquities* seems to have been quite popular, although direct references are few. Josephus' *Jewish Antiquities* in 20 volumes is obviously modelled on it, as are some aspects of his style. Plutarch used it for some of his *Lives*; in some cases (e.g. for the *Coriolanus*) it was his main source. Appian and Cassius Dio also seem to have referred to the *Antiquities*, though perhaps through an intermediary source. As a note by an anonymous writer in the earliest manuscript of Appian makes plain (cod. Vat. graec. 141; 11th/12th century), the account of Italian history and the earliest history of Rome were the most popular parts (hence perhaps the loss of the later books). In the Byzantine period the *Roman Antiquities* was used by Constantine Manasses, who drew on it for his *Chronike Synopsis* (12th century), as did John Kanabutzes (15th century) for his little geographical-historical miscellany *In Dionysium Halicarnassensem Commentarius*.

Over the last 200 years Dionysius has often been criticized and even despised for his hated Classicism and his positive approach to Rome. It should be borne in mind, however, that his Isocratean ideal of education (*paideia*), based on a sound knowledge of the Classical authors, proved to be one of the most important and persistent factors of Greek elite identity for many centuries.

THOMAS HIDBER

Biography

A native of Halicarnassus, Dionysius moved to Rome in 30 BC where he taught rhetoric for many years. He also wrote many works of literary criticism, notably on Thucydides and the Attic orators. But his principal work was entitled *Roman Antiquities*, a history of Rome from its beginnings to the start of the First Punic War (where Polybius begins), in 20 books, of which books 1–10 survive intact, book 11 in part, and the rest only in excerpts. His thesis was that Rome was a Greek city, Latin a Greek dialect, and Romans really Greeks.

Dionysius the Areopagite, pseudo-

Author of a corpus of Christian writings of *c.*AD 500

The Dionysian corpus includes ten letters and four treatises, which most manuscripts arrange in the following order: the *Celestial Hierarchy*, the *Ecclesiastical Hierarchy*, the *Divine Names*, and the *Mystical Theology*. The author purports to be the Dionysius who was converted by Paul's speech on the Areopagus (Acts 17: 34), and was subsequently identified both with the first Athenian bishop and with St Denis of France. The Renaissance scholars Lorenzo Valla and Erasmus, however, proved to the satisfaction of most Protestants that the ascription is pseudonymous, and since the work of Josef Stiglmayr and others in the early 20th century, even Roman Catholics have generally admitted that Dionysius wrote under the influence of the Neoplatonist Proclus, who died in AD 485. Since the first external attestation of his work occurs in 532, it is plausible to suggest that he wrote between these dates; the conjecture is confirmed by his assumption that the Nicene Creed is a regular part of the Eucharistic liturgy, which was not true anywhere before 476. Most scholars assign the author to a Syrian (though not Syriac-speaking) region, and since his doctrine of the Incarnation seems to dwell on Christ's divinity at the expense of his humanity, it is generally supposed that he was trying to lend an apostolic colour to the Monophysite position after the Council of Chalcedon of 451. At the same time, the philosophical elements in his work suggest that he hoped to make his own religion credible to pagans, or else to make philosophy more palatable to Christians in the years before Justinian's closure of the Athenian schools in 529.

The apogee of Dionysian thought is reached in the *Mystical Theology*, which asserts that every positive or kataphatic statement about the Deity is bound to be inadequate, and his nature is best apprehended through the negative or apophatic language that denies him every mundane attribute. Even the negations are alleged to partake of falsehood, since no phrase will suffice to comprehend the divine infinity; a simultaneous denial of every predicate, transcending all particular negations, would appear to be our closest approximation to the majesty of God. Nevertheless, Dionysius knows that scripture and tradition allow us to say that God is good, wise, just, and even beautiful; according to the *Divine Names*, it is possible to credit him with these properties (and goodness first of all) because he is the cause of them in us. In his own being God has them "superessentially"; in a single act they constantly proceed from and revert to his inner nature, so as to be at once imparted to us and recognized as his. In a passage ascribed to one "Hierotheus" this benevolence is said to express the love that is of God's essence; the biblical word *agape* is regarded as interchangeable with *eros*, which in the Neoplatonic vocabulary denotes the yearning of the soul to be like God (*Divine Names*, 4. 13–17). The Neoplatonic influence is most marked in the subsequent digression on the origin of evil (4. 18–35), which is said to stem not from God but from his creatures and to be nothing but a deficiency of good.

Affirmation descends from what is most like God, negation ascends from what is most unlike him. From symbols such as light or rock, we ascend to reflective knowledge, then from knowledge to an awareness of our unknowing. Knowledge of God is both conveyed and symbolized by the ninefold order of angels and the threefold order of clergy, which constitute the celestial and ecclesiastical hierarchies. The purpose of the clergy is to purify and illuminate the soul, which is thus made perfect for communion with God. There is a threefold order of laymen (including monks) to match the clergy, and in all the ranks of being it is a rule that the higher is present in the lower, but not vice versa. The consequence is that people can receive true knowledge of God through various symbols, according to their capacity for reception; such material sacraments as baptism and the Eucharist are always efficacious, though only when their meaning has been fully understood can they accomplish the perfection of the soul. The letters, addressed to fictitious correspondents, introduce the thought of the writer, and supply historical details to corroborate his pretensions. Reference is also made to a *Symbolic Theology*, which (if it ever existed) is now lost.

From the first discovery of his writings, Dionysius was suspected of being more Platonist than Christian; even in the latter guise, he appeared to show undue favour to the Monophysites and to be deficient in knowledge of the Trinity. The commentary of John of Scythopolis dissipated most of the objections, and the advocacy of Maximos the Confessor, who was certainly no Monophysite, secured Dionysius' place among the Fathers of the Eastern Church. Where the careless author had cited Clement of Alexandria (*Divine Names*, 5. 9, thus according to this late-2nd-century writer his true deserts as the founder of the apophatic tradition), Maximos pretended that he meant the 1st-century bishop Clement of Rome. It is all the more remarkable that when Maximos composed a mystical commentary on the Liturgy, he put the Incarnation at the centre, and made little use of the author whom he believed to have been a friend of the apostles. John Damascene treats him as a sure authority, and during the hesychast controversy both Palamites and their adversaries took refuge in his name. Even now, many monks would be unwilling to accept that "Dionysius" is a pseudepigraphic title.

Just as he transcended the division between Monophysites and Chalcedonians, so Dionysius was able to bridge the schism between the Eastern and Western Churches. The West first learned of him through John Scotus Eriugena (*c.*900), who translated the commentary by John of Scythopolis, together with some works by Maximos; from this time on, despite the heterodoxy of Eriugena, it was difficult to join a debate within the Roman Church without deferring to the Dionysian writings. Protestants have until recently portrayed him as the archpriest of the "*eros*-type" theology, which exaggerates our natural worth and puts our own self-seeking love of God in place of his sacrificial love for us. Yet the God of Dionysius is never so impersonal as the One of the Neoplatonists; the symbols of procession and reversion express his loving condescension to humanity, and *eros* in the Dionysian writings, as in Origen and Ignatius, is an appellation of Jesus on the cross. Modern scholars, stressing his use of scripture, his belief in the Incarnation, and his devotion to the sacraments, have generally agreed that Dionysius was a Christian before he was a philosopher, and that his churchmanship is more than a veneer.

MARK EDWARDS

Biography

Although in his writings he purports to be the Dionysius who was converted to Christianity by Paul's speech on the Areopagus, it is now generally agreed that the attribution is pseudonymous and that this anonymous writer wrote *c.*500. He stressed that the nature of God can only be defined by negatives, and was much influenced by Neoplatonism.

Dioscurides fl. *c.*AD 45–75

Physician

Pedanius Dioscurides of Anazarbus in Roman Cilicia (south-eastern Asia Minor) wrote *On Materia Medica*, one of the more influential pharmacological works of the pre-modern period. The preface suggests that he studied under Arius in Tarsus and that he travelled extensively to collect information on the medicinal uses of plants, animal products, and minerals. His journeys probably took him to many of the places mentioned in his work, including much of Asia Minor, the Greek mainland, northern Egypt, Syria, Crete, Cyprus, and the Nabataean capital Petra. Following earlier traditions, he also described exotic substances from more remote areas (including Britain, Gaul, Iberia, Ethiopia, Armenia, and India), few of which he is likely to have visited. His explicit association of his pharmacological odyssey ("traversing much of the earth", Preface 4, an echo of *Odyssey*, 4. 268, 2. 364, etc.) with a "military" or "soldierlike life" prompted later writers to draw the controversial inference that he had been a physician in the Roman army.

Several other extant Greek texts are attributed to Dioscurides by later ancient writers and by Byzantine authors and scribes. These include *On Noxious Drugs*, *On Venomous Animals*, and *On Simple Drugs* (also transmitted as *Euporista*, "Readily Accessible Remedies"). A modern critical consensus has, however, rendered their authenticity doubtful.

In scope, thoroughness, and detail, Dioscurides' *On Materia Medica* probably exceeded its many ancient predecessors. He discussed the medicinal properties of more than a thousand natural substances (about 800 of these botanical, the rest mineral and animal), and recorded well over 4,000 uses for them, whereas the works attributed to Hippocrates, for example, had referred to fewer than half as many substances. In his preface Dioscurides criticizes different predecessors by name for different flaws: omitting useful substances, imprecision, false information, second-hand knowledge, and poor structure, resulting in works that are impossible to memorize. His own work, he promises, will be superior in its completeness, accuracy, organization, systematicity, and detailed personal observation, with careful attention to topography, climate, seasons, and local botanical variations, as these pertain to the collection, cleaning, preparation, preservation, and storage of drugs.

Dioscurides' predecessors had listed pharmacological substances under individual disorders (e.g. Hippocratic Corpus) or alphabetically (Crateuas) or according to external, often morphological characteristics (Sextius Niger), whereas the sequence adopted by Dioscurides in his five books is as follows: (1) aromatics, oils, ointments, trees, shrubs; (2) animals, animal products (honey, milk, fat), cereals, vegetables, garden herbs; (3) roots, botanical juices, further herbs, seeds; (4) further roots and herbs; (5) wines, other potables, minerals. The organizational principles that prompted this arrangement are far from transparent, but a recurrent structural device might be grouping together substances according to affinities displayed by their *dynameis* (usually translated "properties"), i.e. by their "powers" to act upon something, for example, by having a heating, softening, astringent, diuretical, drying, cooling, "ripening", somniferous, relaxing, dispersing, aphrodisiac, or antaphrodisiac effect. In all, he identifies more than 300 kinds of qualitative medicinal effects. Yet Dioscurides never explicitly claims such similarities in the "power to effect" as the principle that informs his overall arrangement, and some later readers, not recognizing any consistent, clear structure, reorganized his text to give it a more accessible arrangement. An alphabetical version, probably produced between the 2nd and 4th centuries AD, is extant in a 6th-century manuscript (the "Vienna Dioscurides", see below) and in later manuscripts.

A subsidiary ordering sequence, discernible in the botanical sections, is testimony to Dioscurides' attempt at thoroughness. One chapter is devoted to each plant, and within each chapter the following pattern tends to be maintained: name of the plant; synonyms; typical location; botanical description, medicinal properties; preparation and application; occasional references to harmful side effects; dosage; collection, processing, and storage; forgeries and how to detect them; at times, veterinary, magical and non-medical uses; sometimes geographic distribution.

Each botanical chapter was probably also accompanied by an illustration of the plant, as in the earliest surviving Greek manuscript, the "Vienna Dioscurides". Now in Vienna (Österreichische Nationalbibliothek) this manuscript preserves an alphabetical version of Dioscurides' work. Copied in AD 512–13 in Constantinople for Princess Anicia Juliana, daughter of Placidia the Younger and of the western emperor Olybrius, the Vienna Dioscurides is the most lavishly produced of extant Byzantine scientific manuscripts, preserving almost 500 miniatures, mostly full-page paintings of plants. Different visual traditions are, however, discernible in the manuscript tradition, and it is unclear which, if any, of these derive from Dioscurides' original work. In the Vienna Dioscurides art historians have differentiated between a more abstract group of illustrations and a more naturalistic group, and a Neapolitan manuscript of

the 7th century AD (now in the Biblioteca Nazionale, Naples), containing 403 plant illustrations of an inferior quality, also appears to represent more than one visual tradition. Illustrated pharmacological and other medical works none the less are well attested at least from the Hellenistic period and, modern expressions of doubt notwithstanding, it is likely that Dioscurides' original text, too, was illustrated.

The high regard in which Dioscurides' *On Materia Medica* was held in the Greek world until the early modern period is evident from the frequency with which later Greeks referred to him, quoted him, annotated his text, copied it, and plagiarized it. Dioscurides' contemporary Erotianus quoted him in his Hippocratic lexicon, and in the next generation two great Greek pharmacologists of the Flavian period, Asclepiades the Younger ("Pharmakion") and Andromachus the Younger, took ample account of Dioscurides' work. At the time of the emperor Trajan, Rufus of Ephesus explicitly acknowledged Dioscurides as an eminent authority, and under Hadrian another Ephesian, Soranus, drew on him in his Hippocratic glossary (fragments of which seem to survive in Hesychius' 5th-century lexicon of rare words). In the last six books of his work on simple drugs Galen by and large adapted Dioscurides' views to his own pharmacological system. In the 4th century AD Oribasius (*Collectiones Medicae* 11–13) recorded many lengthy verbatim excerpts from Dioscurides, arranged alphabetically. Writers of the 6th and 7th centuries who drew on (or knew of) Dioscurides' work include Aëtius of Amida (who offers excerpts), Alexander of Tralles, Stephanus of Byzantium, and Paul of Aegina. In the 9th century Photios seems to have had direct access to the *Materia Medica*, which he held in very high regard (*Bibliotheca*, cod. 178).

An impressive copy of the Vienna Dioscurides (New York, Pierpont Morgan Library) was produced in the 10th century. At about the same time Romanos II (emperor 959–63) sent another illustrated version from Constantinople to the caliph of Cordoba. Further evidence of Dioscurides' popularity throughout the Byzantine period is provided by the numerous comments entered in manuscripts of his text by physicians and others. Greek monks in the monastery of St John Prodromos in Petra, for example, made many annotations in the Vienna Dioscurides in the 14th and 15th centuries. A further measure of Dioscurides' influence was the active reception of his work both by the Latin west and by medieval Islam. Early Latin, Syriac, and Arabic translations ensured that for centuries Dioscurides served as a paradigm and source for three major cultural areas: the eastern Greek culture of Byzantium, Islamic civilization, and the western Christian Latin realms.

Biography

Born at Anazarbus in Cilicia, Pedanius Dioscurides (*fl. c.*AD 45–75) studied under Arius of Tarsus and travelled widely in the eastern Mediterranean to gather information about medicinal uses of plants, animal products, and minerals. His work *On Materia Medica* in five books is an extensive and influential study of the uses of drugs in medicine. Several of its surviving manuscripts are beautifully illustrated.

Writings

De materia medica libri quinque, edited by Max Wellmann, 3 vols, Berlin: Weidmann, 1906–14 (the standard modern edition)

The Greek Herbal of Dioscorides, Illustrated by a Byzantine AD *512, Englished by John Goodyer* AD *1655*, edited by Robert T. Gunther, Oxford: Oxford University Press, 1934; reprinted New York: Hafner, 1959

Codex Vindobonensis med. Gr. 1 der Österreichischen Nationalbibliothek, edited by Hans Gerstinger, 2 vols, Graz: Akademische Druck- und Verlagsanstalt, 1965–70 (facsimile of the Vienna Dioscurides with commentary)

Diplomacy

Diplomacy is the peaceful conduct of relations between recognized political entities by means of negotiations. The word "diplomacy" is derived from the French *diplomatie*, which is in turn derived from the ancient Greek *diploun*, "to double". The Latin word *diploma*, so called because it consisted of two sheets of metal shut together like the leaves of a book, denoted important legal documents such as passports, licences to travel, or certificates conferring privileges. Renaissance humanists, perhaps a trifle pedantically, applied the term to all acts of sovereign authority; and eventually the term came to embrace all medieval documents. The word "diplomacy", according to Dr Murray's *New English Dictionary*, was first used in the Anglophone world as late as 1796, by Edmund Burke. Indeed, diplomacy as a uniform system guided by generally recognized rules and conventions is of comparatively recent date, with the rights and privileges of diplomatic agents being defined in a binding manner at the Congress of Vienna of 1815. The

growth of the practice of diplomacy, however, goes back to ancient times. The contribution of the Hellenic world to the evolution of diplomacy is that of ancient Greece and the Byzantine empire.

Ancient Greece

Whether extant evidence of diplomatic activity in Mesopotamia and pharaonic Egypt points to the existence of a diplomatic system is still the subject of academic debate. Evidence of such a system in the case of ancient Greece, by contrast, is abundant and undisputed. Significantly, however, the practice of diplomatic exchanges was confined almost entirely to the Greek world. By virtue of its geographical position ancient mainland Greece was for long periods of its development free from external pressure (although this was of course not so in the case of settlements in the eastern and western peripheries of the Greek world). Under such conditions a cluster of small states emerged, often misleadingly referred to as "city states". The rise of the polis, the "self-governing state", was no doubt aided also by these states' relative isolation in the mountainous terrain of the mainland, which could not easily be traversed. Thus separated by topography, but connected by sea routes, the states needed to develop a means of regular communication. A further incentive for the growth of this protodiplomatic traffic was the fact that no single polis was powerful enough to establish some form of hegemony over the others. The relative equilibrium that resulted and the absence of external pressure meant that individual states dealt with each other on a basis of equality. Their common cultural background and a shared language obviously facilitated the transaction of diplomatic business. Yet, it is also true that Greek diplomacy possessed no conception of norms and rules of proper diplomatic conduct. So intense was the citizen's loyalty to his polis, and so deep was his suspicion of the *xenoi*, the foreigners from beyond the boundaries of his state, that inter-polis relations were highly quarrelsome. But while this characteristic tended to increase the frequency of diplomatic exchanges, it also prevented the emergence of a recognized uniform diplomatic system. What, however, did emerge was a pattern, both administrative and behavioural, that bore surprising similarities to modern international diplomacy.

The modern practice of maintaining permanent diplomatic missions in foreign capitals was, of course, unknown to the Hellenic world. Indeed, this did not become established practice until the heyday of Venetian diplomacy in the 15th century. The hallmark of ancient Greek diplomacy, by contrast, was the frequent dispatch and reception of temporary, or *ad hoc*, legations. The Greeks dealt with foreign-policy issues as and when they arose. The ancient equivalent to the modern ambassador or envoy was the *presbys*, or elder. Chosen for his known respectability and his knowledge of political affairs, he was appointed to a temporary mission to negotiate the settlement of a specific problem with a foreign state.

To the modern observer the most striking feature of Greek diplomacy is its relative openness and the suspicion with which the *presbeis* were often regarded by their own people. Greek ambassadors were generally chosen, by the assembly of their polis, not so much for their skills as negotiators but rather for their representative qualities. The policy to be pursued by the envoys was debated publicly by the assembly, and the negotiating strategy laid down in detailed, and usually restrictive, instructions. The modern practice of furnishing ambassadors with plenipotentiary powers seems to have been virtually unknown in ancient Greece. Such was the suspicion of their own diplomats that the Greeks tended to send missions on a large scale, usually composed of several *presbeis*, not infrequently as many as ten. This practice served a dual purpose. The large number of usually highly skilled orators as envoys was meant to increase the weight of the sending state's case. But, most importantly, it was a device to address domestic needs. Different envoys represented different factions at home. A large mission was therefore broadly representative of the different points of view entertained by the assembly at home. The accommodation of domestic animosities was, however, not conducive to diplomatic effectiveness. Instead of conveying an impression of unity of purpose, a large mission suggested to the receiving polis domestic strife in the sending state. An often quoted example of this was the Athenian mission to the court of Philip of Macedon in 346 BC, which was remarkable more for the strictures uttered by the celebrated rival orators Aeschines and Demosthenes against each other than for its negotiating success. Such personal animosities in large, mixed embassies were thus liable to be exploited by the receiving state. It is indeed remarkable, as Harold Nicolson noted, "that intelligent people should have permitted so bad a diplomatic method to survive".

The openness of Greek diplomacy extended not only to the appointment and dispatch of embassies but also to the transaction of their business abroad. Equipped with credentials issued by their own assemblies, the *presbeis* were led on their arrival to the assembly of the host state. Diplomatic negotiations were conducted orally and, it seems, publicly. The individual members of the mission each delivered a set speech along the lines fixed by their home assembly; open negotiations would then ensue. If an agreement resulted, its terms were engraved in a tablet, to be displayed in public. The ratification of any such agreement was by public exchange of oaths. The public nature of Greek diplomacy may also account for the frequent censuring of the returning mission by its own polis. Occasionally the returning ambassadors were even prosecuted, as for example was Aeschines, whose character had been tarnished by his accepting a bribe from the Macedonian prince, and who was consequently banished to Rhodes.

Another important feature of Greek diplomacy was the evolution of the office of *proxenos*, which was roughly that of the modern consul. In contrast to his modern successors the *proxenos* was a native of his polis, in which he resided while acting on behalf of another state and protecting the interests of the latter's citizens; it did not, however, include conducting diplomatic negotiations. Although the post of *proxenos* was one of honour, and many distinguished men strove to obtain it, the *proxenoi* were also often the leaders of the political faction which was favourably disposed towards the state they represented.

Its ad hoc nature and its public character, the lack of any administrative structure and of record keeping no douht hampered Greek diplomacy. It was largely inconsistent, and the lack of domestic unity often rendered it ineffective. But the

constancy and intensity of diplomatic exchanges, the recognition of diplomatic immunity, or the accepted principles of declaring war and concluding peace all indicate that the Greeks had developed a sophisticated and elaborate diplomatic apparatus. The Amphictionic Council, the leagues, and alliances demonstrate that the ancient Greeks understood the importance of the combinations of forces. The Delian League, for instance, organized and maintained under the hegemony of the Athenians for the better part of the 5th century BC, brought together 200 states in an anti-Persian combination. Without a sophisticated web of diplomatic exchanges such a feat would have been impossible.

Byzantium

Whereas the diplomacy of ancient Greece dealt largely with intra-Greek matters, the later Roman empire at Byzantium developed its diplomatic methods almost exclusively in response to external pressures. Surrounded on all sides by nomadic tribes, and faced with the prospect of frequent incursions by the barbarians, the effective protection of imperial possessions was of vital importance. In this, diplomacy was as important a weapon as traditional military means. Indeed, in view of the ephemeral nature of the "barbarian" political organizations and the protean nature of the threat they posed to the empire, military success often proved elusive. In maintaining peace on the frontiers, the Byzantine government relied not so much on strong defensive installations but above all on the skilful management of the frontier peoples. Especially under the emperor Justinian (527–65) Byzantine diplomacy was developed into "the science of managing the barbarians" (J.B. Bury, writing in the 11th edition of *Encyclopaedia Britannica*, 1911).

The primary objective of Byzantine diplomacy was thus to divide its enemies and to neutralize them by fomenting rivalries among them. It was an elaborate system of keeping one people in check by another, thereby preventing potential adversaries from invading the empire. Given the preoccupation of the Byzantine court with the barbarian world, it is not surprising that one of the bureaux of the central chancellery was the *Skrinion Barbaron*, or "barbarian bureau". The Byzantines were the first to organize a separate government department for external affairs, though very little evidence has survived as to the exact organization of the Byzantine diplomatic service. The foreign office was presided over by the *Logothetes ton Dromon* (the central tax collector), who also controlled the communications between other ministers and the emperor, whom he saw daily. In the 11th and 12th centuries he was principal secretary of state, under the name of Grand Logothete. The Logothete was responsible for the conduct of imperial diplomacy; and, as the latter was primarily concerned with the barbarians, the Logothete's chief responsibility was the collection and organization of information on imperial neighbours so as to facilitate the subtle manoeuvres involved in managing the barbarians. Occasionally the Logothetes also issued general statements on the principles of imperial foreign policy, such as that contained in *De Administrando Imperio* (*c.*950) by Constantine VII Porphyrogennetos.

Among the Logothete's other responsibilities was the reception and formal introduction of foreign envoys to the emperor. Throughout their visit to Constantinople the foreign representatives remained under the strict supervision and constant surveillance of the Logothete; for this purpose they were confined during their stay in the imperial capital to the *Xenodochium Romanorum*, a special government residence for visiting dignitaries. The object of such attention was to ensure that the visitors returned home deeply impressed by the power and riches of Byzantium.

Arguably the most striking external feature of Byzantine diplomacy was its stiff formality, again designed to enhance imperial dignity and to impress foreign representatives. Emperor Constantine Porphyrogennetos' *De Ceremoniis*, a long treatise on the subject of protocol and ceremonial, seems to have served as a manual for his successors. The conjunction of secular and spiritual powers in the hands of the emperor facilitated that task for Byzantine diplomacy. While the foreign representative remained prostrate before the impassive emperor in the sumptuous surroundings of the palace, automata were set in motion to heighten the dazzling effect of glamour and mystery: golden lions began to roar, golden birds sang in trees, and the emperor's throne was lifted heavenwards.

Equally efficient in the manipulation of the frontier peoples was the liberal use of Constantinople's wealth. Ample subsidies were paid to the frontier tribes; and in return they undertook to defend that section of the imperial frontier adjacent to their own territory. The object of such "wise investment" (Steven Runciman) was that of all Byzantine diplomacy: it was to bring the barbarians under Roman influence, thereby eliminating them as a threat to imperial security. Often their chiefs were showered with Byzantine decorations and honours; barbarian princes were married to Roman brides. And the pretenders to the thrones of hostile frontier tribes were always welcome at Constantinople. Once under Byzantine influence, they were then foisted upon their own peoples.

Under the emperor Justinian a new facet was added to Byzantine diplomacy: the close intertwining of religion and politics. Christian propaganda complemented military conquest. The Christian missionary proved an excellent agent of imperial diplomacy, aiding the expansion of Byzantine influence through conversion to Christianity. Subsidies and the sword bought or forced the offering of barbarian support. But Justinian's religious diplomacy engendered their transformation through the penetration of Byzantine ideas. Although this new diplomatic strategy was successful, as for example in Nubia, Ethiopia, southern Arabia, the Caucasian region, and the coast of the Euxine, it was not without risks. Concessions on the part of the imperial power revealed the riches of the empire, and often led to renewed demands from its neighbours. Such a system could not be permanently successful unless it was supported by financial resources and backed up by military power. Byzantine diplomacy involved enormous expense. It flourished for as long as Constantinople's treasury was full. The city's decline as the commercial and financial centre of the Western world also meant the decline of Byzantine diplomacy.

In the 10th century imperial foreign policy was once more reformed and placed on a new basis of carefully formulated principles. Faced with a new powerful threat from two northern nomadic tribes, the Magyars and Bulgars, the science of managing the barbarians reverted to its old technique of creating an artificial equilibrium among its enemies. Each hostile

people had its own potential enemies that could be used as a check and counterbalance. This strategy was set out in detail by Constantine VII Porphyrogennetos in his *De Administrando Imperio*. To be successful, however, Byzantine diplomacy as the art of keeping one enemy in check by another needed to be systematic and well organized. It required above all the constant collection and evaluation of information. Arguably this is the lasting legacy of Byzantine diplomacy. The system of regular reports by ambassadors sent to barbarian peoples or by imperial agents within the empire was adopted by the Venetians in their famous system of the *Relazioni*. "It was the Byzantines who taught diplomacy to Venice; it was the Venetians who set the pattern for the Italian cities, for France and Spain, and eventually for all Europe" (Harold Nicolson).

Disease

The earliest aetiological explanation of disease (*nosos*, *nousos*) in Greek literature is found in Hesiod's mythical description of the Golden Age of man in his *Works and Days* (90–105), a text dating from the 8th century BC. Hesiod envisages a purely masculine society free from the adversities that beset men nowadays – women, toil, and, significantly, disease: only when the first woman, Pandora, opens the jar are diseases released into the world as a punishment to men from Zeus. Henceforward, diseases roam the earth of their own accord, a constant bane to mortals.

This ancient notion of disease, that they are divine in origin and may be a symptom of divine displeasure at mortal misdeeds, was a persistent feature of Hellenic thinking from Homer onwards: at the very beginning of the *Iliad* Apollo sweeps a terrible plague through the ranks of the Achaeans because Agamemnon has insulted one of his Trojan priests (1. 10f.); the plague that devastates Sophocles' Thebes is a result of the religious pollution (*miasma*) brought upon the whole community by Oedipus; "the Sacred Disease", epilepsy, was attributed in antiquity to divine visitation; in the medieval period illnesses such as leprosy could be interpreted as divine retribution.

Yet just as diseases were thought to be inflicted by the gods, so their remedy was sought in prayer and sacrifice. In Greek antiquity many gods and heroes had the power to send and relieve sickness – for example, Artemis was invoked as a healer of women, but Apollo in particular was both the bringer and healer of disease, given the epithets of "doctor" (*iatros*) and "saviour" (*epikourios*). Both Homer's Achaeans and Sophocles' Thebans find a cure for their communal sickness by supplicating Apollo, while in 430 BC at the end of the great plague of Athens a shrine was dedicated to Apollo the Helper at Bassae.

Also important as a healer of disease was Apollo's son Asclepius, the father of Hygeia (Health) and the exemplary physician of the earliest Greek poetry (Homer, *Iliad*, 11. 833; *Hymnus Homericus ad Apollinem*, 210; Hesiod, fr. 50), whose staff with a snake coiled around it is a symbol of the medical profession still. Asclepius had many cult sites throughout Greece, the largest of which was established at the end of the 6th century BC at Epidaurus; there were important sanctuaries too at Pergamum and Cos. The sick sought a cure for their disease through purification, sacrifice, and, above all, the practice of incubation – the patient slept in the sanctuary in the hope of being granted a direct cure or at least of receiving helpful instructions from the god in a dream.

Such appeals to the supernatural for relief from sickness reflect the paucity of defences available in antiquity against disease of often epidemic proportions. Thucydides' account of the Athenian plague in the late 5th century BC (2. 47ff.) is a powerful reminder of the despair and social devastation that such widespread and uncontrollable attacks of disease could produce, while Sophocles' *Oedipus Tyrannus*, produced during the same plague, dramatized the helplessness of a city ravaged by disease. Such epidemics raged through the Hellenic world on a regular basis: in AD 542 devastating bubonic plague gripped Byzantium and the whole Levant; in AD 744–47 plague resulted in the serious depopulation of Constantinople; and outbreaks of plague recurred throughout the medieval period. Whole populations were affected by other diseases too; there was an epidemic of leprosy at the beginning of the 3rd century BC in Alexandria and the disease was endemic throughout Europe in the 11th and 12th centuries, perhaps spread by the Crusaders, while malaria (which was said to have killed Alexander) was rife in the Classical period and again after the fall of Byzantium. Poor sanitation and urban overcrowding, especially in times of war and its aftermath, contributed to the spread of contagious diseases as did travel and trade within the Mediterranean and beyond to the East, to Africa, and to central Europe. Thucydides reports that the great plague of Athens started at the Piraeus.

Yet alongside supernatural ideas about illness which persisted into the Christian era, when saints took over the role of the ancient gods and heroes as healers of the sick, the Greek thinkers of antiquity sought natural explanations for the origins of disease. From the 5th century BC onward in Greece, Ionia, and Sicily there developed a body of knowledge about diseases, their classification, diagnosis, origins, treatment, and even prevention. Theories of disease were linked with contemporary scientific and philosophical doctrines and indeed writers outside the medical profession were interested in the nature of sickness and health; Plato gives a detailed

account of the origin of disease in the *Timaeus* while Aristotle often discusses disease and may have written a work on the subject.

The most important extant collection of writing on disease from the ancient Hellenic world, however, is the Hippocratic corpus, which comprises about 60 treatises, most of which were written between 430 and 330 BC and which was assembled as a body of work probably by Alexandrian scholars in the 3rd century BC. This collection, the first systematic investigation and analysis of diseases and their treatment, takes its name from Hippocrates, the most famous member of a 5th-century BC guild of doctors from Cos who claimed Asclepius as an ancestor. However, no treatise of the corpus can be attributed directly to Hippocrates – the works are anonymous, written by an assortment of medics from Cos, Cnidus, and elsewhere who express a variety of opinions on diseases and their treatment. Some of the treatises are lectures on physiology and anatomy (*On the Nature of Man*, *On the Nature of the Child*, *The Heart*); some deal with the diseases of women in particular (*On the Diseases of Women 1 and 2*, *On the Diseases of Young Girls*); and some offer theories of the influence of environment on disease (*Airs, Waters, Places*) or advice on the treatment or prevention of disease (*Regimen in Acute Diseases*, *A Regimen for Health*). One significant and influential feature of the corpus is the emphasis given to the systematic observation of patients' symptoms – seven books of the collection consist of case notes (*Epidemics 1* and *3* are the earliest and most interesting) and, while retrospective diagnosis can be problematic, many specific diseases from diphtheria to tuberculosis can be identified from these detailed accounts.

Various theories regarding the origin of diseases are put forward by the Hippocratic writers and their ideas are sometimes at variance. There are, however, several unifying features, the most significant of which is an insistence that all diseases are natural rather than supernatural in origin, that "each disease has a natural cause and nothing happens without a natural cause" (*Airs, Waters and Places*, ch. 22; cf. *Science of Medicine*, ch. 6). Even epilepsy is given a natural aetiology by one medical writer who devoted a whole treatise (*The Sacred Disease*) to a discussion of the cause of the sickness and who attacks the "witch doctors and charlatans" who attribute epilepsy to a divine element.

The Hippocratic corpus contains several theories of the natural causes of disease. Environmental factors such as climate and water supply were thought to be responsible when many people in a locality exhibited common symptoms, and the concept of contagion was recognized by Thucydides at least; but a variety of diseases in a population indicated that the cause lay in the individual, specifically in relation to his or her diet and habits. Perhaps the most influential aspect of Hippocratic nosology is the common theory that diseases resulted from an imbalance in the constituents of the body. This idea can be traced back to a follower of Pythagoras, Alcmaeon of Croton, who was influenced too by the theories of the Presocratic philosopher Empedocles who posited that everything consists of four primary elements – air, fire, earth, and water. Alcmaeon claimed that "health is the mixture of the qualities in the proper proportion" (fr. 4 Diels-Kranz, from *c.*500 BC) and that, if this equality of influence (*isonomia*) were disturbed, disease would result. Alcmaeon and many of the Hippocratic writers suggested that imbalances between "primary opposites" such as hot and cold, wet and dry, were responsible for diseases, while other pathological theories were based on an imbalance of humours, in which deficiencies or excesses of the body's "juices" (*chymoi*), particularly bile and phlegm, gave rise to diseases (see for example *Diseases 1*, ch. 2; *Affections*, ch. 1; *Epidemics 1* and 2). The writer of the treatise *On the Nature of Man* added two additional humours, black bile (choler) and blood, to this scheme, and this doctrine of four humours formed the basis of Western medical theory throughout the medieval period and beyond. Physical imbalances that caused disease could result from environmental factors such as geographical location or climatic conditions which rendered individuals "phlegmatic" or "bilious" and thus susceptible to particular pathological conditions (*Airs, Waters, Places* deals with this theme), while an overindulgence in food, drink, and sex was considered especially deleterious to the health – the Apollonian maxim "nothing to excess" exemplifies the Greek attitude to unrestrained behaviour and its consequences in matters of health as elsewhere.

The medical writers of antiquity recognized the importance of preventative medicine as a factor in the avoidance of disease; the treatise *A Regimen for Health* in particular offers advice on diet and exercise. Indeed the typical Greek diet of fruit and vegetables, whole grains, olive oil, and fish, combined with few animal fats and refined food, which remained largely unchanged until the very recent past, may have conferred some protection against many pathological conditions such as heart disease and various cancers.

In the ancient and medieval Hellenic world, prevention was most certainly better than a cure for disease, if indeed a cure could be found. Doctors (*iatroi*) regularly bled and purged their unfortunate patients and, while the efficacy of plants in the treatment of sickness was recognized at least as long ago as Homeric epic and drug therapy may have provided some relief from the symptoms of illness, prescriptions from the ancient pharmacopoeia supplied few if any effective cures for disease. Patients were treated at home. The first civilian hospital was founded in the middle of the 4th century AD by St Basil the Great, bishop of Caesarea, yet hospitals benefited only a few and attempts to prevent and treat disease were largely inadequate until the very recent past; as recently as the 1960s one study of health and disease in the population of rural Greece discovered a remarkable similarity to the nosology of the Hippocratic texts of the 5th century BC (see Blum and Blum, 1965). During the second half of the 20th century, however, there has been a revolution in the knowledge and treatment of diseases with regard to scientific advances and the development of effective drug therapies, vaccination, and surgical procedures, and, perhaps even more importantly, improved sanitation and access to health care – the provision of clean drinking water and the alleviation of poverty are the most effective weapons against disease.

One particular chronological and geographical continuity that links the Hellenic societies of the past to those of the present is that of hereditary disease. The medical writers of antiquity recognized that conditions such as epilepsy and strabismus could be passed down from parent to child, but there are two pathological conditions of particular interest, both of which can be traced back to ancient Greece and both of which

still affect the Greek population and Greek communities overseas: favism and thalassaemia.

Favism, or lathyrism, describes an acute haemolytic anaemia (the decomposition of red blood cells) which results when an individual suffering from a hereditary deficiency of the enzyme glucose-6-phosphate dehydrogenase (G6PD) eats fava beans (*Vicia faba*, or broad beans). The Mediterranean or beta minus variant of G6PD deficiency (which itself has many minor variants classified by region – Athens, Attica, Corinth, and so on) is prevalent in Greece, in areas of ancient Greek colonization, and in individuals of Greek descent throughout the world. The disease was not recognized in antiquity, although one Hippocratic treatise links a diet high in pulses to symptoms characteristic of the pathological reactivity which the defect can induce (*Epidemics* 2, ch. 4), and the current geographical distribution of G6PD deficiency, present in all of the oldest Greek settlements (more than 12 per cent in Athens, the Peloponnese, Epirus, and Thessaly and even higher in Cyprus and Rhodes), suggests that the defect was present in the population of archaic Greece.

Thalassaemia, another anaemia, compromises the production of haemoglobin; the predominant form of the defect in individuals of Greek descent is beta-A2. The thalassaemic trait is widespread on mainland Greece where 5–10 per cent of the population are carriers of the defective gene, while on the Ionian islands and Rhodes the figure rises to 14–16 per cent and on Cyprus reaches 16–20 per cent. Like G6PD deficiency, this defect too was present in the ancient Greek world (see Grmek, 1989, ch. 10, for a discussion of the evidence). In its minor form (when one parent of the affected individual is a carrier of the defective gene) the defect produces only a mild anaemia and there is usually no clinical disability. In its major form, however (when both parents are carriers), the disease has severe and frequently fatal effects – crippling anaemia, often followed by heart failure; a foetus with the major form of the disease can now be identified by DNA analysis and termination of the pregnancy may be advised.

Both G6PD deficiency and thalassaemia are serious and sometimes fatal diseases, yet the genetic defects that produced them have persisted in the Greek population from the very ancient past to the present. The explanation as to why such potentially damaging defects have continued through time lies in recent research that suggests that the common link between the diseases is the protection they afford against malaria: the G6PD defect provides increased resistance to malaria and indeed there is selection for a more severe trait if it provides greater protection, while the thalassaemic trait is most common in places where malaria was a particular problem in ancient Greece. The interrelationship between disease and its effect upon a population through time is a complex one; in this case the distribution of a contagious disease in Greek antiquity, malaria, together with the geographical, meteorological, and social environments that produced it, has affected the pattern of disease and even the genetic make-up of the Greek population three millennia later.

Dithyramb

The dithyramb was a choral song performed in honour of Dionysus. The original meaning of the word itself is obscure; the root *-amb* may be pre-Greek, but it nonetheless suggests a kinship with *iambos*, *thriambos*, and *ithumbos*, all terms for songs with early connections with Dionysus. Surviving evidence seems to indicate that the history of the genre can be divided into three phases: dithyramb as pre-literate cult song, the incorporation of choral dithyramb into formal competi-

tions in the 6th century BC, and the drastic renovation of the genre at the hands of the poets of the "new music" in the latter part of the 5th century.

Earliest evidence of the dithyramb comes from Archilochus of Paros in the 7th century BC. Although the passage in question does not itself appear to be dithyrambic, Archilochus speaks of knowing how "to lead off the dithyramb of lord Dionysus" when his "wits are thunderstruck with wine" (fr. 120 West²). Archilochus' use of the verb *exarchein* ("to lead off") finds a parallel in a number of early texts describing the formal conduct of communal songs such as the lament and wedding song (*Iliad*, 24. 723; *Odyssey*, 4. 15–19), and Archilochus himself also used it of the paean (fr. 121 West²). These passages suggest a kind of song in which a leader engages in exchanges with a chorus, although the precise nature of such songs and the kind of Dionysiac occasion in which the dithyramb was performed remain uncertain. Aristotle seemed to be thinking in similar terms when he recorded that tragedy originated "from those leading off the dithyramb", just as comedy arose from the leaders of the phallic song (*Poetics*, 1449a10). Similarly Proclus finds the origin of the dithyramb in "rustic play and festivities at drinking parties" (*Chrest.* 51 [320b21]). Aristotle also adds that drama came into being from an "improvisatory beginning", and this may be taken to indicate that early dithyrambs were not formal poetic compositions that were preserved in writing. In this light it is hazardous to make inferences concerning this period from the later dithyramb, especially since the genre underwent significant change in the 5th century BC. It is particularly important to note that the frequent assertion that the early dithyramb was a vehicle for myth, detailing the nature of Dionysus and his history, is not directly supported by the evidence, but is an uncertain inference drawn from later practice.

Herodotus records that Arion of Methymna "was the first man that we know of to compose a dithyramb and so name it and produce it in Corinth" (1. 23). This statement has aroused considerable controversy, especially concerning the precise implications of *onomasanta* ("having named it"). In light of the earlier evidence of Archilochus, it is very unlikely that Arion can have invented the genre itself. Accordingly, it has been plausibly suggested that Herodotus is referring to the formal introduction in Corinth of a choral song performed by a trained choir, to which the name "dithyramb" was given. The alternative view, that *onomasanta* means "entitled", has been widely held, but it unconvincingly pushes back into the 7th century BC the practice of applying titles to dithyrambs, a practice that is only securely attested for the 5th century BC.

Arion's activities in Corinth should be understood within the broader context of the initiatives of the early tyrants in numerous Greek cities, where local pride was fostered and civic ideology promoted through the establishment of poetic contests. Such contests were regularly part of religious festivals, and attracted competitors from across Greece. Little is known of the details of Arion's activity at Corinth, but it seems to have been well known to later practitioners of the genre. When Pindar asks in a victory ode composed for a Corinthian victor, "Whence came the delights of Dionysus with the ox-driving dithyramb?", the ancient commentators tell us that he is referring to Arion, and we can make the further inference that the dithyramb is called "ox-driving" (*boelatas*) because oxen were the prizes in the dithyrambic competition and they were sacrificed as part of the festival. There were no doubt strong similarities between such dithyrambic contests and the better-attested tragic competitions in Athens.

As is regularly the case, more is known about Athenian practice. Lasus of Hermione (b. 548/4 BC) is said to have established the dithyrambic competitions at Athens. We have some idea of the way in which the contests were organized: each of the ten Athenian tribes competed with one chorus of men and one of boys, and the size of these choruses was fixed at 50 in each case. As in the case of the dramatic competitions, a producer, called a *choregos*, presided over the performance, not only seeing to the equipping of the chorus, but also providing fees for the poet, the choral trainer (*chorodidaskalos*), and the accompanist, the *auletes*, who played the *aulos*, a double-reed instrument. There is evidence for dithyrambic performances at a number of Athenian festivals: the City Dionysia, Thargelia, Panathenaea, Prometheia, and the Hephaestia. Hypodicus of Chalcis, who is now little more than a name, was the first victor at the Dionysia in 509/8 BC, and this may imply that the dithyrambic competition postdated the formal institution of the tragic competitions, an event traditionally assigned to *c.*535 BC. The poets are never mentioned in inscriptions commemorating victories, and this suggests that the contests were a competition among the tribes, who commissioned dithyrambs from distinguished poets from around the Greek world. The victorious *choregos* typically set up in the Street of Tripods a tripod with a dedicatory inscription.

In the first part of the 5th century BC the most successful poets of the dithyramb were Simonides, Pindar, and Bacchylides. An anonymous epigram, usually dated to the Hellenistic period, mentions that Simonides won 56 victories in dithyrambic contests, but there is only a single mention among the ancient sources of a Simonidean dithyramb: Strabo (15. 3. 2) refers to a dithyramb entitled *Memnon*, which was part of Simonides' *Deliaca* (possibly poems composed for the Delians). Thanks largely to papyrus finds, we have a better impression of the poems by Pindar and Bacchylides collected together as dithyrambs by Alexandrian editors. The remains of Pindar's dithyrambs (frr. 70–88 Maehler) are noteworthy for the prominence of Dionysiac elements, and this suggests a conscious acknowledgement of the Dionysiac roots of the genre. As in the case of Pindar's victory odes, there are also passages that treat the occasion of the poem and the polis that commissioned it, as well as mythic narrative (including myths that do not appear to be connected with Dionysus). In sharp contrast to Pindar's dithyrambs, those by Bacchylides (15–20, possibly frr. 21–22 Maehler) betray no interest in Dionysiac myth or religion, nor do they appear to give any clear indication of the occasion for which they were intended; they are simply lyric narratives of a variety of myths. It is possible that Bacchylides' poems indicate the degree to which the dithyramb had moved away from its Dionysiac roots, but it is not at all certain that these poems are in fact dithyrambs. There is little firm evidence for the criteria employed by Alexandrian scholars for classifying such poems, and there is some suggestion that the situation was anything but clear, even when scholars were working with complete texts. A scholium (P.Oxy. 2368) preserves traces of an ancient dispute between Aristarchus and

Callimachus over the classification of the *Cassandra* (fr. 23 Maehler), and that debate has been echoed by modern scholars, especially concerning *Dith.* 17.

Many of the uncertainties concerning the nature and character of earlier dithyramb arise from the fact that in the latter half of the 5th century BC the dithyramb became a favourite vehicle for the musical experiments of the poets of the "new music". The comic poet Pherecrates provides a list of offences committed against Music by the leaders of the movement (fr. 155 *PCG*), among whom he names Cinesias, Melanippides, Timotheus, and Philoxenus. In particular, the *Persae* by Timotheus provides an extended example of "dithyrambic" style, although that poem is technically a *nomos*. A number of other extant passages give us a glimpse into the nature of a genre in which the traditional rigour of triadic structure has been replaced by astrophic form, and words have been subordinated to music. Accordingly, the emphasis seems very much to have been on the music, and there are reports of outrageous instrumental effects. Elaborate vocabulary and complicated imagery rendered the texts obscure to many, and these poets were much criticized on such grounds by later writers. In fact, the obscurity of dithyrambic poets became proverbial: "You make even less sense than a dithyramb", runs a proverb quoted by a scholiast to Aristophanes (*Birds*, 1393). This "dithyrambic style" was regularly pilloried by comic poets in the 4th century BC.

Dithyrambs continued to be performed in the post-Classical world. There is evidence for such performances on Delos in the Hellenistic period, at both the Delia and the Apollonia, and in Athens at the City Dionysia, at least until the 2nd century AD. The fragments from this period offer no firm basis for speculation, and it is tempting to suppose that activity of the poets of the "new music" so undermined the character of the dithyramb that the genre never fully recovered.

Divination

Divination, the supposed ability to acquire knowledge of the future or of other normally inaccessible matters by supernatural means, has always found a place in the Greek tradition from antiquity to the present day, but while some forms have enjoyed cultural approval, others have been condemned.

All the methods of divination in the Greek tradition, from the most sophisticated to the most crude, operate on the same basic principle: the belief that supernatural forces (whether gods, angels, demons, or spirits of the dead), endowed with greater understanding than humans, may reveal part of their superior knowledge through the phenomena being experienced or observed. Scholarship, following distinctions drawn in antiquity, has traditionally divided the methods of divination known in the Greek world between the "natural" or "intuitive" (those based simply upon direct inspiration in a natural or dream state) and the "artificial" or "inductive" (those involving deliberate observation, manipulation, and intervention on the part of the diviner). Such groupings, however, tend to be confusing since, even in the most apparently intuitive methods, some manipulation may be thought possible or necessary; they also impose a distinction not perceived by the great majority of actual participants, and have further been understood in different ways by different scholars. They are thus avoided here.

Oracular prophecy undoubtedly enjoyed the highest cultural esteem in the ancient Greek world. It was conducted at all manner of holy places, some of which transcended state boundaries and were highly institutionalized, although most were very local, catering to small communities and individuals. It also encompassed a broad spectrum of techniques, ranging from ecstatic utterance or frenzied behaviour to the interpretation of the rustling of leaves in a sacred tree or ripples in a sacred pool. The most famous site was probably Delphi, where Apollo was believed to speak through an inspired individual, the Pythia, but there were a number of other major oracles of similar standing, that of Zeus at Dodona for example. At these important centres a variety of complex rituals of consultation were conducted in correspondingly elaborate physical surroundings to produce the oracular response; questions were often posed by the representatives of cities and other such groups and concerned important matters of state policy and law, although individuals might also make enquiries. Another type of oracle, operating at a high cultural level and best exemplified by the tradition of Sibylline ecstatic prophecy, did not offer answers to specific questions but rather spoke generally about the future.

Closely related to oracular prophecy was the interpretation of dreams, which were taken to be inspired by supernatural powers. At some major sites, and at a great number of lesser ones, a god was believed to inspire the sick who slept there with dreams that either healed directly or told how a cure might be effected (incubation); most notable perhaps was the shrine of Asclepius at Epidaurus. People also commonly interpreted their own dreams as predictions of the future, or else they might employ professionals who had training and access to the many textbooks of dream interpretation (*oneirokritika*) that developed over the centuries and, in some cases, incorporated material from outside the Greek tradition. Dream interpretation illustrates quite clearly the problems of drawing sharp distinctions between "natural" and "artificial" forms of divination, for although it might appear to be a purely intuitive technique, in many cases there was an obvious perception that dreams might be *induced*, either in the self or another, and the powers producing them manipulated. Related to this notion, indeed, was a whole range of other divinatory techniques that

involved the inducement of inspiration. Thus in practices such as hydromancy, lekanomancy, and katoptromancy (where the behaviour of objects or substances in a vessel of water was observed or where, in more complex forms, a medium saw visions on the surface of water or some other shining or reflective material) it was believed that supernatural powers could be induced or forced by a diviner or sorcerer to reveal hidden knowledge; often these powers were thought to be the spirits of the dead and hence such techniques were perceived to be forms of necromancy.

Other common and highly developed methods of divination in the pre-Christian period include augury, in which the behaviour of birds was noted, and hieroscopy, in which the behaviour of sacrificial victims and, even more importantly, the formation, development, and marking of their various organs, such as the liver or shoulder blades, were observed. Also subject to interpretation were the chance utterances of people and involuntary movements of the body (such as twitching, sneezing, itching, and the like), as well as the patterns found on various parts of the body, like the palms (chiromancy). Natural signs were thought to predict coming weather, while heavenly events, from thunder and lightning to the appearance of comets and shooting stars, were believed to be very significant. From Hellenistic times the sometimes immensely complex and "scientific" technique of astrology developed under eastern influence; using observation of the regular and irregular movements of heavenly bodies, this either predicted the future or determined the most appropriate course and timing of action. Other simple, and consequently very common, techniques involved reading the pattern in which cast objects, such as dice, grain, knuckle bones, or other lots, fell, or the order in which they were extracted from a container. The point at which spinning objects stopped was believed to be revealing, for example of the identity of a thief, and significance might be derived from passages determined by some random method of selection in written texts.

With the rise of Christianity to dominance in the Greek world, the old officially sanctioned forms of divination ceased to be culturally acceptable; most had been formally banned by the 4th century AD and gradually fell into disuse. Oracular prophecy thus almost completely disappeared as a result of the Church's need to preserve the authority of its canon, despite having enjoyed some prominence in the form of directly inspired utterance in primitive Christianity and in some heretical sects; the various types of divination related to animal sacrifice also vanished along with the sacrificial rituals themselves. But although the new Christian orthodoxy claimed that all forms of pagan divination were evil and nothing but vehicles of demonic deceit, practice at the popular level dictated that some at least would continue relatively unchanged. In the public sphere incubation, for example, carried on without interruption, churches taking the place (sometimes quite literally) of pagan shrines and Christian holy figures substituting as the source of inspiration. There is also abundant evidence throughout Byzantine times and down to the modern period that very many of the more private and individual forms of divination continued to be practised, not only at the local level but sometimes even in such places as the imperial court.

It is thus clear that people in the Byzantine and early modern Greek world still engaged in the whole diverse range of minor divinatory techniques: taking note of unusual bodily sensations or markings on the skin, watching the behaviour of birds and animals, studying the patterns in which scattered barley, beans, bones, or stones would fall, extracting lots from jars of water (*klidonas*), and so forth. The use of icons for divination, for example by noting apparent changes in their colour, found acceptance due to their role in culturally approved Christian religious practice; the same is true of bibliomancy where random consultation of the Bible and particularly the Psalms was valued. Astrology also flourished and, indeed, was developed in intellectual circles, despite periodic bouts of condemnation, and the old techniques of dream interpretation, along with their manuals, continued to be employed at all levels of society: the emperor Manuel II Palaiologos is known to have had an interest in the subject and is even credited with a book on it. Also popular among professional diviners were versions of the ancient methods using a shining, reflective surface. In their more sophisticated forms these involved elaborate rituals of invocation and manipulation of spirits (usually thought to be evil) and perhaps the souls of the dead. Information was channelled through a child (hence virgin and pure) medium, and the ritual, which might involve considerable knowledge of complex astrological and cosmological theory as well as the deliberate manipulation of sense perception, usually took place within the confines of a magic circle.

Although it evidently continued almost unchanged into the early years of the 20th century, the serious practice of divination has diminished considerably since then, but some traditional forms still continue and these have been supplemented by methods imported from other cultures. Thus incubation regularly takes place at churches with a particular reputation for healing, and other dreams are analysed for what they may predict of the future; in some cases, rituals are performed, for example on the first Saturday in Lent, to induce dreams of a future spouse. Common rituals for determining affliction by the evil eye are often closely related to older types of divination involving oil and water (*lekanomandia*), while as recently as the 1970s more complex forms of this art were still being attributed to professional sorcerers thought capable of providing information about such things as lost objects or appropriate courses of action. Divination by icons continues and some memory of simple forms of augury persists. Another of the old practices still appearing in places is the *klidonas* ceremony in which personal objects are drawn from a jar of water, usually to predict marriage partners, while divination by means of the observation of markings on the shoulder blades of sheep (scapulomancy) is known from many regions, as is that which looks at the patterns made by dropped beans or grain. Closely related, and perhaps the most common of all modern practices, is reading the patterns made by the grounds in the bottom of coffee cups. Astrology, in the form of horoscopes, is found as widely in Greece as in any modern western country, while other types of divination that do not belong to the Greek tradition, such as tarot or playing-card reading, are also known.

The credibility and efficacy of divination were certainly accepted by most people in the ancient world and, although Christianity condemned it as implying a separate source of inspiration from that controlled and approved by the Church, it did little to challenge the underlying notion that information

could be obtained by such means, hence its persistence in the Greek tradition. This is not to say that there were no sceptics in antiquity or Byzantine times and some certainly preferred rational explanations to the supernatural ones usually offered for the operation of divination, or else dismissed most, if not all, such practices as the work of charlatans. The Church's constant criticism of divination during Byzantine and modern times has meant that ordinary people have often regarded it with some ambivalence, though this has often had more to do with the question of its sinfulness than its efficacy. Professional divination has tended to be viewed with particular suspicion, and even its practitioners have understood themselves to be working with evil powers, but minor types have been considered far less dangerous, especially by those unaffected by the niceties of theology. Thought to operate through the power of either neutral, natural forces, or else those of Christianity itself, such divination has been seen as a relatively legitimate activity. In recent times, however, as in most developed countries, all divination has increasingly come to be regarded with what has been described as a mixture of curiosity and mockery. Even among those who are still happy to engage in some of the rituals, the great majority are no longer prepared to accept the basis of belief in the supernatural required for their explanation. An example may be found in the practice of *klidonas*, deliberately revived by folklorists in some parts of Greece to preserve cultural heritage, or in the consultation of coffee cups or shoulder blades, prediction by which is not totally dismissed, but not taken particularly seriously by anyone either.

Divorce

Greek attitudes to divorce and the practicalities of its execution have undergone radical revision since antiquity and these revisions are revealing, reflecting as they do upon the changing roles of state and religion within the institution of marriage and indeed of the perceived nature and function of marriage itself. Evidence from Classical Athens suggests that divorce was common and simple to accomplish, requiring state authorization in only a few particular cases, a situation that mirrors the concept of marriage as an essentially private matter between individual families in which the state played no formal role. We possess less evidence for areas outside Athens, but the Gortyn law codes of Crete and the apparent flexibility of the marriage bond at Sparta suggest that divorce was easily obtainable throughout Greece.

At Athens there were, broadly, three categories of divorce, the defining characteristic of each being the agent who effected the separation. First, the husband could send his wife away (*apopempsis*), an action that required no justification and so was a potential area of insecurity for women. However, it is likely that such divorces were discouraged by social and family pressures and by the convention that demanded the return of the dowry to the wife's natal family in all cases of divorce, whatever the reason. There was however one circumstance in which the sending away of a wife was compulsory on pain of the loss of civil rights (*atimia*) for her husband, that of the wife's adultery (for an example, see Lysias, 14. 28).

Second, the wife could leave the marital home (*apoleipsis*). Plutarch claims that Hipparate, the wife of Alcibiades, registered her intention to divorce her errant husband with the archon (Plutarch, *Alcibiades*, 8), suggesting that Athenian women lacked the requisite authority to effect a divorce personally and so, unlike their husbands, required the ratification of the state. The evidence for wives initiating divorce is problematic, however, since no other text describes such an event, although Euripides, in the context of the possibility of a woman leaving an unhappy marriage, suggests that divorce brought women a bad reputation (*Medea*, 236–37), while the children of a marriage belonged to their father and remained in

his household, perhaps another disincentive for wives to seek divorce.

The third and perhaps most common category of divorce was that of *aphairesis*, the dissolution of marriage by the wife's natal guardian (*kyrios*). A woman's father and brothers had the right to insist upon her divorce and the return of her dowry, and the reasons that motivated them to do so highlight several functions of marriage in antiquity (and beyond). Childlessness is attested as a reason for divorce and the wife who did not provide her husband with heirs faced being sent back to her father's house. However, two lawcourt speeches voice a concern for the wives of infertile husbands; in one a husband unselfishly asks his wife's father to retrieve her and remarry her to another man so that she might have the chance to bear children (Isaeus, 2. 7–8), while in another a speaker criticizes the brother of a married but childless woman for not effecting her divorce and finding her another husband (Isaeus, 8. 36). The fate of the adulteress, compulsorily divorced, reflects too upon the notion that the primary purpose of marriage is the provision of legitimate children; the seduced woman can no longer be relied upon to fulfil this wifely function and so must be dismissed.

Marriage was important too as a site for social and interfamilial alliance, engendering and cementing kinship ties between and within families. Conversely, when conflict arose, divorce could result (Demosthenes, 4. 4), while social and financial ambition could also lead to the dissolution of an unprofitable marriage; in one text a daughter begs her father not to divorce her from the husband she loves to marry her to a richer man (Menander, Papyrus Didot 1). The case of the *epikliros* is particularly instructive here. The estate of a man who died without sons could be claimed by his nearest male kin, who was constrained also to marry any daughter of the deceased, the *epikliros*, who thus pertained to the estate. Such claims were legally adjudicated in a special court hearing (*epidikasia*). Significantly, a married woman who became an *epikliros* was divorced from her present husband in the interests of inheritance and the production of legitimate heirs for her natal family and thus, as the speaker in a 4th-century BC court case insists, "many men are deprived of their wives" (Isaeus, 3. 64).

Such pragmatic concerns about the legitimacy of children and socio-economic factors continued to inform marital alliance and separation in the Hellenic world, but the new perspective on marriage introduced by Christian teaching produced a pronounced change in attitudes to divorce. While the early Church's view on wedlock was divided, on the whole it promulgated the sanctity of marriage which thus was accorded an extra religious dimension and status. Furthermore, in marked contrast to the easily dissoluble marriage ties of antiquity, Christian marriage was regarded as a bond for life, and divorce was thus anathema. A further disincentive to divorce lay in the Christian notion that remarriage constituted adultery, even in the case of widowhood and especially with regard to divorce.

Today, while Orthodoxy regards marriage as a holy sacrament, the Church does permit divorce, although theoretically Orthodox canon law allows divorce and remarriage only in cases of the wife's unchastity, referring to the authority of Matthew 19: 9, an interesting parallel to the law of Classical Athens. In practice, however, the Church may make exceptions and will allow divorce for other reasons. Divorce ratified by the state may be easily obtainable in Greece and for the many Hellenic communities overseas, but for remarriage within the Church a divorce granted by the state is insufficient.

Dodecanese

Aegean islands

Today the "Dodecanese" (literally "group of 12 islands") includes Astypalia, Chalki, Cos, Kalymnos, Karpathos, Kasos, Kastellorizo, Leros, Leipsoi, Nisyros, Patmos, Rhodes, Symi, and Tilos, as well as a few other small islands, one or two of which are inhabited but do not have independent (deme) status. That is a total of 14 islands. The original 12, which included Ikaria but excluded Rhodes and Cos, got their group status following a collective protest in 1908 at the proposed removal of privileges which they had enjoyed from the

Dodecanese: view from Rhodes, the largest island of the group of 14

Ottoman authorities since the 16th century. These were taxation at a modest level and by community not by individual, and freedom from the permanent presence of Ottoman officials. The very importance of Rhodes and Cos was of course the reason why they were, from the start, excluded from privileged status. In fact the term "Dodecanese" was used as early as the 12th century AD but in a quite different sense. In this article it is used with the meaning it bears today.

Although the Dodecanese are geologically, and in details of climate and fauna and flora, more closely related to continental Asia Minor than to the Aegean archipelago, and in early prehistory were close in culture to Asia Minor, from the time of the Minoan palaces (*c.*2000 BC) they were part of Aegean spheres of influence (which included coastal Anatolia).

Both Minoan and Mycenaean remains have been found widely in these islands and it is clear that the Dodecanese belonged, in succession, to these cultural areas. Their history in the early Iron Age and down to *c.*600 BC is not known in much detail but they certainly received settlers from various parts of Greece and acquired their Dorian character. The islands (especially the three cities of Rhodes – Ialysus, Camirus and Lindus) were prosperous in the Archaic period (6th century BC) and the Rhodians participated in the establishment of the Greek trading emporium of Naucratis on the Nile delta and founded colonies abroad, contributing substantially to the spread of Greek culture. In the Persian Wars of the early 5th century BC, the colonies were squeezed between the opposing sides, not least because of their geographical position. In the Classical period there were synoecisms, accompanied by the foundation of new urban centres, on both Rhodes and Cos. The smaller islands were subordinate to them and were sometimes formally incorporated into their administrative structure. Rhodes and Cos were especially prosperous and important artistic centres in the Hellenistic period, when they were subject to the Ptolemies of Egypt. Rhodian sculptors were responsible, inter alia, for the works in the Cave of Tiberius at Sperlonga in Italy, and played an important part in the transmission of Greek stylistic influences on Roman sculpture. After the advent of the Romans, Rhodes was punished for its support of the anti-Roman Macedonian king Perseus, and lost its economic and maritime influence when Delos was made a free port in AD 166.

When Constantinople became the capital of the Christianized Roman empire in AD 330, geography again determined the allegiance of the Dodecanese as is clear from the remains of numerous early Christian basilicas in the islands. In the 7th and 8th centuries AD they were plagued by Arab raiders, who may even have established a base on Karpathos (Sokastro). Under Byzantine administration the islands later belonged to the themes of Cibyra and the Aegean Sea. The

monastery of St John on Patmos was founded in 1088 and other ecclesiastical architecture reflects the islands' prosperity in the Middle Byzantine period (843–1204).

In the 11th and 12th centuries, with the advent of the Crusaders, and of Genoese and Venetian traders, contacts were established with the west which were to be so important in the history of the Dodecanese. In 1309 Rhodes was captured by the Hospitaller Knights of St John who had been expelled from the Holy Land (and later from Cyprus). The knights, who remained until 1523, rapidly established control over most of the Dodecanese. During their ascendancy local culture was maintained, most effectively by the Church, but material culture was somewhat diluted by the introduction of western elements in art and architecture.

In the 14th and 15th centuries many of the islands were attacked by the Ottomans and in 1523 the knights were expelled from Rhodes after a long siege. This event inaugurated nearly 400 years of subjection to Ottoman Turkey. Although the smaller islands were largely untouched by the Ottomans, Rhodes and Cos were much more closely controlled – a fact which is substantiated by their architectural history. Only on those islands are there widespread signs of Ottoman presence, with purpose-built mosques, schools, bath houses, etc., as well as churches converted for Muslim worship. Nevertheless the two communities were not integrated: no Greeks, for instance, were permitted to reside within the walled old town of Rhodes; churches in Byzantine style continued to be built and decorated in traditional fashion and Greek customs were maintained. The problems of 1908 are however symptomatic of greater interference by the Ottoman authorities in the 19th century.

The islanders took part in the wars of independence, with notable contributions from the sailors of Kasos and the shipbuilders of Symi but, although they were originally assigned to the new Greek kingdom of 1833, they were subsequently exchanged for Euboea, which was initially to go to Turkey.

Italy took the Dodecanese in 1912 in the Italo-Turkish war. Under the first and second Treaties of Lausanne the islands were first destined for Turkey, then Italian possession was confirmed (1924). This situation lasted until 1947. In the years before World War II strenuous attempts were made to impose Italian language and culture, leading to riots and bloodshed, especially on Kalymnos. Under the Italians there was a governor in Rhodes and a regent on Cos. In both these towns, and on Leros where there was an important naval base, the grandiose public buildings of the period are strikingly un-Greek. There are occasional examples too on other islands (the police station on Patmos). The architecture of the Greek churches was not affected, however, that of private houses only occasionally and in minor details.

During the war the Germans took over some of the islands which later came under British military administration. The German surrender of the Dodecanese was signed on Symi on 8 May 1945.

Although there was considerable emigration from the Dodecanese in the 19th century, the islands mostly maintained substantial populations (Kasos – only 1100 today – had 11,000 until 1824, when it was ravaged by Egyptians) up to the Italian period when their main industry (sponge fishing) was hard hit by a ban on working off the coast of North Africa, which was exploited by other Italian colonies. One result of the subsequent emigration was the Dodecanesian colony of sponge fishers at Tarpon Springs in Florida.

Three points should be emphasized in considering the contribution of the Dodecanese to the Greek tradition. First, the three periods of substantial foreign interference introduced some significant non-Greek elements into local culture, but these were material rather than spiritual. Secondly, while these elements may superficially have enriched that culture, they have done nothing to affect its essential Greekness (and close affinity with the rest of the Aegean) which was energetically maintained. Thirdly, both in antiquity and in more recent times, Dodecanesian emigrants have played an important part in establishing Greek culture in other parts of the world. In recent times this has helped maintain the viability of small local communities by remittances.

R.L.N. BARBER

Summary

Group of "12" (now redefined to include 14) islands in the southeast Aegean. Rhodes and Cos became especially prosperous during the Hellenistic period. The 11th and 12th centuries brought contact with crusaders and traders from the west, and from 1309 to 1523 Rhodes was held by the Hospitaller Knights of St John. After four centuries of Ottoman rule, the islands became Italian from 1924 to 1947. Their Greek culture was however maintained throughout.

Dodona

City in Epirus

Dodona was the site of reputedly the oldest oracle in ancient Greece and dedicated to the worship of Zeus. Located at the head of the valley of Tsarkopvitsa at the foot of Mount Tomaros, the ancient site is 22 km south of Ioannina. In Classical times pilgrims reached the site from the south, up the valley of the river Louros to the town of Kopani. In Roman times Dodona lay directly on the inner main Epirote road heading north from Nicopolis; its centrality explains the revival in the 2nd century AD of the Zeus Naia festival and games and the establishment of a bisphoric two centuries later.

In the 3rd millennium BC Dodona saw continuous habitation in the form of primitive shepherd communities. No build-

Dodona: view of the theatre, built in the 3rd century BC to seat 18,000 spectators

ings survive from this period, although numerous stone tools, loom weights, pottery, and a clay hearth have been found. Seasonal habitation is suggested, that is, shepherds brought their herds to Dodona each summer to take advantage of the pastures, springs, forests, and cool temperatures. These non-Greek-speaking shepherds are identified in Greek tradition as Pelasgians. At the end of the Early Bronze Age or shortly thereafter, Greek-speaking peoples moved into the area, perhaps bringing with them the worship of Zeus. (Some scholars hypothesize that an original cult to the mother-earth goddess, Gaia, was supplanted by Zeus' cult; Gaia then became Zeus' consort, only to be replaced ultimately by Dione Naia, who is known from numismatic and inscriptional evidence to have shared the sanctuary with Zeus in the historical period.)

Dodona appears in both the *Iliad* and the *Odyssey*. In the *Iliad* (16. 233ff.) Achilles mentions priests called Selloi who had unwashed feet, slept on the ground, and acted as interpreters of Zeus; some scholars explain the unparalleled behaviour of unwashed feet and sleeping on the ground as indicative of an earlier Gaia cult, wherein priests strove to stay in communication with mother earth. Odysseus (*Odyssey*, 14. 327–28) travelled to Dodona to hear the will of Zeus uttered from a sacred oak tree. It is not clear from the text whether Zeus spoke from the oak, the oak itself spoke, or the priests interpreted the rustling of the oak's leaves or the moving of its branches. Hesiod (fr. 240, 319M-W) goes further, stating that Zeus spoke through doves within the oak; this may refer to the birds' cries or to their flight. Herodotus (2. 55) mentions the presence of three priestesses, whom he calls "doves"; his silence on the Selloi suggests that the male priests of Homer had been supplanted by priestesses sometime during the Archaic period. Scholars explain the move to priestesses as Dodona's attempt to emulate the oracular practices at the more famous sanctuary of Delphi. Whatever the reason for the change, the priestesses now assumed charge of the oracle, which had come to consist of consultation by lots. (Plato's assertion in the *Phaedrus* that the priestesses underwent ecstatic trances is a fantasy.) The use of lots would be logical if the sacred oak tree, which by now would have been 600 years old, had begun to die; moreover, the oracle at Delphi occasionally resorted to the use of lots, and so Dodona may have copied that practice.

The method of consultation was quite simple. The enquirer wrote his query onto a ribbon strip of lead and folded it over three or four times. The folded lead was marked on the outside for identification purposes and placed in a jar. A priestess then pulled from the jar an enquiry at the very time that she drew from another jar one of several responses, either a "yes" or "no" answer or the name of a deity to whom proper sacrifices needed to be made. These responses may have been written on oaken tablets (thereby perpetuating the tradition of the prophetic oak), although the use of other materials such as beans cannot be precluded. Over 150 enquiries have been discovered, the majority now housed in the Ioannina Museum. Only a few enquiries dealt with state affairs; the rest came from private individuals, most of them local, who wanted to receive foreknowledge about such matters as marriage, children, health, and employment. The lead tablets date from 500 to about 250 BC, when the oracle fell into disuse.

The city of Dodona flourished even after the oracle declined. Pyrrhus, king of Epirus, made it the religious centre of his kingdom and transferred there the mint of the Epirote alliance. With the subsequent establishment of the festival of Zeus Naia honouring the god, Dodona saw its first major building programme. Previously the site had consisted of only a small, early 4th-century temple to Zeus, a stone circuit wall that enclosed the temple and sacred oak, and a temple of Dione; in as much as the oracular cult required no elaborate structures (other than a few tables, jars, and consulting area), the sparse remains are wholly expected. During Pyrrhus' reign, the temple of Zeus was enlarged, two temples (to Heracles and to Aphrodite) were constructed, and a vast theatre was built on the hillside. The theatre's large seating capacity (up to 20,000) can be explained only by its connection with the Naia festival. The city was also fortified by an extensive circuit wall, with towers on three of its sides. The city proper, located on the acropolis north of the theatre, is mostly unexcavated. In 219 BC the Aetolians, under the generalship of Dorimachus, invaded Epirus and ravaged the site. The site was immediately restored by Philip V, king of Macedon. The temple of Zeus was further enlarged; also erected were a new temple of Dione and, in conjunction with the festival of the Naia, a council house, guesthouse, and a stadium to the southwest of the theatre. The oracle had by now fallen silent, as evidenced by the dearth of votive offerings and enquiry tablets. In 167 BC the Romans under Aemilius Paullus sacked Dodona to punish the Epirotes who had assisted the Macedonian king Perseus in his revolt. Dodona never recovered from this destruction. A ravaging in 88 BC by troops of Mithradates VI, king of Pontus, only exacerbated the situation. The Naia did continue on, however, until at least the mid-3rd century AD. The oracle remained silent, although Roman and Christian Greek writers penned fanciful descriptions of mantic activities like the banging of bronze cauldrons or gongs and the presence of oracular springs. The Naia ceased with the establishment of Christianity. A Byzantine basilica was built in the sanctuary in around 400, and the Council of Ephesus (431) records a bishop from Dodona in attendance.

Summary

City in Epirus, site of the oldest oracle in Greece, dedicated to Zeus. Ritual is described by Homer, Hesiod, and Herodotus. Enquiries were later written on strips of lead, of which some 150 are preserved, dating from c.500 to 250 BC when the oracle fell into disuse. There are remains of various other buildings including a vast theatre used for the celebration of the Zeus Naia festival.

Dorians

Ancient ethnic group

The ancient Greeks believed that the Hellenic people was constituted by the totality of various ethnic subgroups, of whom the Dorians (along with the Ionians, Aeolians, and Achaeans) were considered to be the most important. By the Classical period, various cities in the Peloponnese (Sparta, Argos, Corinth, Sicyon, Megara), Crete and the southern Cyclades (Melos, Thera), the Dodecanese (Rhodes, Cos), southwest Asia Minor (Cnidus, Halicarnassus), North Africa (Cyrene), Sicily (Syracuse, Megara Hyblaea, Gela), and south Italy (Tarentum) claimed that they were Dorian foundations on the basis of perceived similarities in dialect, rituals, customs, and common origins.

According to ancient authors the Dorians had originally lived in central and northern Greece but had, towards the end of the heroic age, migrated south to the Peloponnese in the company of the Heraclidae (descendants of Heracles); a second migratory wave carried Dorians across the southern Aegean to Asia Minor, while the period of colonization from the 8th century BC onwards resulted in the Dorian foundations in Italy, Sicily, and Libya. The tradition for the so-called "Dorian invasion" of the Peloponnese is most fully attested in the universal history of Diodorus Siculus (1st century BC) and in the early imperial work known as the *Library* which was erroneously ascribed to Apollodorus of Athens. There are, however, earlier references: in the 5th century BC Herodotus (9. 26) mentions the first (unsuccessful) assault on the Peloponnese by the Heraclidae and Thucydides (1. 12) notes the second (successful) invasion by the Dorians and Heraclidae – an event which he places 80 years after the sack of Troy – while the 7th-century BC Spartan poet Tyrtaeus (fr. 2) proclaims that Sparta was granted by Zeus and Hera "to the Heraclidae, with whom we [Dorians] left windy Erineus and arrived in the broad island of Pelops". Despite the fact that his subject matter ostensibly deals with the premigratory phase of the heroic age, Homer (*Odyssey*, 19. 177) remarks on the presence of Dorians in Crete, alongside Achaeans, Eteocretans, Cydonians, and Pelasgians.

Although attempts were made in the 19th century to find archaeological confirmation for the Dorian invasion in the destructions of the Mycenaean palaces, it is now generally believed that the collapse of the palatial system was due to natural disaster, internal conflict, or economic failure rather than to external enemy action. Furthermore, apparent innovations in cultural forms and artifacts that were once attributed to the arrival of the Dorians (e.g. iron working, protogeometric pottery, cremation, burial in cist tombs, and new types of weapons and jewellery) have proved to be either earlier than the palatial destructions or first attested in areas such as Attica and Euboea which did not claim to be Dorian.

Similar scepticism concerning the tradition has recently been expressed by linguists who note that while the "Doric" dialects spoken in various cities share certain structural correspondences, no single linguistic innovation can be isolated that is not also found in at least one other non-Doric dialect and that therefore the Doric dialects need not derive from one proto-Doric idiom once spoken in central or northern Greece. In addition some Dorian cities seem not to have used the Doric dialect: by the 5th century BC, Halicarnassus was apparently employing the Ionic dialect for its official inscriptions.

Thucydides (6. 4. 3; 6. 5. 1) implies the existence of recognizably Dorian customs, though these are not explicitly identified. They may have concerned issues of constitution, law, political subdivision into the three "Doric" tribes of the Hylleis, Dymanes, and Pamphyloi, calendars, and religious festivals (for example, the festival of the Carnea), but it is far from clear that such customs were universal to all Dorian cities. Similarly, despite its origins in Corinthia, there is no reason to regard the "Doric" order of architecture as exclusively Dorian; the same is true of the "Doric" mode in music. Finally, various versions of the tradition appear to attribute to the Dorians different ancestors (Dorus, Aegimius) and different primordial homelands (Doris, Hestiaeotis, Thessaly, Macedonia) which might suggest that the legend of the Dorian invasion was in fact a compilation of earlier traditions that evolved towards the end of the Dark Age.

The earliest mobilization of Dorian identity for extrapolitical purposes would appear to be the Dorian Hexapolis—a league which, according to Herodotus (1. 144), was centred on the sanctuary of Apollo Triopios on the Cnidian promontory and which included the Rhodian cities of Lindus, Ialysus and Camirus together with Cos, Cnidus, and Halicarnassus (later expelled). If, as seems likely, the league was a Dorian response to the Ionian Dodecapolis (centred on the Panionion at Cape Mycale), then its origins should date back to at least the beginning of the 6th century BC. By contrast, Herodotus' account of Cleisthenes of Sicyon (5. 67–68) seems to imply that appeals to Dorian ancestry in the Peloponnese may have been restricted to the ruling elites.

In the 5th century BC appeals to a collective Dorian identity became more frequent in mainland Greece, particularly at Sparta whose evocation of Dorian kinship served to justify its intervention in the central Greek region of Doris in 457 BC (Thucydides 1. 107). The exploitation of Dorian solidarity reached its apogee, however, in the course of the Peloponnesian War as Sparta employed the motif of common kinship with its Peloponnesian and Sicilian allies in opposition to Athenian appeals to an Ionian heritage: on several occasions, Thucydides has his Spartan or Syracusan speakers contrast the freedom and courage of the Dorians with the enfeebled slavishness of Athens' Ionian allies (e.g. 5. 9; 6. 77).

From the 4th century BC onwards fewer appeals were made on the basis of Dorian identity, although renewed interest in Dorian origins accompanied the emperor Hadrian's foundation of the Panhellenion in AD 131/32 when adduced proof of being a Dorian foundation was frequently the prerequisite for admission into the league (both Cyrene and Synnada in Phrygia guaranteed their admission by these means). In the same period, Sparta attempted to revitalize its prestige by capitalizing upon its earlier status as an archetypal Dorian city and reviving its ancient customs in an archaizing form (including a "hyperdoricization" of its dialect). In general, however, the ethnic, cultural, and religious connotations of the term "Dorian" became gradually less significant compared with the linguistic definition as grammarians sought to identify a literary Doric dialect (alongside Attic, Ionic, and Aeolic) on the basis of the Doric idiom employed by earlier poets such as Tyrtaeus, Alcman, and Pindar. While the Dorians have figured prominently in the historiography and ideology of western Europe (particularly among German romantics of the 19th century and later the Nazi party), their role within the Hellenic tradition has been less significant, although it is often claimed that the modern dialect of Tsakonian (spoken in the northern Parnon range of the eastern Peloponnese) attests linguistic archaisms that find parallels with the ancient Doric dialect of Laconia.

Summary

One of the main ancient ethnic groups of the southern Balkans, thought in antiquity to have moved south into the Peloponnese at the end of the heroic age (*c.*1200 BC) and then on into the south Aegean and Asia Minor. There is no archaeological or linguistic evidence to support this; but Dorians felt a shared racial identity in the Classical period which was often exploited for political purposes, especially by Sparta.

Doukas family

Doukas, or Doux, probably a Hellenized form of the Latin military rank *dux*, occurs as a family name in Byzantium from the mid-9th century onwards. Bearers of the name eventually became widespread at all levels of Byzantine society from the emperor downwards, but not all seem to have belonged to the same family or clan (unlike the Komnenoi, for instance). Origins in Armenia have been suggested for some Doukai, but this is unprovable and rather unlikely. In his history (written before 1138) Nikephoros Bryennios claims for the first Doukas an anachronistic rank and relationship with Constantine the Great, saying that he had been appointed Dux of Constantinople by Constantine. The 11th-century imperial Doukai seem to have had connections with Paphlagonia, perhaps the seat of the family estates and the source of their wealth.

Three groups of Doukai can be distinguished in the period before 1204. Around 855 a "son of Doux" was involved in the persecution of the heretical Paulicians. Some 50 years later, and possibly related to this Doux, there appear Andronikos Doux (d. *c.*908), his son Constantine (d. 913), and Constantine's three sons, military commanders who were successful against the Arabs in Asia Minor. Andronikos was drawn into rebellion, defected to Islam, and died in obscurity. Constantine, apparently a charismatic personality, was reinstated in his military position and became involved unsuccessfully in schemes to make him co-emperor and guardian of the young Constantine VII Andronikos and Constantine became the subject of legend.

The second group, Andronikos Doux Lydos (d. *c.*979) and his two sons, probably unrelated to the earlier Doukai, were prominent under Basil II and were involved in the revolt of Bardas Skleros and the magnates of Asia Minor.

The third group, again probably unrelated to the above, are the Doukai who became emperors and high imperial officials in the late 11th century, emerging from among rival aristocratic clans in the confused years following the demise of the Macedonian dynasty. Constantine X Doukas (emperor 1059–67), a representative of the civil administration rather than the military, owed his promotion as emperor to a network of court contacts. He was marked more by piety, restraint, and financial prudence than incisive activity. His sole military venture, against the invading Uzes in 1064–65, was an abject failure. During his reign little attempt was made to respond to the increasing Turkic penetration into Asia Minor. On his

death the military party put forward the general Romanos Diogenes, whose imperial status (as Romanos IV Diogenes, 1068–71) was legitimized by marriage to the widow of Constantine X, Eudokia Makrembolitissa. When Romanos fell into Turkish hands following the battle of Manzikert (1071), Constantine's son Michael was proclaimed emperor as Michael VII Doukas (emperor 1071–78; d. *c.*1090). A pupil of the statesman-philosopher Psellos, Michael was an unsatisfactory personality, perhaps simple-minded, with little taste for the military activity which circumstances demanded. Partly as a result of the Turkish devastation of Asia Minor, Byzantine coinage was seriously devalued during his reign; his nickname, Parapinakes, derives from the diminution of corn measures by the fraction known as a *pinakion*. He was eventually deposed in favour of the general Nikephoros Botaneiates and lived out his last days as a monk. Lively biographies of both Constantine and Michael are to be found in Psellos' *Chronographia*.

During and after the reign of Constantine, Michael's brother John (d. 1088), known as the Caesar John, played a prominent role both as a military commander and a schemer. Having engineered the disastrous retreat at Manzikert and the subsequent blinding of Romanos IV, he was instrumental in ensuring the eventual succession of Michael VII, his nephew. He became involved in the subsequent jockeying for power between the Doukas and Komnenos families, ultimately falling from his nephew's favour and becoming an adherent of the Komnenos faction. He set up a marriage between his granddaughter Irene and the rising young Alexios Komnenos, later emperor Alexios I. Like his brother and nephew, he seems to have exerted influence more as a result of his social position and wealth than through force of personality.

Of the numerous Doukas progeny, who formed a dense network of marriage alliances with other aristocratic families, the last with a serious chance of becoming emperor was Constantine (d. after 1094), the son of Michael VII. Though deprived of his right of succession on his father's fall from power, he was in 1083 betrothed to Anna Komnene, the eldest child of Alexios I and the future historian. Until the birth of John Komnenos in 1087, Constantine was acclaimed with Anna as future ruler.

Irene Doukaina, granddaughter of the Caesar John and wife of Alexios I Komnenos, united the two major aristocratic clans of the late 11th century and, by giving birth to seven children, themselves all with numerous offspring, did much to ensure the dynastic dominance of this family grouping. Accepted at first only with reluctance by Alexios, she came to be a valued and influential counsellor. She played an important cultural role as the patroness of such writers as her son-in-law Nikephoros Bryennios and the poet-scholar Theodore Prodromos. She endowed a monastery, of Our Lady Full of Grace, whose foundation document survives as an invaluable source of information on monastic practices as well as the prosopography of her family.

From the mid-12th century onwards the Doukas family became inextricably intermingled with other aristocratic groupings and the name Doukas appears increasingly only in combined form, such as Komneno-Doukas, attached to other families (such as Kamateros or Vatatzes), or in strings such as Michael Doukas Angelos Komnenos Palaiologos (Michael VIII, died 1282).

Later prominent bearers of the name include the historian Doukas (*c.*1400– after 1462), who recounted the last days of Byzantine rule in Constantinople. In the service of the Genoese Gattilusio family in Lesbos, he was an eyewitness to many of the events that he described. He supported the union of the Orthodox Church with Rome and viewed the Turkish conquest as God's punishment for Byzantine sins, though he was under no illusions about Turkish cruelty.

Such was the fame of the 10th-century Doukai that it would seem that reflections of their deeds have lingered on in stories and songs that have influenced the epic-romance *Digenis Akritis*. The personal roles of both Constantine and Andronikos are discernible in the epic, and especially in more recent Akritic songs, while the name of Doukas itself is part of the family background of both the hero Digenis and his bride.

Dowry

The institution of dowry (*proix*) has been a significant feature of marriage within the Hellenic world from antiquity until well into the 20th century as a material marker of both socio-economic status and interfamilial alliance; and, while the abolition of the dowry system was part of a relatively recent parcel of legal reforms relating to marriage and the family in Greece (Family Law Act 1983), there is evidence to suggest that the practice persists, in rural areas at least (see Kourvetaris and Dobratz, 1987).

In antiquity, dowry in the form of money, goods, livestock, or land represented the bride's family's contribution towards the establishment of the new household and, while not legally obligatory, was a normal and expected element of prenuptial negotiations, fixed at the time of betrothal. Indeed, since marriage was a private matter between individuals, the provision of a dowry was one indication that a sexual relationship was equivalent to marriage (Isaeus, 3. 78). Dowry was an important expression of social standing and wealth; at Athens in the Classical period dowries for women from rich families

could amount to 5–10 per cent of the paternal estate, while for poorer families the proportion of the family property may have been greater still. Dowering the females of the family could represent an onerous financial burden, especially where there were many daughters, and the system may have contributed to the ancient practice of selective female infanticide (Golden, 1981, suggests a 10 per cent rate of female infanticide for Classical Athens). Nevertheless, particularly where women had little if any financial and legal power, dowry was an arrangement that worked to protect women's interests within marriage and to maintain links with their natal families; as such, it must be distinguished from the giving of "bridewealth" where the groom pays money to the bride's family.

Athenian women did not themselves take possession of their dowries; dowry was given by the bride's guardian (*kyrios*, usually her father or brother) to her husband and he administered it, dowry being essentially a transfer of property from *kyrios* to *kyrios*. Yet this transfer was, crucially, conditional; the husband's control of the dowry depended upon his continuing control and support of his wife and, if the marriage failed, the dowry was returned to the woman's original *kyrios*. The return of dowry on divorce was compulsory, including those cases when the wife's natal family instigated the separation and even when divorce was enforced legally upon a husband by his wife's adultery. Failure to return dowered property constrained the husband to pay interest on the original amount at a rate of 18 per cent per annum and failure to do this could result in a legal prosecution. In the case of large dowries, a mortgage (*apotimima*) equivalent to the value of the dowry was a common prerequisite to ensure repayment in the event of divorce. The destination of the dowry in the event of the death of either spouse depended upon the existence of children: if the wife died childless, her dowry was returned to her father; if the husband died childless, his widow was returned together with her dowry which could be used to redower her for a second marriage. If there were sons, however, they inherited their mother's portion (*metroia*) when they reached the age of majority, yet were obliged to maintain her for life.

A returnable dowry had several important implications. First, it reduced the likelihood of husbands divorcing their wives for trivial reasons and perhaps provided them with a financial incentive to treat their wives well; several texts attest to the power over her man that a large dowry could confer upon a wife through the threat of divorce (Menander, fr. 333 Koerte; Plato, *Laws*, 774c–e). Second, a widowed or divorced woman could return to her father's house with her dowry as a means of support, while the same property in the form of a second dowry could provide an opportunity for remarriage, a frequent occurrence in antiquity. Indeed, the role of the dowry system in the protection of women's interests in marriage is recognized by a legal speech from 4th-century BC Athens which suggests that the rich man who marries a poor girl ought to provide a fictitious dowry that he would be obliged to return in the case of divorce (Isaeus, 3. 35–36). Thus in a society such as Athens, where women did not inherit, dowry can be seen as a daughter's share in the household patrimony, the counterpart of (although not equivalent to) a son's inheritance and, as a form of security, a maintenance fund that attached to a woman throughout her life and which her sons would inherit.

In later Hellenic societies dowry retained its importance within the marriage contract, yet its uses underwent subtle changes. Where women exercised greater financial control, they are found disposing of and bequeathing their dowries in the form of a maternal inheritance, for example, in Hellenistic Egypt, where a daughter's dowry could equal a son's inheritance and could be provided by mothers as well as fathers, taking the form of money and personal property, although not of land. One Alexandrian marriage contract from 92 BC in which the dowry settlement is the crucial component insists that, if the wife voluntarily leaves the marriage, her husband must return her dowry within ten days and, failing this, must forfeit the amount plus one half (Tebtunis Papyrus 104). In the Byzantine period bridegrooms contributed an amount equal to that specified in the bride's dowry contract (*proikosymbolia*) and, while husbands administered the marital funds, the alienation of their wives' dowries was subject to considerable legal restrictions.

Christianity provided a new role for dowry as a means of financial support for women wishing to embrace monasticism – a woman was expected to bring money to the Church, just as she would on marriage. While often a father's approbation was required (and denied), an 11th-century ruling decreed that married women wishing to enter convents were allowed a six-month trial period, after which they were granted their dowries (Peira, 25. 4).

Well into the late 20th century Greek families have worked to finance sons' educations and daughters' dowries and the provision of dowry has been often a joint enterprise to which the whole family contributed, the strength of the obligation being such that Greek emigrants commonly sent home money to dower their daughters, sisters, and nieces. Yet this very Hellenic institution which has persisted from antiquity to the very recent past has now largely disappeared from Greece, a development informed by the radically changing role of women in the second half of the 20th century. Education and a career are now the concerns of girls as well as boys; married women contribute financially to their households and do not need a maintenance fund for their support. Furthermore, women no longer need to receive their share of patrimony in the form of dowry since they can inherit directly. Significantly, the abolition of the dowry system in 1983 was part of a reform package designed to encourage and recognize female equality and is a reflection of the enhanced social, legal, and economic status of women in modern Greek society.

Doxiadis, Constantinos Apostolou

1913–1975

Architect and planner

Constantinos Doxiadis was an architect and planner who played a central role in the reconstruction and development of Greece after World War II. During the 1950s and 1960s his theory, teaching, and practice resonated beyond the architectural culture of Greece, and constituted a primary reference on development around the world.

Doxiadis was born in Stenimachos, in Bulgaria, and grew up in Athens. He received a degree in architecture and engineering from the National Metsovion Technical University of Athens (1935) and a Ph.D. in planning from the Berlin-Charlottenburg University (1936). His dissertation contended that the seemingly disordered layout of ancient Greek religious communities was derived from angles of vision, radial distances, and mathematical and philosophical principles of human cognition. Originally published in German in 1937 and soon translated into Greek, this first major study by Doxiadis was highly acclaimed for its originality, but some architects and archaeologists in Greece criticized its rationalist leanings.

Doxiadis began his professional career in 1937 as a chief town planner for Greater Athens. In 1939 he became chief of the Department of Regional and Town Planning in the Ministry of Public Works, where he was instrumental in promoting research for large-scale regional planning. When Greece entered World War II in 1940, Doxiadis was sent to the Albanian front, where he was decorated for bravery. During the Nazi occupation of Greece, he returned to his job at the Ministry of Public Works and coordinated a team effort to evaluate war damage in Greece looking towards future reconstruction; at the same time, he joined the resistance and led a team which gathered information on military objectives and passed it along to the Allies. This direct exposure to the devastation of the war intensified his position that the problems of shelter in Greek towns and villages called for an all-encompassing plan of action. As Doxiadis acknowledged, his experience during the war years was instrumental in the crystallization of his planning theory.

With the end of the war, Doxiadis came to the forefront of the efforts for the rehabilitation of the country, putting to test some of his ideas. As early as November 1944 Doxiadis organized a large exhibition which mapped the destruction of Greece and outlined a plan for its regeneration. The scope of the exhibition impressed Greek officials and foreign representatives as a pioneering effort. The exhibition later travelled to Paris, London, and San Francisco at the founding of the United Nations, where Doxiadis represented Greece seeking foreign aid. Soon afterwards he was assigned the Ministry of Reconstruction and then he became Associate Minister for Coordination. Between 1948 and 1951 he supervised the handling and distribution of American aid to Greece through the Marshall Plan and he represented his country at many international meetings on postwar reconstruction and development. Doxiadis became actively involved in all aspects of Greece's recovery programme – the restoration of transportation and communication networks, the rebuilding of the rural economy, the rehabilitation of fisheries and harbours, the provision of housing and education. His efficiency and resourcefulness in addressing the country's needs quickly and with limited means were often praised inside and outside Greece, while some criticized the boldness and assertiveness of his work. In 1951, while the implementation of the Marshall Plan was approaching completion, Doxiadis's cabinet post was abolished by the Greek parliament as a result of political rivalry. The abrupt and disappointing interruption of his work for the government lead Doxiadis to establish a private enterprise, Doxiadis Associates, which was the first private office in Greece that supported research in addition to design and building.

The practice of Doxiadis Associates was in large part based on the planning principles of "Ekistics", or the "Science of Human Settlements". The term Ekistics was coined by Doxiadis and was derived from the Greek word *oikos* meaning "house". It emerged as a rejection of customary architectural

and planning practices – which, being the product of individual experts, Doxiadis argued, were inadequate to cope with the rapid increase of global population, the chaotic expansion of cities and regions, the immense demands of transportation and space, and the environmental problems that accompanied modern technology. Ekistics proposed the synthesis of all branches of knowledge, so that economic, social, political, administrative, technical, environmental, and aesthetic aspects of the built environment are all coordinated in a comprehensive manner to encompass all scales of human settlements from the individual neighbourhood to the global environment.

During the 1960s Doxiadis Associates grew to be one of the largest development consulting firms in the world. Doxiadis's Greek identity allowed him to take up many jobs in nations freed from colonial rule, because—unlike his western counterparts who carried an imperialist stigma—he gained the confidence of many local governments who struggled to cope with new urban needs. A charismatic speaker and a skilful coordinator, he worked as a consultant for the United Nations, the International Bank for Reconstruction and Development, the International Cooperation Association, the Ford Foundation, the Redevelopment Land Agency of Washington, DC, and for the governments of Ghana, India, Iraq, Jordan, Lebanon, Pakistan, Spain, the Sudan, and Syria. Within Greece his projects included, among others: a redevelopment project for the Saronic coast (1959); Aspra Spitia, Antikyra – a housing project for the personnel and workers of a large aluminium plant (1965); feasibility studies for highways (1963); feasibility studies for tourist development for the western Peloponnese and the Ionian islands (1964); and the Apollonion Vacation Development, Hagios Spyridon, Porto Rafti (1970–81). Doxiadis Associates also designed industrial plants and made surveys for the Greek Government regarding infrastructure development. In the late 1950s Doxiadis Associates made a master plan for Athens which was based on Doxiadis's generic scheme for the future city, "Dynapolis", which had a dynamic core that would expand along a controlled axis.

Along with his practice, Doxiadis also established the Athens Technological Institute which trained specialized assistants and technicians both from Greece and from abroad. In 1963 he became a lecturer in town planning at the Technical University of Athens. (He was also a visiting lecturer at many prestigious universities in the United States.) At the same time, he was a prolific writer and produced many books and articles on Ekistics. One of Doxiadis's most significant ventures was the Delos symposium in July 1963 to which he invited 30 thinkers, planners, architects, sociologists, anthropologists, geographers, lawyers, economists, geneticists, physicists, and administrators on a cruise around the Greek islands to discuss the problems of urban explosion in the world, an event which further increased the international profile of Ekistics.

Doxiadis continued his work until his death in 1975. With the theoretical shifts in the architecture and planning of subsequent decades, Doxiadis's large-scale interventions came under scrutiny for overlooking cultural particularity; but the contributions of his theory of Ekistics to the realms of architecture, planning, and policy making in the period after World War II have not yet been sufficiently explored.

PANAYIOTA PYLA

Biography

Born in Stenimachos, Bulgaria, in 1913, Doxiadis was educated in Athens and Berlin and began his career in 1937 as a town planner for Athens. His experience of the devastation caused by World War II led him to believe that a concerted plan of action was required for the problems of shelter in Greek towns and villages. He supervised the administration of US aid to Greece in 1948–51. He developed a science of human settlements based on "Ekistic" principles which involved a synthesis of all branches of knowledge. He died in 1975.

Dreams

Dreams are a universal human phenomenon. Everyone dreams, although not everyone is able to remember their dreams. It is, therefore, unsurprising that people in Greece have always dreamt. What is interesting is the unusually detailed historical record of dreams from Homer to the present day. This textual span allows one to study the cultural history of dreams in Greece in a manner possible in only a few other places such as China and India.

Dreams had begun to be used for divining the future already in ancient Mesopotamia and Egypt. Indeed, the Greeks may well have borrowed from these two great civilizations. The earliest Greek dream on record is Agamemnon's in book 2 of the *Iliad*. It is a false dream sent by Zeus counselling Agamemnon that he will achieve victory if he launches an immediate all-out attack on the Trojans. Homer describes this as an *oulos oneiros*. Although scholars have always translated this as "destructive dream", the adjective *oulos* could also mean "woolly" or "kinky". In the *Odyssey* (book 19) Penelope explains that there are two kinds of dreams: those that come down to mortals through a gate of ivory are false; those that pass through a gate of horn are trustworthy. One speculative commentator ventured that this symbolism arose because ivory is always opaque while horn, if sliced thinly and polished, can be translucent.

The dream in Homer was generally conceived as a personified force that travelled from the realm of the gods to the beds of humans. This view was debated in the Classical period as can be seen in Herodotus' account of the dreams that came to

Xerxes, encouraging him to attack Greece. Convinced that these dreams were sent by the gods, Xerxes persuaded his adviser, Artabanus, to impersonate him and sleep in his bed to verify this momentous dream. Artabanus at first protested that dreams are purely products of the inner self: "nearly always these drifting phantoms are the shadows of what we have been thinking about during the day". Yet when he slept in the king's bed, the same dream not only appeared to him, but recognized him as the king's adviser and threatened to burn out his eyes with iron rods if he did not approve the plan to wage war. In later historical periods dreams came to be viewed more as internal states. Although grammatical gender does not necessarily reflect a real-world perception of animateness, it is interesting to note the sex change undergone by the word for dream. It began as a neuter form *to onar*, developed a personified masculine form *ho oneiros*, freely alternated for a long while between masculine and neuter forms, but then exclusively assumed the neuter noun form – *to oneiro* – that it possesses today.

The recognition that dreams were products of the human imagination did not exclude the possibility that they could also be prophetic. Aristotle addressed just this question in his tract *On Prophecy in Sleep* where, like Artabanus, he sceptically contended that dreams were just representations of personal wishes or stimuli felt during sleep; they could only be prophetic in minor ways such as predicting the onset of illness in the dreamer. Dreams were, indeed, embraced as a diagnostic tool by the Greek medical tradition as attested by the Hippocratic texts and by Galen.

Aristotle's sceptical views notwithstanding, the general population continued to hold that dreams could be interpreted to forecast the future. Artemidorus' 2nd-century AD text, *The Interpretation of Dreams*, attested to this public conviction. Artemidorus was a professional interpreter of dreams and the latter portion of his book was dedicated to his son who would succeed him. His instructions are extremely valuable for, unlike dream-interpreting keys (*oneirokrites*) that simply matched symbols to interpretations in dictionary fashion, Artemidorus explained how and why he reached his interpretations of dream symbols. Artemidorus thought it important to travel to understand the customs and cultures of the people whose dreams he was asked to interpret. He also thought that the meaning of symbols varied depending on the individual. One man reported the same dream of himself without a nose at three different moments of his life. The first time meant that he would lose his perfume business; the second time that he would be disgraced (lose face); and the third time, that he would die (since a skull has no nose).

In a gesture towards Aristotle, Artemidorus differentiated so-called "state dreams" (*enypnia*) – produced by current worries, feelings, or wishes – from prophetic dreams (*oneiroi*) that could literally or allegorically tell the future. It was only this latter category of *allegorikoi oneiroi* that required the services of a dream interpreter, although it must have been difficult for anyone to know in advance exactly which kind of dream had been had. Subsequent dream interpreters, including the 4th-century AD Neoplatonist Latin writers Macrobius and Chalcidius, proposed similar divisions of dreams into four or five classes, depending on whether they were true or false, divine or physical, interpretable or not. In denying the significance of "state dreams", ancient dream interpretation dismissed the very sorts of dreams to which Freud would later attach the most significance.

The first response of Christianity to dream interpretation was to outlaw it – a step formally taken at the Council of Ankara (AD 314). In the Christian view the future belonged to God alone to decide and reveal. Prophecy was neither an appropriate nor a feasible endeavour for lay dream interpreters to engage in. One particular cult the early Church was eager to eradicate was that of Asclepius which boasted hundreds of shrines up and down Greece. Asclepius was a healing god and one of his modes of operation was through a practice that scholars have labelled "incubation". This involved pilgrims attending these Asclepian shrines, and sleeping in the inner sanctuary. There the god would appear to them in dreams, sometimes in the form of a snake, and he would either prescribe a remedy or else directly cure the ailment. The chronically ill 2nd-century AD rhetorician Aelius Aristides presented, in his book *The Sacred Tales*, a record of the dreams he saw and the cures Asclepius recommended he undertake.

The Church realized that it could not wipe out popular beliefs in healing dreams and so adopted a strategy of appropriation. The shrine of Asclepius at the foot of the Acropolis, for example, was converted into a church dedicated to St Andrew, patron of the sick, where people continued to practise incubation. New healing saints and Christian sites for incubation arose throughout the Middle Ages, an example being the church of St Artemios in 9th-century Constantinople where men went to be cured of hernias. Books of dream-interpreting symbols continued to circulate in Byantium, some with titles such as the *Oneirokritikon of Achmet* that related them to the East. This was not just because the East was a place where the prophetic arts were more advanced. Some of these were originally Greek dream books such as that of Artemidorus, that had been translated into Arabic, and then back into Greek.

The proliferation of such texts attests to the popular interest in dream-interpretation through the Byzantine and Ottoman periods up to today. *Oneirokrites* circulate in cheap editions in Greece today, and many households possess a copy of one and/or a family member skilled in the predictive interpretation of dreams. The Church still maintains that lay people lack the faculty of discernment necessary to separate demon-inspired false dreams from divine-sent true dreams. Clerical guidance should be sought.

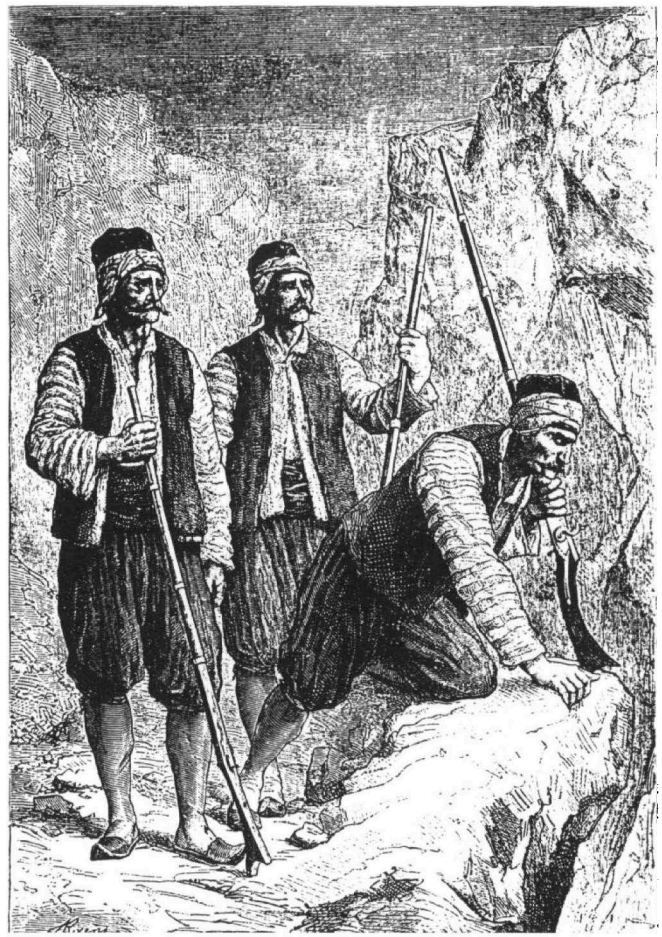
Dress

Dress reveals much about society and culture. Generally, the further one goes back in time, the more difficult it is to establish an accurate history of dress. Greece's climate is detrimental to the preservation of textiles, so scholars must rely on visual and written evidence to determine the dress worn in Greece before modern times.

The earliest evidence for Greek dress dates from the Middle and Late Minoan periods (2100–1150 BC). Frescos, statuettes, vases, sarcophagi, and seals from Crete, Thera, Mycenae, Tiryns, and Tanagra help historians to reconstruct a general picture of Minoan dress. Substantial amounts of gold jewellery survive, including necklaces, earrings, rings, diadems, bracelets, and belts.

The snake goddesses from Knossos in Crete are famous in dress history for their bare breasts. These figurines, made of faience, wear fitted bodices that fasten just below the bustline. Some scholars believe that only goddesses and priestesses wore such revealing bodices since other artwork shows women wearing close-fitting tunics that cover the breasts. Women of all ranks wore bell-shaped tiered skirts, curved apron-like garments that covered both front and back, and belts that cinched their waists. They wore crowns, festoons of pearls, and diadems over dark, curled tresses. A fresco of a woman with reddened lips and accentuated eyes known as La Parisienne makes Minoan women out to be quite glamorous. Women who participated in bull riding wore the same attire as male participants – double aprons with narrow rolled belts and protective coverings around the ankles – suggesting an egalitarianism that women in Greece have not enjoyed since then.

Men appear less frequently in Minoan art than women. Frescos at Knossos and Thera depict men wearing either loincloths or patterned loin skirts decorated with tassels in front. Sometimes men wore tunics edged with decorative bands. Men's hair, like women's, was long and curly. Some images of men, such as the Prince of the Lilies at Knossos, have exceptionally narrow waists, possibly a result of rolled leather or metal belts placed on their bodies in childhood. From the frescos at Thera, it appears that boys wore little more than strings around the waist, or even nothing at all. Children's heads were partially shaved, possibly to prevent ringworm. When not barefoot, Minoans wore sandals or soft pointed shoes.



Dress: inhabitants of the Mani, dressed to kill, French engraving from 1881

Minoans had a love of colour and pattern. Clothes were decorated at the edges with patterned bands. Barber (1991) argues that the patterns were woven, but such designs could also have been embroidered or painted on cloth. Remains of a linen tunic discovered in a bronze amphora dated 1000 BC from Lefkandi in Euboea reveal edges decorated with woven and embroidered bands. Ornaments on such bands and in jewellery include rosettes, lilies, birds, saffron flowers, butterflies, double axes, bull's horns, and bees. Minoan dress reveals knowledge of sophisticated cutting and fitting that is atypical of the time. Draping cloth around the body was the norm for contemporaries of the Minoans as well as a mark of civilization. Scholars believe that among early civilizations tailored clothes derived from the wearing of skin garments which were fitted and stitched to accommodate the size and shape of skins.

After the decline of Crete and the destruction of Thera around 1450 BC, Mycenae achieved dominance over Greece. Archaeological finds from Mycenae, Tiryns, and Tanagra show that dress on the mainland was indistinguishable from that worn on Crete and Thera during the Middle and Late Minoan periods. Mycenaean soldiers are shown wearing fringed tunics,

Dress: officials of the *epistasia* on the streets of Karyes on Mount Athos, wearing the official foustanella for a ceremonial event

helmets, and protective coverings for their shins. During Greece's Dark Ages the fitted bodices, tiered skirts, and loin cloths disappeared along with the elaborate patterned fabrics. By the time the Archaic period began, the Greeks had donned uncut rectangles of cloth draped on the body. The cloth came off wide, warp-weighted looms, and required no cutting or stitching for use as garments.

The basic piece of clothing for both men and women was the chiton, a tunic-like garment that fastened at the shoulders. It could be long or short depending on the wearer's gender and age. Women generally wore ankle-length chitons while active males and youths wore short ones. The chiton was draped in one of two basic ways – Doric or Ionic – so-called today because each resembled the capitals on architectural columns. The wool Doric chiton was folded over at the top and pinned once at the shoulders with large straight pins. The overfold, which often ended in a patterned band, extended to the waist. This style, termed *peplos*, originated during the Archaic period. The Ionic chiton, an innovation adopted from Ionia, had no overfold. The fabric, either linen or lightweight wool, was fastened several times at the shoulders and along the arms with stitches or small brooches called fibulae, creating a sleeve effect. Belts or loose stitching kept the garment, which was open down the side, in place. Belts with tassels apparently had a seductive quality about them. In the *Iliad* Homer tells of Hera's tasselled belt which Zeus found irresistible.

The chiton has an interesting social history. According to Herodotus, during the Persian Wars the Athenians outlawed the Doric chiton after Athenian women killed the lone survivor of a military campaign by stabbing him with the pins from their dresses. It was replaced with a foreign innovation, the softly pleated Ionic chiton. After the Persian Wars ended, the patriotic Greeks returned to the older indigenous form of dress, the Doric chiton. The Ionian style returned during the Classical and Hellenistic periods. During the Hellenistic period the chiton was belted high, creating an "Empire" waistline. The changing preferences in chitons are evident in sculpture. Artists took great pains to render the details carefully, as seen in the *Charioteer* at Delphi, who wears a long Ionic chiton, and the Caryatid maidens at the Acropolis, who sport Doric chitons.

Greeks wore a variety of wraps, most commonly the himation. In wide use by the late 6th century BC, it was almost always worn over the chiton. The most common method of draping the himation allowed the right arm to be free. Women used their himations as veils when outside the house, since respectable women would cover themselves. Other coverings included the smaller *diplax* and the square chlamys, a cloak preferred by travellers and soldiers since it doubled as a blanket.

Male athletes sometimes performed naked, at other times in a simple loincloth. Greeks prized athletic bodies, grooming and

anointing themselves with fragrances and oils. Working-class men and slaves wore a short, rectangular garment called *exomis* which fastened at the left shoulder. Both men and women wore sandals. Jewellery included necklaces, earrings, rings, and pins.

Although we know that the ancient Greeks wore coloured clothes from the paint remaining in the crevices of sculpture and from written sources, our knowledge of colour from visual sources is limited because vase painting does not reveal colour, and the pigment has worn off statues. Pliny mentioned the "flowered colours" of women's clothes. Men and women sported a variety of hairstyles and headgear. Men were bearded with long hair during the Archaic period, but during the Classical period short haircuts and a clean-shaven look prevailed. A broad-brimmed hat called a petasus offered protection from sun or rain. The popular Phrygian bonnet, a brimless peaked cap, reappeared in the Middle Ages, and again during the French Revolution as a symbol of democracy. Women wore their hair long during the Archaic period but bound it in knots and chignons in the Classical and Hellenistic periods with bands, nets, cloth, and metal filets to keep the hair in place.

The dress of Classical Greece has had widespread influence throughout history. During antiquity Greek dress spread to other Mediterranean areas including the Etruscan and Roman worlds. Centuries later, whenever Greek politics, art, or philosophy was ascendant, fashionable dress took on the lines, colours, and details of ancient Greek dress.

Actual garments survive from as early as the 3rd century AD to inform us about the fabrics and construction of clothing during the Graeco-Roman period. Whole tunics come from the Copts, a Christian religious sect living in Egypt who buried their dead fully dressed in the desert. Initially woven of linen on wide vertical looms, the tunic (a Roman innovation) was seamed only at the sides. With the adoption of horizontal looms, the Copts (and presumably others in the Mediterranean) started piecing tunics from narrower widths of fabric and sewing on sleeves. Skilled weavers added colourful tapestry-woven stripes (*clavi*), squares, and roundels of wool. These tunics display motifs typical of the Hellenistic period including detailed portraiture. Gradually, the motifs took on Christian symbolism or changed to Christian imagery.

The inhabitants of the Byzantine empire wore similar tunics with mantles and cloaks. The difference lay in the fabrics. Extant mosaics and statuary show garments embellished at the hems and seams, sometimes with jewels. The Byzantines were avid consumers of complex patterned silks woven in Near Eastern textile centres and eventually established their own thriving silk industry. The colour purple was highly desirable in dress, although its use was limited to the most wealthy. Byzantine silks survive in church treasuries throughout Europe, particularly in the Vatican.

With the collapse of the Byzantine empire in 1453, much of Greece fell under the control of the Ottomans. Italian city states controlled some islands and parts of the mainland. Albanians and other ethnic groups in flight from the Turks settled in parts of Greece. This complex cultural landscape left a multilayered sartorial history that is evident in Greek traditional dress of the 19th and 20th centuries. Regional customs dictated dress practices and served to locate the wearer geographically. Clothing also signalled ethnicity during this period, especially on the mainland where each ethnic group had its own distinctive attire.

By the 19th century the inhabitants of mainland villages wore Byzantine-inspired dress. Men wore simple tunics over woven or knitted leggings. Women wore white chemises, woollen coats or jackets, headscarves, and belts. Female dress denoted age, marital status, and social rank. Some clothing had magico-religious connotations, particularly when associated with women of childbearing age. The colours red and black, embroidered hems and seams, and fringes had symbolic connotations that figured prominently in the most conservative forms of village dress.

In areas under Italian influence, such as the Ionian islands, some of the Aegean islands, and parts of Crete, local dress was inspired by the styles of Renaissance Europe. Chemises cut with full sleeves and skirts gathered at the waistline reflect western European influence. Conversely, in areas under Turkish rule, women donned caftan-like garments and undertrousers of Turkish fabrics. Their chemises were cut like those found in the dress of Turkish women. Turkish influence continued to be strong in areas that remained under Ottoman rule until the 20th century. Island men wore knee-length *vraka* (Turkish-style breeches) while the Vlachs and Sarakatsans on the mainland wore ankle-length trousers.

During the Greek War of Independence, resistance fighters adopted the dress of the Albanian soldiers that consisted of a white pleated skirt called a fustanella (one of the few examples of men in skirts in modern times), wide-sleeved shirt, waistcoat, fez, knitted stockings, and tasselled shoes. After the war, fancy versions of this costume became the official attire as established by Otho, Greece's first king. Lord Byron was painted in this costume. Village Greeks of Albanian heritage wore the fustanella or the *poukamiso* (an elongated shirt) on a daily basis well into the 20th century. Soldiers guarding the Tomb of the Unknown Soldier in Athens wear the fustanella today. Greek schoolboys dress up in a fustanella for holidays, for it has become the national costume. The corresponding costume for females is the Amalia costume, so named after Greece's first queen. It consists of a tight-fitting embroidered jacket, long silk skirt, and fez cap.

After Greece's liberation from Turkish rule, traditional dress was gradually abandoned. The first to give it up in favour of fashionable French styles were the inhabitants of the main towns and cities. Next came islanders with commercial ties to European cities. The inland villagers retained their customary dress longer. The Arvanites in Messoghia, for example, wore their traditional dress until after World War I, while the Karaghounes in Thessaly kept theirs until the mid-20th century.

The dress of Classical Greece influenced fashionable dress outside Greece at numerous times in the 18th, 19th, and 20th centuries. With the excavation of Pompeii in 1719 and Herculaneum in 1748, Europeans rediscovered the ancient Mediterranean world. Artists portrayed sitters in Classically draped fabrics. Aristocratic women in England and France, including the French queen Marie Antoinette, wore white cotton dresses for informal wear. After the French and American revolutions of the late 18th century came a renewed appreciation of Greek and Roman Classical drapery as visual

representations of democracy and republican ideals. Women throughout Europe and America wore classically inspired white gowns, hair arranged *à la grecque*, and himation-like wraps. Such Neoclassical styles dominated fashion during the French Directoire and Empire periods.

Neoclassicism in dress eventually gave way to Romanticism which inspired the tight corsets and voluminous skirts of the mid-19th century. In the 1870s and 1880s exaggerated, fussy styles replete with bustles, drapes, and swags brought forth critics who recalled the elegance and simplicity of ancient Greek dress. Artists such as Frederick Leighton and Edward Burne-Jones who were associated with the Aesthetic Movement in Britain painted women in Greek chitons in soft ethereal colours. The Classical styles depicted by these artists influenced the dress designs of women in artistic circles. Dress reformers also idealized the uncluttered lines of ancient Greek dress, promoting it in their publications and exhibitions.

Not until the first decade of the 20th century did a Paris couturier incorporate Classicism in dress, eventually influencing mainstream fashion. The Frenchman Paul Poiret, who designed from 1903 to 1926, is credited with freeing women from the corset by garbing them in simple Empire-waisted tunics. A dress of 1910 called "Pénélope" consisted of an overblouse printed with Greek-inspired motifs and a finely pleated white skirt. The Spanish-born designer Mariano Fortuny, who worked in Venice, incorporated ideas from Minoan and Classical Greece into his designs. His Knossos veil used motifs inspired by Minoan frescos while his most famous creation, the Delphos dress, consisted of a tube of finely pleated silk either draped with an overfold like the Doric chiton or clasped at the shoulder with Venetian glass beads in imitation of the Ionic chiton. Fortuny stated that this dress, named after the *Charioteer* of Delphi, was "derived from the Classical robe".

Other 20th-century dress designers inspired by the Hellenic tradition include Alix Grès and Mary McFadden. Mme Grès, who opened her Paris couture house in 1934, specialized in beautifully draped gowns of neutral-coloured silk jersey. Beginning in 1976 in New York, McFadden used the thermoplastic nature of polyester to create permanently pleated evening gowns. Fashion critics consider the designs of Grès and McFadden to be classics, lending credence to the longevity and timeless appeal of the Hellenic tradition in dress.

Dyrrhachium

City in modern Albania

Dyrrhachium (now Durres in Albanian, Drasch in Turkish, Durazzo in Italian), situated on the Albanian coast, was founded in 627 BC by the Corcyreans and Corinthians (Thucydides, 1. 24) and remained an important port and commercial town in antiquity and medieval times; the coins of the town show a cow suckling its calf, symbolizing the dependence of the colony on the mother city. The Greeks named the town Epidamnos; but the Romans preferred the Illyrian name of Dyrrhachion/Dyrrachium (which at first was used only for the upper part of the town), probably because they regarded the second part of the Greek name (recalling the Latin word *damnum*, "damage") as a bad omen.

The Greek town Epidamnos had an oligarchic constitution; trade with its Illyrian neighbours soon made it so prosperous that it could afford to build a treasury at Olympia (Pausanias, 6. 19. 8). Inner conflicts in the 430s BC which then involved Corcyra (modern Corfu), Corinth, and Athens were one of the triggers of the Peloponnesian War. In 314 BC the Macedonian king Cassander took the city, but lost it soon afterwards to the Corcyreans who gave it to the Taulantian king Glaucias. In later Hellenistic times Epidamnos had the reputation of being a dissolute sea port.

As for the buildings of Greek times, several temples are mentioned in inscriptions, among them one of Athena/Minerva and another of Artemis/Diana. Only the sanctuary of Aphrodite has been excavated, bringing to light about 6 tons of mostly late Hellenistic votive figures in terracotta varying greatly in size. Many of them wear Illyrian costume, as also do many people depicted on the numerous grave stelai found in nearby cemeteries, which are often a source for Illyrian names. Although Albanian scholars used to stress the continuity of Illyrian traditions from ancient times until today, there can be no doubt that by the 4th century BC, at the latest, the Greek element dominated the country surrounding Dyrrhachium; many centuries later, Albania's national hero Skanderbeg not only received the inspiration for his name from Alexander the Great (Skanderbeg derives from Alexander bey), but also his helmet with two horns (a copy of which is preserved) was modelled on a similar helmet worn by Pyrrhus of Epirus in 287 BC.

At the end of the First Illyrian War (229 BC) Dyrrhachium came under Roman protection. A *civitas libera* already in republican times and a *colonia* under Augustus, Dyrrhachium was important because of its geographical situation: from the

1st century BC onwards the town was the starting point of the Via Egnatia leading to Thessalonica and then on to Byzantium; it was also the usual port for ships coming from Italy (Brundisium, modern Brindisi) and therefore played a significant role in the Roman civil wars; in 48 BC Pompey had his camp there and was besieged in vain by Caesar.

Dyrrhachium's apogee came after Augustus had stabilized the Roman empire; many remains of imperial times have been found, though modern Durres, with about 80,000 inhabitants and the second largest city after Tirana in Albania, covers most of the ancient city, thus making excavation nearly impossible. In the northern part of the city the Roman amphitheatre (already mentioned in 1510 in Marinus Barletius' biography of Skanderbeg) has been excavated to reveal a typical Roman building, a very rare occurrence in the Greek east but to be explained by the settlement of Roman army veterans. Constructed during the reign of the emperor Hadrian (117–38), the huge, oval ampitheatre measures of 127 × 103 m (arena 63 × 39 m) and could seat about 15,000 spectators; people moved in and out by way of subterranean stairs and galleries, which are well preserved in places, while the animals and gladiators entered the arena through big gates in the north and south of the building; an inscription records that 12 gladiatorial fights were given to celebrate the inauguration of a new library. In the western part of the amphitheatre a little chapel was later inserted (probably in the second half of the 6th century); on its southern wall one of the very few preserved wall mosaics of the early Byzantine era (the only one in Albania, in fact) shows the Virgin Mary as queen of the heavens in imperial garb, accompanied by Michael and Gabriel, and nearby St Stephen praying. During the reign of Hadrian a 15-km aqueduct was also built (restored by Severus Alexander 222–35) of which leaden water pipes with inscriptions mentioning the emperor and the officials in charge of the water supply have been preserved; great baths of the 2nd century AD with floor heating and sumptuous floor mosaics have been partially excavated. It is still unknown where the Greek and Roman fortifications were located.

Dyrrhachium was destroyed by earthquakes in AD 314 and 522, and in 481 it was besieged by Theodoric the Ostrogoth; nevertheless the town flourished as an episcopal see and capital of the province Epirus Nova, later a theme of the Byzantine empire. The emperor Anastasius I (491–518), who was born in Dyrrhachium, erected a new city wall (built of bricks and fortified by pentagonal towers) after the destructions caused by earthquakes and the Gothic invasion; it is well preserved in the western part of the town. There are also foundations of a large 6th-century church, whose donor Martinia is commemorated in a floor mosaic. There must have been several other impressive buildings (mainly churches) in the 5th and 6th centuries of which few traces are left.

More sieges followed: by the Bulgarians in the 10th and 11th centuries, and by the Normans in the 11th and 12th centuries, as Dyrrhachium lay on their route for advancing into the Balkans; it was taken by Robert Guiscard in 1081 and by William II in 1185. Although the town still prospered in these times and sources mention numerous churches, almost nothing of its medieval architecture has survived; there are, though, some reliefs and the fragment of an ambo dating from the 11th and 12th centuries. During the Latin empire Dyrrhachium was the capital of the despot Michael of Epirus; his successor Theodore renewed the town walls (one of the mighty wall towers bears an inscription with his name and the date 1235).

In 1273 another earthquake started an irreversible decline that continued during the reign of the house of Anjou and the Venetian empire (1386–1501); under the Ottoman empire the town dwindled to 1200 inhabitants. It recovered, however, and in 1912 it was for a short time capital of the newly founded Albania.

Summary

Now Durres, city in modern Albania on the Adriatic Sea, founded in 627 BC by Greek colonists, Dyrrhachium was later a Roman colony and flourished as a free city in the 2nd century AD. It remained strategically and commercially important as a port throughout ancient and medieval times. Decline set in from the 13th century. Today it is the second city of Albania.

E

Eagle, Double-Headed

Emblem of the Byzantine empire

The mythological presentation of the eagle with two heads and its possibly apotropaic, and protective, character was a common figure among the prehistoric cultures of Mesopotamia, Syria, Asia Minor, and Egypt. Its appearance in the Hellenic tradition goes back to the period of the Mycenaean civilization, as suggested by finds from Mycenae and the south Peloponnese.

The reappearance of the double-headed eagle on Greek soil takes place in the Byzantine empire during the reign of the Palaiologan family in the 13th century. One of its first representations in Byzantine art can be found on the chapter of the iconostasis at the Porta Panagia church (1283) in Thessaly as well as on the founder's inscription at the Paragoritissa church (1294/6) in Arta. From the archaeological evidence it would seem that the symbol of the double-headed eagle was introduced into the Byzantine empire not by the Komnenian dynasty, as some scholars believed in the past, but by the Palaiologan emperors. During the Byzantine period and until the fall of Constantinople in 1453 the double-headed eagle was used as an emblem of the empire and definitely not as the coat of arms of the ruling Palaiologan family. That it was also used by the Kantakouzenos family among others, as well as by some merchant ships of the Italian peninsula to show their tax-exempt status, supports this thesis.

The double-headed eagle is depicted on a variety of icons, frescoes, illuminated documents, ceramics, jewels, and reliefs, while most Byzantine leather bindings of manuscripts that have survived from the 15th century are stamped with this motif. Its representation varies: it can be crowned (with one, two, or three crowns) or not and occasionally it is found carrying a sceptre and the imperial orb. Similar representations, mainly on wall paintings in neighbouring kingdoms (e.g. Serbia, Bulgaria), demonstrate the attempt to imitate Byzantine imperial ritual and symbolism.

After 1453 the double-headed eagle was adopted by various rulers of the Greek islands and Venetian colonies, who were interrelated with the Byzantines, either in order to legitimize their power or in order to declare their dominion as the legitimate successor to Byzantium; for the same purpose a double-headed eagle decorated the throne of Ivan III of Russia after his marriage to the last Byzantine princess Zoe.

The Ottoman empire passed on to the Orthodox patriarch of Constantinople many of the former emperor's functions and insignia including the double-headed eagle which was adopted by the patriarch as the symbol of the Orthodox Church. As the prosperity of the semiautonomous principalities of Walachia and Moldavia grew, their rulers, who became great benefactors of the Orthodox churches and monasteries, also imitated the Byzantine style and decorated their clothes and arms with the double-headed eagle. During the Tourkokratia, the double-headed eagle was used in church decoration and was often depicted on the carved iconostasis or in the middle of the floor as an *omphalion* (centrepiece) as well as in private homes on doors, embroideries, and on furniture.

The question of its meaning cannot be answered with absolute certainty. In the prehistoric period the double-headed eagle was probably a protective, magical, or apotropaic symbol; in other cases, it personified the "multiplied wisdom" of the god. Its representation on coins, seals, and manuscript illuminations in medieval Europe from the 12th century onwards relates to its heraldic meaning as a symbol of a city or as a coat of arms of a noble family. In imperial iconography it was also used in order to distinguish the emperor (double-headed eagle) from the king (one-headed eagle). As for Byzantine iconography, apart from some miscellaneous information about its significance as an imperial emblem, most of the references derive from Tourkokratia and from western sources. According to them, the two heads of the eagle symbolize the claims to both eastern and western halves of the Roman empire and refer either to the eschatological elements of the emperor cult based on the apocalyptic eagles of Ezekiel's prophecy or to the temporal and spiritual power of the emperor. However, during the Tourkokratia the double-headed eagle acquired the significance of the restoration of the Byzantine empire; and nowadays the black double-headed eagle on a yellow background is used as a symbol of the Orthodox Church all over the world.

EAM and ELAS

EAM (*Ethniko Apelevtherotiko Metopo*, National Liberation Front) and ELAS (*Ellinikos Laikos Apelevtherotikos Stratos*, Greek Popular Liberation Army) were respectively the largest political and military resistance organizations in occupied Greece during the period 1941–44.

EAM was founded on 27 September 1941, following the Seventh Plenum of the Communist Party (KKE) Central Committee earlier that month. It was formed and dominated by the KKE, although another three much smaller parties (SKE, Socialist Party of Greece; ELD, Union of Popular Democracy; and AKE, Agrarian Party of Greece) also participated in it, even signing the charter of EAM.

In April 1942 EAM formed ELAS as its military branch (later ELAN, the navy equivalent, and EtA, *Epimeliteia tou Antarti*, the commissariat, were added); it was also complemented by branches in other fields, such as the EEAM (*Ergatiko Ethniko Apelevtherotiko Metopo*, National Workers Liberation Front), EPON (*Eniaia Panelladiki Organosi Neon*, a youth movement), and the EA (*Ethniki Allillengyi*, National Mutual Aid). By 1943 EAM and its subsidiary branches had in effect formed an alternative government organization, controlling large parts of Greek territory that were not occupied by the Axis; this was complemented in March 1944 by the PEEA (*Politiki Epitropi Ethnikis Antistaseos*, Political Committee of National Liberation). Throughout the period of German occupation EAM remained the only truly nationwide resistance organization, and ELAS the most powerful military resistance group. EAM and ELAS were singularly successful in recruiting and mobilizing large sections of the population and by October 1944, when Greece was liberated, claimed (probably not without justification) a joint membership of 2 million, almost a third of the total population of Greece. As it was in effective control of large parts of Greece, EAM enacted a series of wide-ranging reforms, including granting women the vote and allowing justice to be dispensed by local committees.

Despite their appearance as umbrella organizations composed of several parties, both EAM and ELAS remained firmly under communist control; however, the vast majority of rank-and-file members of EAM were neither communists nor even necessarily leftists. Similarly in ELAS the majority of professional officers were of liberal (Venizelist) leanings; control was exercised by allocating key posts to Communist Party cadres and, in the case of ELAS, by attaching to the military heads of guerrilla units political "commissars", usually communists.

EAM/ELAS almost from the outset attempted to remain the only resistance organizations, going to considerable lengths to discourage or destroy any rival groups. After October 1943 EAM and ELAS attempted to eliminate all other resistance organizations by force of arms, in what was later to be named the first "round" of the civil war; they were successful in that by the end of the occupation only Zervas' EDES (*Ethnikos Dimokratikos Ellinikos Syndesmos*, National Democratic Hellenic Union) and some small nationalist groups in eastern Macedonia and Thrace had managed to keep armed bands in the field, all others (including Psaros' EKKA) having been destroyed and/or dissolved. Subsequently, in an attempt to prevent the complete domination of the resistance movement by EAM/ELAS, the British cut off material support from it. However, with the collapse of Italy in 1943, large stocks of arms and war material had fallen into the hands of EAM/ELAS, making it largely independent of this support.

Following the sudden volte-face of July 1944, EAM agreed to participate in the coalition government of G. Papandreou; EAM ministers continued to serve for a brief period after the liberation of Greece in October 1944; however, disagreements over the question of demobilization of ELAS and the other armed groups in Greece led to the withdrawal of EAM from the coalition government. The demonstration organized on 3 December 1944 led to the outbreak of fighting in Athens and its area, the Dekemvriana, in the course of which ELAS forces fought British and loyalist Greek forces. During the fighting

EAM sided openly with the Communist Party despite dissenting voices from the junior partners in the nominal coalition, including Svolos, the former president of the PEEA.

The end of hostilities in mid-January 1945 (when an armistice was signed) and the Varkiza Agreement of February 1945 also marked the end of ELAS, which was demobilized and handed in a substantial part of its arms (though some were hidden). As a political force, EAM survived for a while longer. Indeed it was reinvented in April 1945, as a complementary political movement to KKE, a movement that would retain the wider support that EAM had enjoyed during the occupation. Needless to say, EAM was under almost complete KKE domination. Probably its last momentous political act was the decision to urge its members to abstain from the elections of March 1946, following the policy adopted by the KKE; again dissenting voices from junior partners were not heeded. At least some EAM supporters along with the hard communist core of ELAS fighters subsequently formed the basis for the Democratic Army of Greece (*Dimokratikos Stratos Elladas*, DSE), the communist insurgent force that fought the Civil War. However, the refusal of the non-KKE participants to join the communists in forming the provisional government in 1947 virtually broke the new EAM. It faded into obscurity, especially after the leftist newspapers were banned in October 1947; EAM was later itself outlawed and largely ignored by the communists for the duration of the Civil War.

During the period from the end of the Civil War until 1974, participation in EAM or ELAS was enough to colour one as a communist sympathizer (or even a communist), with all the disadvantages this had. The EAM and ELAS wartime resistance remained formally unrecognized in Greece until the early 1980s, when the PASOK government passed a bill in parliament rewarding the resistance activity of both organizations' members.

Earthquakes

The Aegean region has the highest incidence of earthquakes (seismicity) in Europe. This has had an important effect on both the civilizations and the landscape of the region. Most of these earthquakes were produced by forces connected with large-scale movements of the earth's crust and mantle (plate tectonics).

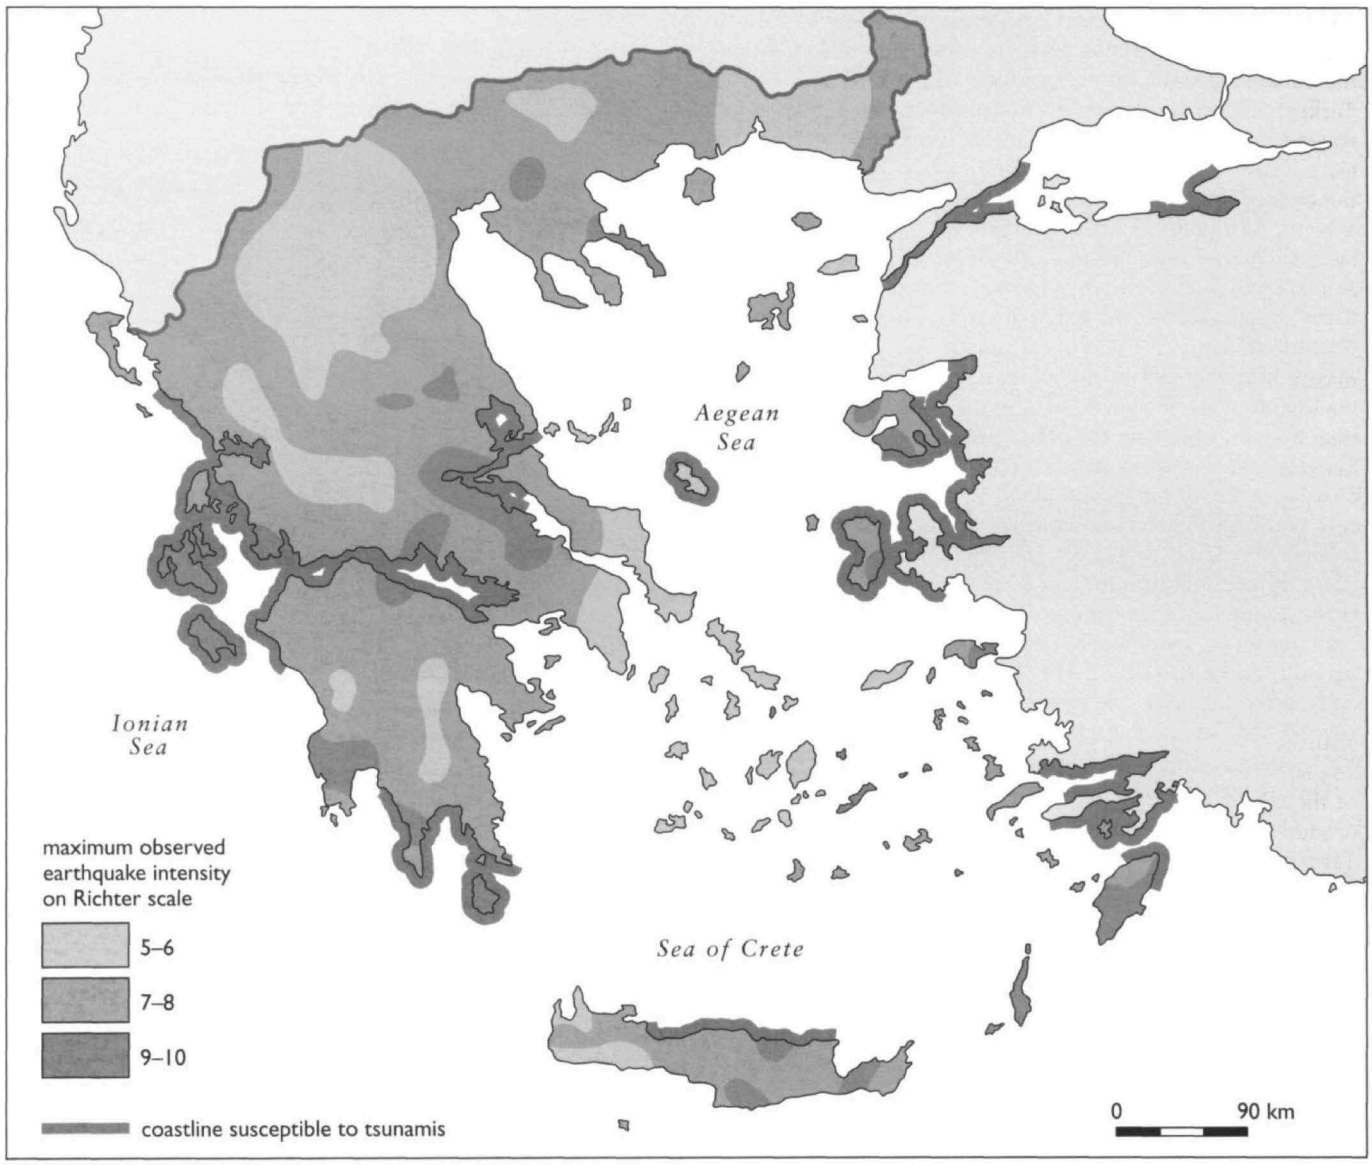
Earthquake: front page of *Akropolis* on 8 September 1999, the day after an earthquake measuring 5.9 on the Richter scale struck Athens

Earthquakes are vibrations of the earth that are produced when rocks juxtaposed across a fault slide past each other. Some faults slide very easily, so stress on the fault is dissipated continually. However, many faults are "sticky" and the stress can build up to much higher levels before the energy is released in an earthquake. The magnitude of an earthquake (the well-known Richter scale) is not a measure of destructiveness but merely indicates how much energy is released. It varies according to the amount of movement of the rocks (from a few centimetres to several metres) and the surface area of the fault that moved (from a few square metres to tens of square kilometres). The amount of vibration felt at a particular place on the earth, and hence the local destructiveness of an earthquake, is called the intensity. It is measured on the Modified Mercalli scale and varies with location. Therefore, each earthquake has only one magnitude but many intensities. The intensity depends on the distance to the centre of the earthquake, its depth, and the local geology. Many sediments, especially those in recently drained lakes, can amplify considerably the earthquake vibrations and increase the intensity.



20. Maximum earthquake intensity in Greece and the Aegean region

Underwater earthquakes or landslides can produce extraordinary waves on the sea called tsunamis (or less correctly, tidal waves). In the open sea tsunamis are typically less than 50 cm high, travel at speeds of up to 200 km per hour, and have a wavelength of the order of tens of km: hence they are not noticed generally by people in boats. Near to the coast their character changes dramatically – as the sea becomes shallower the wave height increases to up to 50 m. Such waves can be extremely destructive in coastal communities.

The movements associated with an earthquake will generally produce changes in the height of the land across the fault of up to several metres. Along the coast these changes in height will appear as local changes in sea level. Such changes have submerged coastal cities and quarries and left harbours dry. Such local effects should be distinguished from global long-term sea-level rises caused by melting of the ice caps since the peak of the last glacial period 20,000 years ago.

Just before an earthquake there are often changes in the environment, some of which have been used to try to predict the timing of the earthquake. Among these are changes in the water level in wells and in the discharge of springs. The general level of ground noise (very small earthquakes) may also change before an earthquake. Lastly, many people have noticed unusual animal behaviour before an earthquake. If true, this may be related to any of the effects listed above or to changing magnetic and electrical fields. As yet, there has been little success in the prediction of earthquakes.

Seismic risk can also be measured in several different ways, but the most important from a cultural point of view is the maximum intensity or destructiveness of the earthquake. The maximum intensity is much higher in some parts of the Aegean because they lie close to the edge of tectonic plates. The high maximum intensity of the Ionian islands and southwestern Peloponnese is due to the subduction of the ocean floor (albeit thicker than normal) beneath the Aegean Sea. The ocean floor has to bend in order to go down the subduction zone, and this movement causes the earthquakes. High maximum intensity on Crete and Rhodes is also related to the same plate motions,

but here the direction of movement is almost parallel to the Hellenic arc (now the Ionian islands, the western Peloponnese, the islands of Crete, Karpathos, and Rhodes, and southeastern Turkey), and hence the two plates slide past each other along transform faults. A zone of earthquakes associated with a tectonic plate boundary extends from the northern Aegean through the Sea of Marmara and across northern Turkey. Most of the other zones of high maximum intensity are related to crustal extension north of the Hellenic arc: this has produced a series of approximately east–west grabens (tectonic valleys). There are still important movements on the Corinthian and Euboean gulf grabens, hence their high maximum intensity. The high maximum intensity of many of the islands in the eastern Aegean is probably related to grabens that stretch from the Aegean Sea itself deep into the Turkish mainland.

There were many earthquakes in antiquity, but few have been identified and studied in detail. The earliest has been only identified by the effects of the accompanying tsunami. This was an earthquake, or possibly a landslide, associated with the great Minoan volcanic eruption of Thera (modern Santorini) in 1650 or 1450 BC. The tsunami deposited sediments on the adjacent island of Anafi up to a height of 40 m and was still 7 m high when it reached Israel. It must also have devastated settlements on the northern shore of Crete. The earthquake of 464 BC that destroyed Sparta was an important historical event of the Classical period. It was a medium to large earthquake produced by vertical movement on the fault at the base of the Taygetus Mountains. The earthquake and tsunami of 373 BC in the gulf of Corinth were responsible for the destruction of the city of Helice, remains of which have not been located. It was probably 7 km west of Aigion, on the western gulf. Contemporary writers noted that wild animals and insects left the city during the five days preceding the earthquake, and this has often been cited when premonitory animal behaviour is discussed. The city was submerged by movements on the fault, and its destruction was completed by the tsunami and further earthquakes along this fault. The earthquakes that toppled the Colossus of Rhodes in 222 BC caused parts of the land to rise almost 4 m, which was one of the largest earth movements in the region during the last 10,000 years. The harbour at Phalasarna in western Crete has been lifted up by over 7 m since antiquity. This must have occurred during several earthquakes, including the devastating earthquake of AD 365 centred south of Crete. The ensuing tsunami caused the loss of thousands of lives and extensive damage throughout the eastern Mediterranean. Another earthquake in AD 551 is known to have caused drastic damage further east, and may have also contributed to the uplift. A recent tsunami associated with a volcanic eruption was that of the Colombo Bank volcano in AD 1650 that produced waves 20 m high on the coast of Thera. Devastating earthquakes occurred even more recently in the Cyclades in 1956, Corinth in 1961, and Kalamata in 1986.

Ecology

Greek ecosystems go back to the Tertiary period, several million years ago, when the climate was much wetter than today and the predominant vegetation was probably evergreen forest. These subtropical "laurisylvan" forests perished in the cold, drought, and fire of the Quaternary period, but their rustle and scent still faintly echo and breathe in the laurel and arbutus jungles on the north sides of west Cretan mountains.

Mediterranean ecology is determined partly by its history. For most of the last two million years Greece was colder and drier than it is now, the local effect of the glaciations of higher latitudes. Mediterranean-type plants retreated to favourable localities. The predominant vegetation was steppe-like grassland, sometimes with scattered trees. Forests were very local. Endemic plants – those confined to Greece – had nowhere to retreat to, and presumably sat out the glaciations on or near the mountains and gorges where many of them now grow. Significantly, very few endemics are forest plants.

Hundreds of thousands of years of cold and drought were interrupted by periods of thousands of years of climate more like the present. The present such interglacial began some 14,000 years ago. In the first half, Greece was populated mainly by deciduous trees like those of central Europe today: deciduous oaks, lime, alder, hazel, and even such a northern tree as birch. These indicate a wetter, probably less seasonal climate. From the 5th millennium BC onwards, the climate changed to approximately the semi-arid present. Middle European trees died out or retreated to unusually cold places and what are now thought of as Mediterranean plants became dominant.

The soils of Greece are varied, but mostly rich in lime. Soils come from three sources: weathering of the underlying rock; material eroded and washed in from elsewhere; and wind-blown dust from the Sahara. Weathering and erosion have been more active at times in the past than they are now. Erosion has washed material off hillsides and out of gullies and the resulting deposits have built up most of the basins and river deltas which are the best agricultural land. Lack of soil precludes most agriculture but not wild vegetation: many forests in Greece, and some olive groves, grow out of pockets and fissures in bare limestone.

Greece has always had browsing animals. Elephants and other great tree-breaking beasts were probably exterminated

by Palaeolithic men, and do not appear in this interglacial. Deer, wild oxen, wild swine, and smaller herbivores such as hares survived into historical times. From the Neolithic onwards, people have replaced wild herbivores by domestic livestock. Each species of animal has its likes and dislikes: goats, for example, are fond of prickly-oak (despite the prickles) but will not eat pine unless they have to. How the impact of wild beasts differed from that of domestic animals is not known: we do not know how many deer there were in aboriginal times, still less what they ate.

Crete, and probably the other islands, tells a different story. It had tiny elephants, mini-hippopotamuses, and slow deer, but no carnivore fiercer than a badger. Lacking predators, these animals would have produced a state that a modern ecologist would regard as excessive browsing. The transition after human settlement to an island dominated by sheep and goats may have had less effect than on the mainland.

Fire is a major ecological factor. Every summer there are countless wildfires in Greece, which are regarded as an abnormality and a tragedy. In reality trees and plants are combustible not by misfortune but by adaptation. They burn because they make flammable oils and resins; it is their business in life to catch fire (by lightning or otherwise) and burn up their less fire-adapted competitors. Some survive a fire by their thick bark or well-insulated growing points; others perish but come again from seed.

During the Neolithic and Bronze Ages the landscape was affected both by increasing human activity and by a change to a drier climate. People grubbed out (uprooted) forests on good soils to create farmland; on the remaining roughland they replaced the native mammals by goats, sheep, and cattle. Forests retreated to places with moisture or good root penetration, being replaced by maquis or savanna. Undershrubs benefited from the changes to establish areas of phrygana. The date, nature, and consequences of deforestation are controversial, but there is no good evidence that Classical Greece was more wooded than Greece is today.

These changes had more effect on some groups of plants than others. Cliff plants were little affected. Plants requiring deep soils were almost annihilated by agriculture, which changed the balance of the vegetation. Part of the reason why Greece is now thought of as a land of evergreen trees is that deciduous trees, especially oaks, grew on soils suitable for cultivation and were thus subtracted from the landscape: in recent decades, as cultivation has retreated, they have recovered some of the lost ground.

By Classical times the ecological changes were largely completed. Mostly the landscape looked not very different from Greece today, leaving aside urbanization, road making, and bulldozing. One important difference is the disappearance of fens, mostly destroyed in the 19th century. Another factor that the modern visitor may not appreciate is the great historic importance of woodcutting. Most Greek trees (even some conifers) sprout when felled and form coppice stools. In many areas wood was scarce, and even on cliffs trees were repeatedly cut down, and repeatedly sprouted, down to the mid-20th century.

In the last few decades, as land uses have been concentrated and intensified, much land that was once farmland or pasture has been abandoned. Woodcutting has almost disappeared: such firewood and charcoal as are still used come mainly as a by-product from an increasing area of olives and walnuts. Greek vegetation is very resilient, and the result is a great increase in the quantity of natural vegetation. Terraces become roughland, maquis grows up into forest, rivers are lined with jungle, and savanna becomes infilled into forest. One consequence is an increase in fires, since much of the new vegetation consists of pines and other fire-promoting plants.

Economy

The modern concept of a national economy is far removed from the origins of the term itself. Modern economists have developed abstract and analytic concepts and built up mathematical models to measure and quantify economic activities. Gross national product, inflation, and levels of employment are all criteria which are used today to analyse a country's economy. Such criteria cannot easily be applied to ancient Greece, so that economic quantification often proves controversial or elusive.

The discipline of ancient and modern economists differs in many ways. Modern study of the ancient Greek economy was transformed by the publication of M.I. Finley's *Ancient Economy* in 1973. To understand the economy of ancient Greece, and to consider the economy in the Hellenic tradition, we must embrace the changing attitudes towards our understanding of the Greek economy.

The word "economy" derives from the ancient Greek term *oikonomia*. In antiquity *oikonomia* had a meaning different from that of "economy" as we understand it today. *Oikonomia* was far more closely associated with the organization and management of the household (*oikos*). The use of the word later extended beyond its strict application to the household but there is only limited evidence to suggest that the "national" economy was considered. The ancient Greeks had no developed literature on or theory of economics. Xenophon's *Oeconomicus* is concerned with running the household and estate of a wealthy citizen; his *Poroi* (Resources) discusses ways of increasing revenue for the city, but is limited in explaining the means by which such improvements might be made. The *Oeconomicus* attributed to Aristotle is a collection of anecdotal stories about fundraising and the use of money, with minimal analysis of economic systems. Finley sought in vain for discussions and conscious theorizing about economics in ancient literary sources.

In ancient Greece the principal economy was that of the household. This was predominantly a rural economy. Agriculture was supplemented by the raising of livestock and in some areas by fishing. Other spheres of economic activity are also discernible. The Greek ideal of self-sufficiency (*autarkeia*) was aspired to but rarely achieved. Not all communities were able to provide all their own produce from their local rural environment. As a result, produce, among other things, was traded over varying distances in order to provide communities with the goods that they required. This trade existed on different geographic scales – local, regional, and international. Not all communities needed to rely on long-distance trade or had populations large enough to make demands beyond their immediate region. In this respect, Athens was exceptional among Greek communities not only for the large size of its population but also for its need to supplement its large domestic produce with the import of agricultural produce from abroad.

The primacy of the rural economy in ancient Greece appears as only one dynamic element in what is emerging as a complex picture of the economies of ancient Greece. The function of slaves and of non-slave labour, the role of money and coinage, the social behaviour and value systems of the urban elites in ancient Greek communities, the role of religion and temple economies, the importance of natural resources (mineral, geological, and timber), the dependence on maritime transport, and the significance of war, are all essential factors to be taken into account in understanding ancient Greek economies.

The ways in which the economies of ancient Greece have been approached in recent years have changed, and the different methods of analysing them have shed light on their nature. The established views of the past are being rejected in favour of more contextualized views of economic activities in ancient Greece.

Distinctive spheres of activity in ancient Greece can be labelled "economic" in so far as they related to the use of money, affected the finances and distribution of resources in the community, or dictated or involved the role of wealth. But understanding these spheres of activity is now seen as impossible unless their social, political, and cultural context is also taken into account.

Traditionally, students of the ancient Greek economy have been divided into "primitivists" and "modernizers". The primitivists have concentrated on the wider activities of society, paying less attention to the small minority, the elite, who have tended to dominate the surviving source evidence. The modernizers, by contrast, have tended to overestimate the importance of the elite and neglected the interaction of the numerically greater sectors of society. This polarization of approaches makes it impossible to see how all levels of Greek society interacted.

Another feature of the debate on the ancient Greek economy has been a distinction between the approaches of the substantivists and the formalists. The substantivists believe that the ancient Greek economy, while not as sophisticated and developed as the modern economy, betrays features and rationales which can be isolated and analysed independently of their socio-politico context. By contrast, the formalists believe that the ancient Greek economy was not only less developed than the modern economy, but was embedded within society. The ancient economy can be understood only in terms of social and political relationships. Movement of goods, for instance, may not have been motivated by economic gain, but by considerations of reciprocal gift-giving.

There has been a move away from these two sets of polarized approaches towards a more comprehensive and pluralistic understanding of the ancient Greek economy. It is more accurate to speak of ancient Greek economies, since there was no monolithic Greek economy. Greece never existed as a single cellular entity but consisted of many different communities which interacted individually with the communities and peoples of the Mediterranean and beyond. The economy of ancient Greece should therefore be seen as numerous interrelated dynamic economic activities. These activities sometimes involved only some segments of or groups within a community, and at other times affected the whole community.

The central importance of agriculture to Greek communities led to the movement, often over large distances, of both essential and luxury items. Trade in grain in antiquity is a feature of political and economic history. Athens in the 5th and 4th centuries BC had developed such a large population that there was no guarantee that the large supplies of grain from Athenian territory, including the important islands of Lemnos, Imbros, and Skyros, could provide for the city. In some years a shortfall in domestic production would have signalled shortages in Athens. The demand for grain stimulated an increase in the movement of merchants to Athens. Virtually all the grain supplied to Athens arrived by sea. This ensured that the Piraeus, Athens' harbour, prospered and attracted numerous foreigners and traders. While it would be unfair to say that the economic prosperity of the Piraeus grew out of the trade in grain, the movement of staple crops obviously provided an essential commodity to a highly demanding market. In the 5th century BC the growth of the Athenian empire had the important effect of providing considerable security for maritime transport in and around the Aegean. The loss of its empire by the end of the 5th century BC forced Athens to rely much more heavily on foreign alliances and institutional or legal reforms to regulate and control the movement of grain to the city.

For Athens, the most developed of the Greek polis economies, much more evidence exists for the use of credit and the role of banks and moneylenders than exists for any other ancient Greek community. Banking played an important role not only in financing maritime commercial enterprises but in all kinds of economic activity. Financial confidence was often entrusted to ad hoc groups of individuals who would act as guarantors of capital. Many surviving documents, the majority in the form of inscriptions on stone, provide information us about the use of security and capital.

Unlike many communities, Athens had the advantage of enormous wealth in its silver mines. The extraction of silver from the hills of Laurium provided the city with the raw material with which it manufactured its famous silver coinage, characterized by the owl stamped on the coin. The Athenian owl became a symbol of a guaranteed high-quality silver coinage. Its circulation during the 5th and 4th BC centuries was greater than that of any other Greek coin. The silver mines of Attica therefore played a huge role in promoting the economic welfare of the city.

The extraction of silver from Laurium depended on slave labour. Many Greek communities relied on unfree labour for their workforce. The very different and almost exclusively agrarian-based economy of Sparta was founded upon the peasant workers, the helots, who were subordinate to the Spartans. In Athens too the slave labour force which worked in the Laurium district was an essential part of the mining economy. Slaves played an important role in other areas of life. In Athens, however, it is less than certain that all farms would have used slave labour. Unlike Sparta, with its subjugated helot workforce, the typical Athenian farm was probably a small-holding providing at least sufficient produce for the household. Slaves worked in many other areas – in industries such as shieldmaking,or in crafts such as painting pots, for example, and in construction, such as on the building projects of the Acropolis in the 5th century BC.

But the economies of Greek communities also exploited a more fluid population of non-citizens: foreigners. In Athens, resident foreigners were designated as "metics" and would pay a special tax. In other commercial centres also foreigners played an important role, such as on Delos, Rhodes, and in Corinth. It was normal that only citizens could own land in a Greek city; foreigners were sometimes granted the right to do so, but only as a reward for services to the city. The non-citizen population of the Greek city was highly fluid and transitional. Warfare and economic depression would probably see falls in this mobile population. Some cities, including Athens, had sufficiently large foreign populations to establish foreign cults and maintain a more permanent community.

Religion and warfare were of central importance to the economies of the Greek world. Religion, centred on the worship of gods in temples, encouraged the rise of temple economies. The built temple often served as a storehouse for the wealth and dedications offered to a god. The temples of Apollo at Delphi and Athena at Athens contained vast amounts of wealth at the heights of their success. Revenue from the cities of the Athenian empire was hived off as offerings to Athena in her temple on the Acropolis, and the monies dedicated to her from Athens' allies were recorded on stones and displayed outside the temple (the so-called Athenian tribute lists). The role of the temple in the movement of wealth and as a repository for wealth which could be used by a Greek city is best illustrated by Pericles' statement of the Athenian financial reserves at the opening of the Peloponnesian War (Thucydides, 2. 13. 2–6).

One of the greatest drains on the economic resource of a Greek community, and particularly a city, was warfare. The citizens of the polis in the Archaic and Classical periods typically provided the main infantry fighting force for the army. This minimized the expenditure a community had to meet for sending out a military force. The expense of warfare put an immense strain on many communities. In the 5th century BC Athens spent more on warfare than any other city. The cost of running a navy of 100 or more ships was huge. The services that the wealthiest Athenians were required to perform on behalf of the city included trierarchy – providing for the equipping and manning of warships – which helped to reduce the cost to the city of maintaining a fleet. For many Greek cities such expenditure was impossible. The other great expense of warfare was the cost involved in building and maintaining the defences of a community, in particular the cost of building city walls. Emergency taxes were sometimes required to meet the cost of military operations; special taxes were on occasion imposed if defences were required hastily. Expenditure on civic defence was large, as was the cost of providing patrols and mobile defence forces such as cavalry. Cavalry power was often provided by the wealthiest citizens of any community; the cost of maintaining a horse throughout the year was high. Despite the dependence on the wealthy elite to defray some of the expenses of warfare, it was inevitable that many cities relied on their own finances to pay for military activities. The use of the financial reserves of temples was central to providing money to the city.

The economy of the Greeks in later periods, such as the Byzantine era, continued to be based on agriculture. Even in times of wider economic depression, the supply of agricultural produce was often sufficient to support a local economy. The Byzantine state played a major role in the economy of this period, raising money through taxation and paying out vast sums for its army and bureaucracy. On a local level signs of continuity are visible, but overseas trade was vulnerable to the fluctuations of the political world.

It becomes clear that the economic organization of ancient Greek communities differed in many respects from those of a modern state. Individuals and households were essential to the shaping of ancient Greek economies. In the same way, the community depended to large extent on the household and the individual for financial support of the city. Over time the smaller-sized community of the polis was overtaken by the much more richly endowed political systems of the kingdoms which dominate the Hellenistic period. The Roman domination of the Mediterranean illustrates the rise of an even greater power than the Hellenistic kingdoms. Despite the changing shape of the political world, the economies of the Greek communities which made up the ancient world remained remarkably consistent and dependent on the household economy and the wealth of the richer individuals or elites within the community.

Ecumenism

Although a definitive lexical study of the words *oikoumene* and *oikoumenikos* has not yet been written, it is possible to distinguish, from antiquity to the present, at least seven meanings in them: (1) pertaining to, or representing, the whole (inhabited) earth; (2) pertaining to, or representing, the whole of the (Roman) empire; (3) pertaining to, or representing, the whole of the Church; (4) that which has universal or ecclesiastical validity; (5) pertaining to the worldwide missionary outreach of the Church; (6) pertaining to the relations between and unity of two or more Churches (or of Christians of various confessions); (7) that quality or attitude which expresses the consciousness of and desire for Christian unity.

The term, derived from *oikein* (to inhabit), has been used since Herodotus; and in the Hellenistic period it found application in secular contexts, where it referred politically to the realm of the Graeco-Roman empire or to the civilized world in cultural contradistinction to the lands of the barbarians.

Biblical writings generally follow the secular usage, taking *oikoumene* as a synonym for "earth" (Ps. 23: 1, LXX), yet without giving particular prominence to the term. In the New Testament its political connotation is observable in Luke 4: 5–7 (cf. also Luke 2: 1; Acts 17: 16) and in the Apocalypse (esp. 16: 14). For the writer of Hebrews, the expected reign of God can be called the "*oikoumene* to come" (2: 5).

The subsequent, much more widespread, ecclesiastical use of the term is linked with the extension of the Greek-speaking Christian community across the entire Roman empire. By the 4th century the *oikoumene* had become the "Christian world", with the double (political and religious) meaning of the "Christian empire" and the "whole Church". The adjective *oikoumenikos* refers to everything that has universal validity. Thus, "ecumenical" is a quality claimed for particular councils and their dogmatic decisions. It is also used as a title of honour for specific patriarchal sees or for respected teachers of the whole Church. In the Orthodox tradition, which preserved the memory of the early link between Church and empire, the term remained in use, though its meaning became more and more specific. Today it serves to describe the new reality of the organized ecumenical movement, as represented in particular by the World Council of Churches (established in 1948), and the different ways of reacting to this reality.

The Orthodox Churches have participated actively in the ecumenical movement from the beginning. Indeed, an encyclical from the ecumenical patriarchate to the sister autocephalous Churches in 1902 inaugurated the journey of Orthodoxy towards dynamic dialogue, conciliation, and cooperation in order to respond more fruitfully to the urgent need of reuniting fragmented Christianity. This encyclical was the first document to raise at an official level the issue of relationships, first, between Constantinople and the Oriental Orthodox Churches and, secondly, between Orthodoxy and Western Christendom, in an ecumenical perspective.

A second, landmark encyclical, issued in January 1920 from the Phanar and addressed to "all the Churches in the *oikoumene*", introduced a fundamental programme of contemporary ecumenism and called for the formation of a "league of Churches", to be modelled on the newly established League of Nations. The document laid down two essential conditions on which rapprochement and fellowship could be achieved: (1) the elimination of "mutual distrust and bitterness between the different Churches", and (2) the rekindling and strengthening of love among them. This letter signified a departure from the usual cautious attitude of the Orthodox towards the West, and showed the desire of some at least among their hierarchs to take the lead in the movement towards closer fellowship.

As an outcome of this remarkable change of mind, a large delegation came to Geneva (12–20 August 1920) to the preparatory Conference of the Faith and Order movement. Three of these delegates were also present at the preparatory

meeting of the Life and Work movement, which took place in Geneva at the same time. For many of the Orthodox delegates, this was the first occasion of meeting with representatives of non-Orthodox Churches, and the initial contacts were not always easy. Some of the Orthodox were particularly troubled by the proselytizing missions supported by certain American and British groups, and made the cessation of all such activities the condition for their further cooperation. In spite of these tensions, the impression produced upon the Orthodox by the leaders in Faith and Order was highly favourable, and convinced a number of them of the sincerity and genuine desire for unity animating many representatives of these new endeavours towards reconciliation.

Two major attempts at achieving reunion between the Greek East and the Latin West took place at the Second Council of Lyons in 1274 and the Council of Florence in 1438–39. But in both cases, although a formal union was promulgated, it was ultimately rejected by the general Orthodox population. Centuries of mutual isolation and hostility ensued, with each Church de facto denying the ecclesial reality of the other.

The situation began to improve only in the 1960s, when important changes in attitude took place within both the Catholic and the Orthodox Churches. From the Catholic perspective, the convocation of the Second Vatican Council with its Orthodox observers marked a greater openness to the East. From the Orthodox perspective, the third Pan-Orthodox Conference (Rhodes, 1964) encouraged the local Orthodox Churches to engage in studies preparing for an eventual dialogue with the Roman Catholic Church.

Two other notable events took place in the same decade. In January 1964 pope Paul VI and the ecumenical patriarch Athenagoras met for the first time, in Jerusalem. In a common declaration issued by them on 7 December 1965 the mutual excommunications of 1054 were "erased from the memory of the Church". In 1967 the pope and the patriarch exchanged visits in Rome and Constantinople. Between 1980 and 1990 six official meetings of the Joint International Commission for theological dialogue between the Orthodox Church and the Roman Catholic Church were held. This dialogue is still in its early stages, but progress is being made in the effort to establish a common foundation, on the basis of which the more difficult issues, especially the role of the Church of Rome and its bishop among the local Churches, can be most fruitfully discussed.

The first official international dialogue between the Orthodox Churches and the World Alliance of Reformed Churches took place in 1988 in Leuenberg, Switzerland, under the leadership of the metropolitan Panteleimon Rodopoulos (ecumenical patriarchate) and Dr Lukas Vischer (World Alliance). The second was held in Moscow in 1990.

Behind these meetings lies a long history of Orthodox and Protestant contacts. The earliest exchange of letters took place between the Lutheran theological faculty of the University of Tübingen and the ecumenical patriarch Jeremias II from 1573 to 1581. For the Calvinists, the first Orthodox–Reformed discussions centred on the stormy debate over the "unorthodox" confession of faith of the ecumenical patriarch Cyril Lukaris (ruled 1620–38). In the light of this history both groups consider it essential to establish firm grounds on which both traditions can confess the essentials of their Christian faith in common. Hence the decision for the official international dialogues to focus on the doctrine of the Trinity, based on the Nicene Creed.

Education

The poems of Homer depict aristocratic youths attending their seniors much in the manner of esquires attending the knights of the western Middle Ages. There was doubtless a similar educational purpose, both in teaching skills of warfare and in inculcating heroic *arete* (valour). Apart from the long list of the centaur Cheiron's students (which gave rise to the lost Hesiodic *Praecepta Chironis*), the tale of Phoenix's instruction of Achilles (*Iliad*, 9. 432–619) involves the employment by a father of a private tutor. His noble birth possibly foreshadows (unless it is a later ad hoc invention) a formal institution known among the aristocracy of some states in the Archaic and Classical periods, when it involved a strong pederastic element. In this institution an older man courted (in Crete abducted) a youth whom he initiated into all aspects of civic life.

Other poets too were a major early source of education for the Greeks but although they did give practical information they, like Homer himself, were regarded chiefly as teachers of ethical ideals. Although their position was assailed by philosophers (first as early as the 6th century but most notably by Plato), it survived to the end of the Classical period. Thereafter the poets were read more for their artistry. Homer's paramountcy (and longevity) is marked by the commentary of

Eustathios, a 12th-century bishop of Thessalonica, which is the lengthiest commentary ever written on any ancient author.

The earliest formalized education in the Greek world was probably the Spartan *agoge* (training). Though attributed to a single early enactment, this was probably a gradual development resulting from the need for internal self-defence by the vastly outnumbered Spartiates. By the Classical period it certainly involved the compulsory, state-run education of males from the ages of 7 to 29. Since the aim was military preparedness, it gave minimal attention to literacy and maximum attention to training for war through sport and dancing as well as mock fighting and hunting. Toughness was attained through starvation, inadequate bedding in winter, and sleeping rough (excesses of severity, such as the whipping competitions that could lead to death, belong to the Roman period). Girls were given a similar but less rigorous training. A gentler and briefer Athenian analogue was the 4th-century *ephebeia*, which gave primarily military instruction to youths who entered barracks (as at Sparta) in their eighteenth year. No longer compulsory by 305 BC, the two years of service were reduced to one in 282 BC, and thereafter the *ephebeia* became increasingly pacific. Except in Macedon, where ephebes continued with strictly military training until 168 BC, parallel institutions in other cities degenerated into young gentlemen's associations, but in places lasted until the 4th century AD.

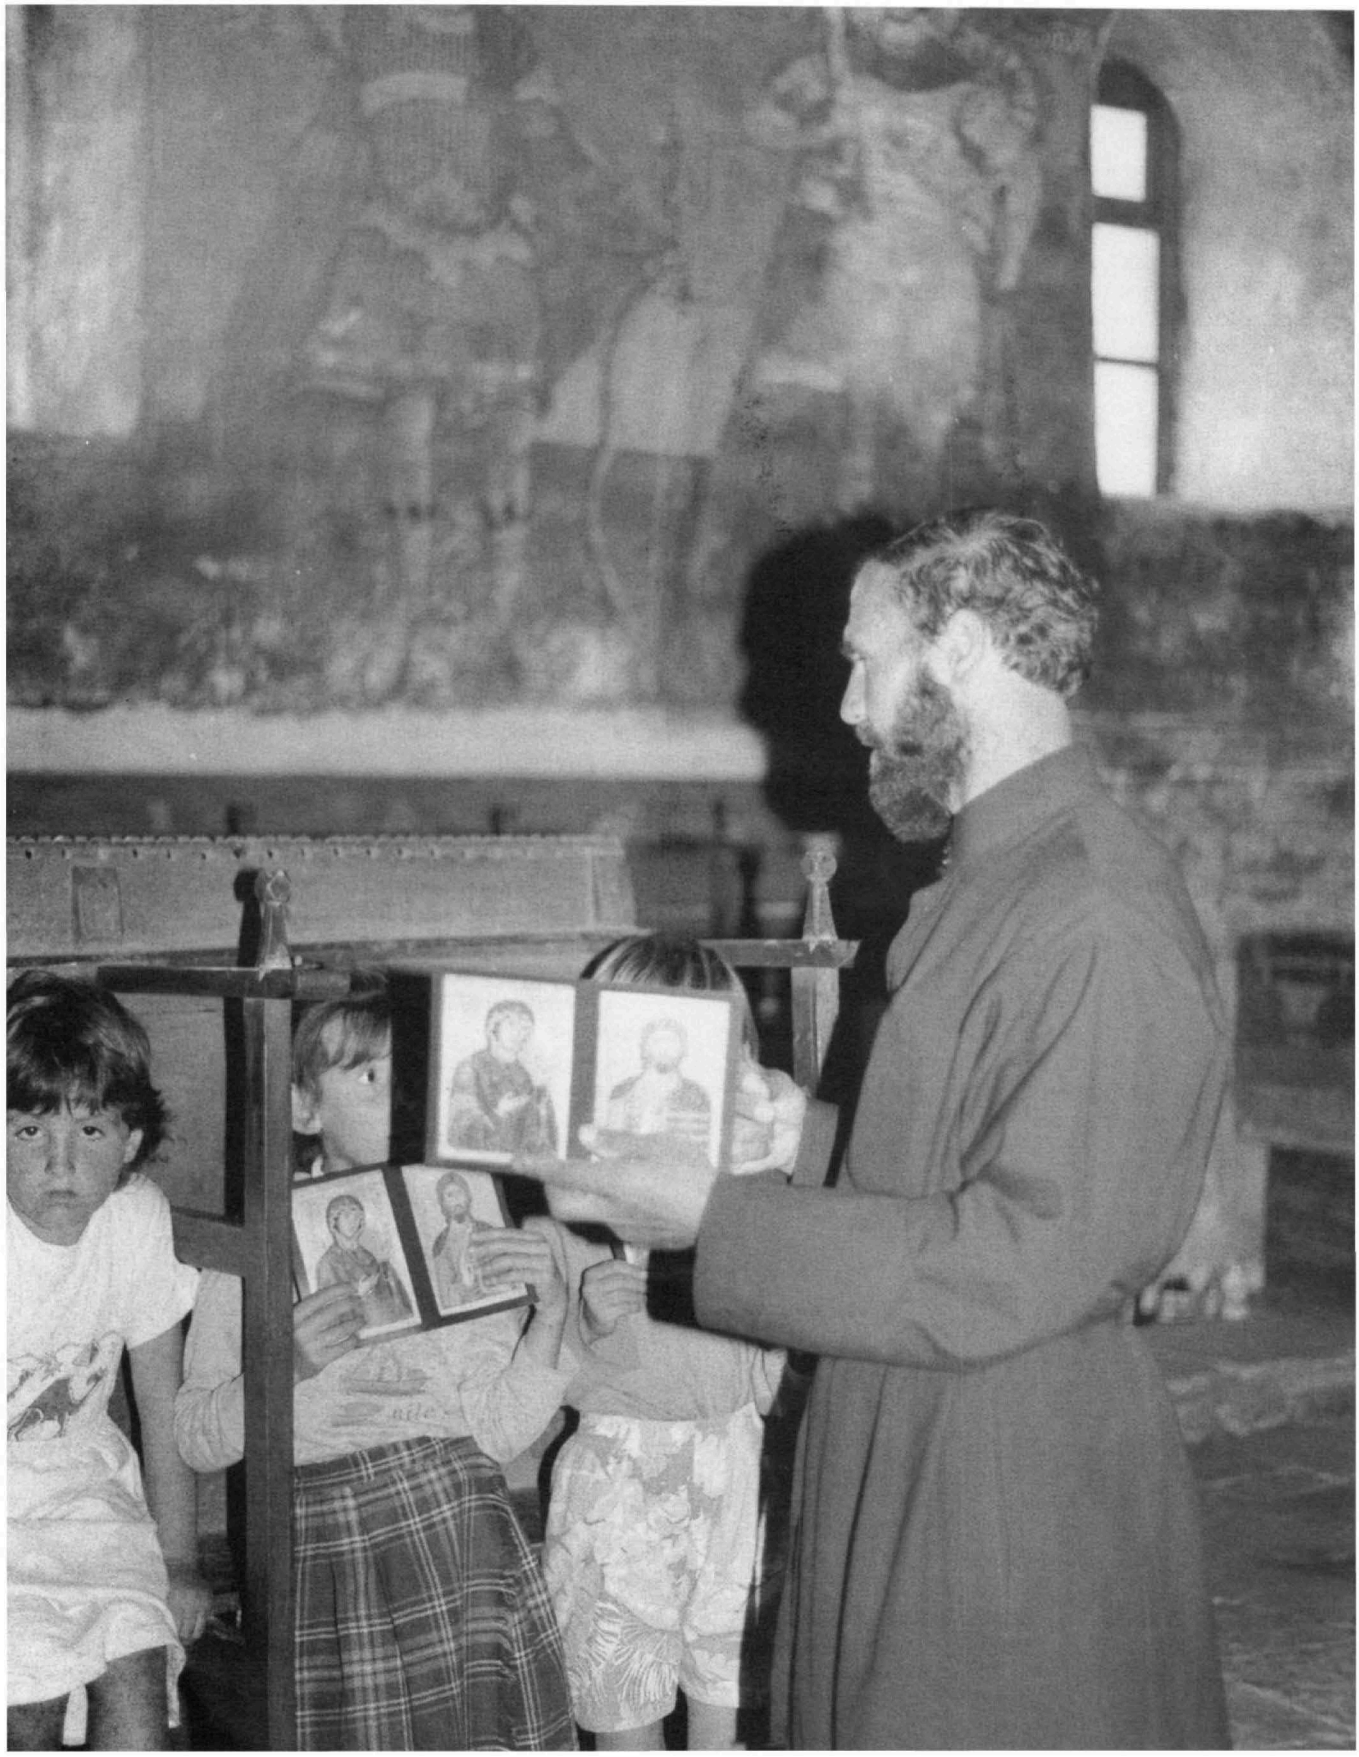
It is not known when private group schooling came into existence. The earliest schools reliably mentioned were at Chios (Herodotus, 6. 27) and Astypalaea (Pausanias, 6. 9. 6) in the 490s BC and at Troezen (Plutarch, *Themistocles*, 10) in 480 BC. The number of schools grew throughout the Classical period even in small cities (Boeotian Mycalessus must have possessed at least three schools in 413 BC, because Thucydides [7. 29. 5] reports the slaughter by Thracian mercenaries of all the boys in "the largest one"). The early, aristocratic emphasis was on gymnastics and music, the latter constituting poetry, dancing, singing, and the playing of an instrument (by the early 4th century BC the lyre had ousted the *aulos*). It is not known if there were any schools for literacy in the early part of the 5th century, but by its end these predominated.

Most of the information known about Classical education is 4th-century BC Athenian. Boys (and girls according to the evidence of vase painting) attended – but not necessarily all of – the usually separate schools of the *paidotribes* for gymnastics, the *kitharistes* for music and lyric poetry, and the *grammatistes* for reading, writing, other literature, and arithmetic. At the end of the Classical period Sicyon introduced drawing into the artistic curriculum. Teachers were freemen, sometimes with slaves as assistants, poorly paid and held in low regard. Boys were accompanied to school by a *paidagogos*, a trusted slave responsible for behaviour and moral upbringing. Lessons were learned largely by rote and encouraged by the cane and regular public competition (Plato (*Laws*, 819b–c), approvingly mentions arithmetical games). Holidays coincided with festivals.

Higher education was provided in the last third of the 5th century BC by sophists, itinerant teachers who lectured for a fee on a wide range of subjects. Hippias' professed expertise in arithmetic, geometry, astronomy, and music is the origin of the western medieval quadrivium, while Gorgias' instruction in Sicilian techniques of rhetoric transformed prose writing and ultimately the future direction of education. In the 4th century BC Isocrates and Plato opened schools, the former to all who could pay the fee, the latter only to chosen students. Both men were influential educational innovators (Plato in part through the utopian theories of his *Republic* and *Laws*). Isocrates' aim was to produce future political leaders, primarily through rhetoric, a subject that Plato was late in allowing at his Academy, where philosophical and mathematical studies were supreme. Plato's insistence on propaedeutic courses in geometry and his use of specialist teachers may be seen as the origin of secondary education, while his scientific interests inspired Aristotle, his pupil of 20 years, to open a school of his own (the Lyceum) in 335 BC where the natural sciences were vigorously pursued.

During the Hellenistic period there was both a huge expansion and a definitive formalizing of education that extended to the introduction of examinations. Whereas Diodorus Siculus' claim (12. 12. 4, 12. 13. 3–4) that Charondas deemed literacy so important that he legislated for universal education at public expense is a muddled retrojection (to the 6th century BC, and a transplantation from Catana to Thurii that was founded in 444/43 BC), Teos, Miletus, and Rhodes now certainly received huge benefactions that made universal education (for boys) a possibility, while elsewhere schools were regularly subsidized by the municipality that itself contracted the teachers. Education for girls definitely expanded, and evidence suggests that even slaves were occasionally allowed schooling (there is firm later documentation from Graeco-Roman Egypt). All children's educational activities, including gymnastics and music, were now concentrated into a single building. The age of entry to primary school varied: the Stoic Chrysippus, who emphasized the pedagogic importance of well-spoken nursemaids, suggested three, Aristotle five, and Plato six, but seven was more normal. Writing materials were more readily available and tablets with copied exercises survive. Literacy was taught through letters, syllables, words, and finally short continuous passages that were always difficult to read for lack of word division. Memorization was still dominant. Arithmetic involved little more than counting. Secondary education was largely for the study of Classical literature under the *grammatikos*, but a general education (*enkyklikos paideia*) of mathematical subjects, astronomy, and music played a minor role. Higher education in literature, rhetoric, and philosophy was available in many larger centres, but most of the best teachers worked in Alexandria, Athens, and Pergamum. Medicine was taught chiefly at Alexandria, Cos, Ephesus, and Pergamum.

Roman education was closely patterned on Greek: any Roman with cultural pretensions was bilingual; Roman aristocrats employed Greek-speaking tutors for their children; some if not all of the earliest Roman schools taught Greek; and the curriculum of the Latin schools was based on the Greek. The main changes in the Greeks' own education was the introduction of the study of grammar in its own right in the 1st century BC through the influence of Dionysius Thrax, the deliberate choice of an archaizing form of the language increasingly distinct from that which was spoken, and an increasing emphasis upon rhetoric. This latter involved training in often extemporary forensic and epideictic oratory, the analysis of numerous kinds of speeches, and the formulation of strict rules for them. During the Second Sophistic (*c.*AD 60–410) declamatory



Education: Vlach priest giving religious instruction to some Vlach children at Voskopoje in eastern Albania

displays became a major form of entertainment (and tool for the recruitment of students).

Christian emphasis on God's written revelations and the need for their interpretation fostered literacy in the Byzantine world (Maximos Planudes' complaint that it was not lucrative is satirical). Despite periodic monastic attacks, pagan literature continued to form the base of secular education: its defenders claimed that it was allegorical, foreshadowed Christianity, or that its resplendent form should be imitated even if its content was rejected (see St Basil's *Address to Young Men*). Persecution for paganism (most notably of John Italos in the 11th century) was remarkably infrequent and mild. Scientific subjects, however, were not usually encouraged.

In the early centuries of the Byzantine empire there was little change in education, schools being largely a municipal responsibility. Privatization after the 6th century AD resulted, however, in a drastic reduction in their number. Although the occasional small elementary school still existed, most children were taught reading, writing, arithmetic, and some knowledge of the Bible by their parents, or by priests, notaries, or other literate persons (Michael Psellos praises his mother for the rudiments of his own education). Monastic schools satisfied the needs of illiterate novices and sometimes accommodated lay children. Formal secondary education was also rare and usually a matter of private arrangement. At this level the emphasis was upon Classical literature and grammar (though not of the spoken language) with occasional forays into subjects of the quadrivium. With the revival of learning in the mid-9th century a school was opened at the Magnaura Palace and later emperors sometimes subsidized private schools. An illuminating collection of letters by an anonymous Constantinopolitan teacher of the 10th century deals with the school programme, teaching methods (including the use of older boys to instruct younger ones), truancy, behavioural problems, and struggles to extract from parents the fees that he was forced to supplement by the copying of manuscripts. Thomas Magistros in the early 14th century emphasizes the importance of choosing teachers both knowledgeable and of good character.

Institutional higher education was sporadic and information on it is both vague and occasional. The Neoplatonic Academy of Athens was the centre of pagan studies (apart from a brief period of Alexandrian superiority around AD 500) and survived, albeit probably for only a few decades, the ban imposed by Justinian I in AD 529 on the teaching there of philosophy and law. Theodosius II established (or reorganized) at Constantinople in AD 425 a "university" with 31 chairs, mainly in Greek and Latin but including philosophy and law. Its demise, probably in the late 6th century, is obscure. Constantine VII's school in the palace in the mid-10th century may have involved higher as well as secondary education. In 1047 Constantine IX established a law school and shortly thereafter one for the teaching of rhetoric and philosophy that was headed by Michael Psellos, from whom survive various short works addressed to his students. In 1107 the Patriarchal School was organized (its possible earlier existence is a contentious issue) in Hagia Sophia for the teaching of theology, but by the middle of the century rhetoric had been added. In the 1440s the scholars Michael Apostoles and John Argyropoulos, both of whom were interested in rhetoric and philosophy, are known to have taught at a school attached to the Xenon of the Kral of the Petra monastery in the capital. Medical schools were sometimes attached to hospitals. In addition up to *c.*1300 many Byzantines and foreigners sought higher education from private teachers mainly, but not exclusively, in Constantinople.

Outside the Greek-speaking areas Byzantine culture and education were exported, largely through churchmen and with profound effects still very evident at the end of the 20th century, to the countries of the Caucasus, throughout the Balkans, to the Kievan Rus, and later to Moscow. Many foreigners, most notably Symeon the future tsar of Bulgaria, were educated in Constantinople itself. Arab courts openly solicited Byzantine scholars and were far more receptive to their knowledge than Byzantines were to the Arabs'. Many aspects of both Seljuk and Ottoman cultural life were modelled on that of the Byzantines. Scholarly émigrés mainly from Constantinople, beginning with Manuel Chrysoloras in the last decade of the 14th century, had more to do with the Renaissance than westerners usually admit.

In the first few decades after the fall of Constantinople in 1453, poverty was primarily responsible for the small number of schools for the Greek inhabitants of the Ottoman empire; but the situation was never as dire as some intellectuals thought, who went so far as to question the very survival of the language (some Greeks in Asia Minor, the so-called Karamanli Christians, did, however, adopt Turkish, though writing it in the Greek alphabet). Even higher education did not entirely disappear, because the Patriarchal Academy was restored by Gennadios II Scholarios, and taught rhetoric and philosophy in addition to theology, while there are hints of private individuals teaching at Thessalonica, Adrianople, and elsewhere. Most children in rural areas, and even in many towns, gained what knowledge they did orally at home and at church. Schooling was rudimentary and available in many areas only at the local monastery where many of the monks were themselves illiterate (Athos, nevertheless, enjoyed several genuine intellectual revivals). In time, however, a few communities benefited from schools and libraries financed by natives who had improved their lot elsewhere. All Greek education was the responsibility of the Greeks themselves and not of their Turkish overlords. Indeed there was sporadic Turkish oppression of Greek education, dependent increasingly upon the whims of local pashas and beys; and until the late 17th century many of the more intelligent (and good-looking) Christian boys were taken away at an early age through a levy (*devshirme* or *paidomazoma*) to be trained as soldiers or civil servants. Outside the areas of Ottoman rule the situation was better, especially in the Venetian-ruled Ionian islands and Crete, from which the sons of the wealthy flocked to Italy, and in particular to the medical school at Padua, where they were joined in the 16th century by Phanariots whose commercial activities had by then brought considerable economic success.

When Jeremias II reorganized the Patriarchal Academy in 1593 the various departments, which included some sciences, were all headed by Padua-educated Phanariots, whose acquired contempt for Byzantine traditions and collaboration with the Ottoman government created permanent distrust and antipathy between them and Greeks elsewhere under Turkish rule. To the north further centres of Greek culture, though

influenced by current western European trends, were established through the School of the Three Hierarchs at Jassy and the Bucharest Academy (founded in 1644 and 1679 respectively), which were made possible by the Phanariots' monopolization of the position of *hospodar* (prince) in Moldavia and Wallachia. After about 1750 the increasingly apparent decline of the Ottoman empire encouraged a revitalization of education among the Greeks, most dramatically shown by the astonishingly large number of books published (albeit mainly abroad). Intellectuals, most notably Adamantinos Korais, proclaimed that national consciousness entailed linguistic identity, a belief that engendered even an artificial language (katharevousa, literally "purifying") that rejected Turkish loan words and reverted to many Classical grammatical forms. Diglossia, which for the Byzantines had been purely cultural, was now, therefore, politicized (the Epirot Alexandros Pallis's demotic translation of the New Testament caused riots in the streets of Athens when it was published in 1901) and bedevilled education until the late 20th century. The peasantry, meanwhile, formed so many so-called "secret schools" for the preservation of both the culture and the language that at the outbreak of war in 1821 rudimentary literacy was fairly widespread.

For nearly a century and a half after independence was achieved few children advanced beyond elementary education, since the *gymnasia* (secondary schools), accessible only through examination, maintained rigorous academic standards with an emphasis upon arts subjects – and especially ancient Greek – and were primarily intended as preparatory to university. Eleftherios Venizelos (who in 1911 had made primary education free and compulsory) even reduced the number of *gymnasia* with a corresponding decrease of enrolment from 96,000 in 1928 to 57,000 in 1932. Moreover, instruction, until 1917 even in the elementary schools, was in the rarely spoken katharevousa rather than the *dimotiki* (demotic) of the majority of the population. All education was underfunded, highly centralized, and, partly through the influence of the Church, conservative.

The most important reforms of the late 1950s concerned the creation of both parallel technical-vocational schools and a separate and far less popular scientific stream for the fourth to sixth years of the *gymnasia*. Major reforms were made in 1964, largely at the initiative of the Minister of Education E.P. Papanoutsos, who had studied education (and philosophy) in Germany and France. Although these were swept away three years later by the military junta (which also purged atheist teachers and abolished corporal punishment in schools as "contrary to modern educational principles"), they were largely reintroduced at its demise in 1974. *Dimotiki* now became the medium of instruction at all levels, and three years' attendance at *gymnasia* (for a total of nine years of schooling) became compulsory, with ancient literature being taught only in modern translation. The final, optional, three years of secondary schooling involved two parallel streams at the General or Technical-Vocational *Lykeia*, of which only the former could lead to university, where education was now free. In 1981 the school week at both elementary and secondary levels was changed from six to five days, but with minimal diminution of hours. Subsequent reforms by socialist governments introduced greater democratization rather than structural changes. The OECD report of 1995 emphasized the need to dilute the rigid centralization of all educational policy-making.

In 1991 only 37.4 per cent of the population aged 25 and over had progressed past the elementary school level. Although total expenditure on public education was low at 3.7 per cent of GNP (1995), the student–teacher ratio at elementary schools dropped most encouragingly from 50:1 in 1955–56 to 24:1 in 1980–81 to 17:1 in 1993–94 with a large associated diminution in the number of single-teacher rural schools. In 1993–94 there were also 5588 non-compulsory pre-primary schools serving about 45 per cent of children aged between three and a half and five and a half.

The first modern tertiary-level educational institution on Greek soil was the Ionian Academy, opened under the British Protectorate at Corfu in 1824 (after an aborted attempt in Ithaca) largely through the instigation of Frederick North, 5th Earl of Guilford, who became its first chancellor (the earlier French Ionian Academy was a society of savants). It finally closed after a chequered history in 1864, having served mainland as well as Septinsular students. The oldest university established in independent Greece is the National and Capodistrian University in Athens, which from 1837 was the sole university in the country until the Aristotelian University of Thessalonica was opened in 1925. Since 1964, with one at Patras, small universities have been created elsewhere in Greece in addition to various other institutions of which some have university standing (in 1995 there were 18 universities, 12 technological educational institutions, and 61 higher professional schools).

Keen competition for places gave rise to numerous *phrontisteria* (expensive private tutorial schools), and still in the 1990s only one out of four applicants attained a place at university. Total enrolment at all institutions of tertiary education, however, increased from just over 120,000 in 1980–81 to nearly 300,000 in 1993–94, with almost half of 18-to-21-year-olds in some form of education, despite the labour market's inability to provide employment appropriate to qualifications. Efforts were made to combat the Greek predilection for arts subjects, which had surprised foreigners as early as the mid-19th century, by changing emphases at both secondary and tertiary levels. Nevertheless in 1993 there were still only 774 scientists and engineers and 314 technicians per million of the population, while Research and Experimental Development accounted for a mere 0.6 per cent of GNP.

Egypt

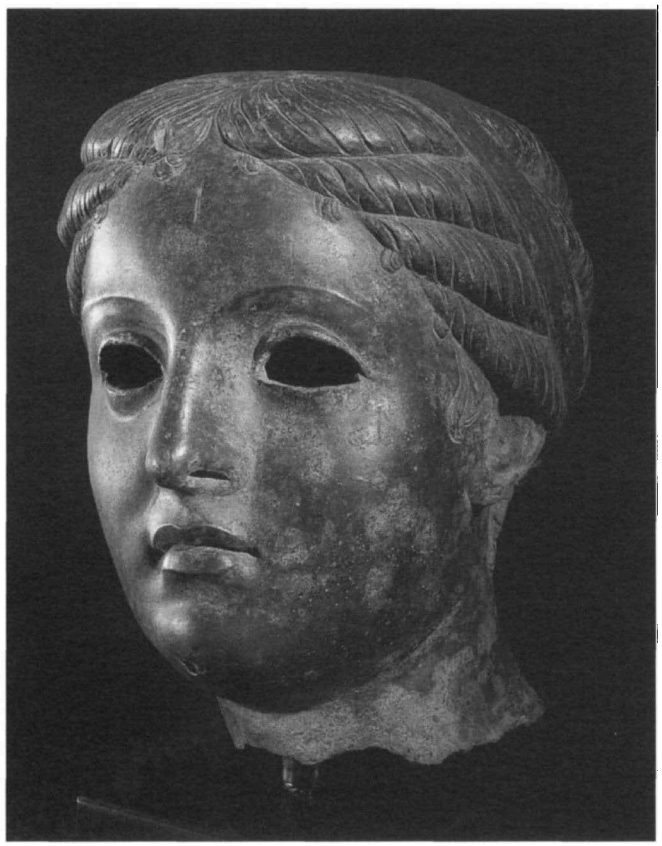
It was from the time of the New Kingdom (1550–1069 BC) that contact between Greece and Egypt became established. By that time Egypt was already a land of great antiquity with a flourishing native civilization. Over the years the Greeks established trade and political links with Egypt. Parts of the country gradually became famous centres of Greek civilization, coexisting alongside the ongoing native culture.

After a period of internal political instability in the 7th century BC, Egypt was reunited and stabilized during the reign of the pharaoh Psammetichus I (664–610 BC). Needing economic resources to make of Egypt the great nation that once it was, he developed a large-scale policy of trade relations with the Greeks and with the Phoenicians in the Levant. One very important result was the foundation of the Greek colony of Naucratis in the Nile delta, some 80 km southeast of the later Greek city of Alexandria, on the Canopic (or Rosetta) branch of the Nile. Naucratis was an important town in antiquity, though very little of it remains today. Excavations there have produced important finds of closely datable Greek pottery. In the 6th century BC the pharaoh Amasis permitted the Naucratites to levy taxes on imports and exports from river traffic, thereby ensuring their prosperity, and the Greek historian Herodotus, who wrote about Egypt in his *Histories*, mentioned various Greek temples in the city. During the reign of Amasis, the Hellenion, a Greek shrine, was established at Naucratis jointly by Ionian, Dorian, and Aeolian Greeks from the Greek islands and Asia Minor. The most famous native of Naucratis was the Greek writer Athenaeus (*fl. c.* AD 200), the author of the *Deipnosophistai* (*The Learned Banquet*), a highly important work relating supposed conversations at a fictional banquet lasting several days. It contains a wealth of antiquarian information and excerpts from a vast number of earlier, largely disappeared Greek texts. Greeks from all over the Greek world also came to live elsewhere in Egypt at this early period, many enrolling as mercenaries in the pharaonic armies.

Egypt was conquered by the Persian great king Cambyses in 526/25 BC and, though there were periods of revolt and independence, it remained an uneasy, far-flung province of the Persian empire (as such becoming a theatre of minor operations in the Peloponnesian War when Persia became involved in this Greek conflict) until the arrival of Alexander the Great in 332 BC. Alexander invaded and conquered Egypt in the course of his campaign to subdue the Persian empire. He was welcomed as an alternative to the hated Persian rule. Either before or after his legendary trip to the Siwa oasis in the Western Desert, where he visited the oracle of Ammon and allegedly sought recognition as the god's son, Alexander founded his first city named "Alexandreia", on the Mediterranean coast on the western branch of the Nile delta. It is at this point that we can meaningfully begin to speak of a Greek Egypt, although Alexander did not live to return there.

After Alexander's death in Babylon in 323 BC and the subsequent division of his empire, the satrapy (province) of Egypt came under the control of his Macedonian boyhood friend and later general, Ptolemy, son of Lagus. Ptolemy diverted the funeral cortege of Alexander (en route to Macedonia) to Egypt, burying the coffin first at the old dynastic capital Memphis (south of Cairo) and then in a magnificent tomb in Alexandria which later became the burial place of the Ptolemaic kings and the focus of their ruler cult. The site of the tomb has not been discovered.

Alexandria had functioned as a Greek city from soon after its foundation and, after Ptolemy declared himself king of Egypt in 305/04 BC, became the glittering capital of the Hellenistic empire, called Ptolemaic after his name. Over time Alexandria replaced Athens as the greatest city of Greek culture. The city was endowed with splendid buildings aligned on a grid system with wide thoroughfares, and it was proverbially wealthy in the works of contemporary authors. The Ptolemies actively encouraged Greek immigrants to Egypt. Many were merchants lured by the economic prospects of Alexandria (which soon became a great trading centre); others were professional soldiers given ownership of allotments of land (known as cleruchic land) throughout Egypt in return for their military service. The early Ptolemies actively fostered the development of the famous library of Alexandria, to which we can credit the preservation, copying, and transmission of much ancient Greek literature, and the Mouseion (literally "the shrine of the Muses"), a residential study centre for scholars which acted as a magnet for the greatest Greek writers and thinkers of the day.



Egypt: bronze head of queen Arsinoe III, sister and wife of Ptolemy IV, late 3rd century BC, Antiquarium Gallery, New York

Greek cities, many with Ptolemaic dynastic names such as Ptolemais, or Greek theophoric names such as Apollinopolis, grew up throughout Egypt. Important collections of Greek documents written on papyri (a writing material made from joined strips of the papyrus plant, native to Egypt and used for native Egyptian hieroglyphic writing for millennia) attest to a vibrant Greek lifestyle in many provincial areas of Egypt. The desert environment of much of Egypt is ideal for the preservation of papyrus, although little remains from the city of Alexandria or the rest of the Nile delta because of its comparatively moister climate. The Zenon, Tebtunis, and Oxyrhynchus collections of papyri, to name but a very few, have greatly increased our knowledge about the Greek way of life in Ptolemaic Egypt, and the interaction between Greeks and Egyptians, a very important subject for the question of the Hellenization of Egypt. Occasionally the papyri contain political insights, and fragments of hitherto lost Greek literature, most notably large sections of the plays of the 4th-century BC Greek comic poet Menander of Athens (which attests to his considerable popularity in Egypt). There are also private letters, wills, contracts, marriage agreements, and financial accounts, written both in Greek and in the native language known as demotic, with the result that we know much more about the private lives of the Greeks living in Ptolemaic Egypt than we do about Greeks elsewhere in the Hellenistic empires. It appears that the Greeks remained largely Greek, although many native Egyptians tried to assimilate themselves by learning the Greek language, and adopting the veneer of a Greek way of life in order to ascend the social and professional ladder. Archaeology shows that Egyptian decorative motifs were adopted by Greeks living in Egypt from early on, but these tended to be grafted on to identifiable Greek structures. The current excavations in the harbour of Alexandria may well extend our knowledge in this area.

Ptolemaic Egypt grew into arguably the most powerful of the Hellenistic empires in the 3rd century BC. At that period it was characterized by good kings and relatively stable government, and the development of the most powerful ancient navy of all time under Ptolemy II Philadelphus (ruled 285–246 BC) meant that Ptolemaic Egypt became a major player on the Mediterranean stage. Its navy took on the protection of the Greek islands against the scourge of pirates in the Aegean (attested through honorary inscriptions at Delos and elsewhere). Egypt also established hegemony over Cyrenaica (which had been colonized by the Greeks since the 7th century BC) and Cyprus, and developed a flourishing commercial relationship with the independent Greek island of Rhodes. Military outposts were established in several places, and Egypt was always an active observer of, if not always an active participator in, political events in Greece and Asia Minor. There is evidence of some involvement against the Macedonian Antigonid kingdom in mainland Greece, and several wars were fought in the 3rd and 2nd centuries BC against the Seleucid empire of Syria over the area known as Koile ("Hollow") Syria, roughly the area we consider as the Levant, or Middle East.

Greek relations with Upper Egypt (the area known as Nubia) were not always happy, and native revolts and even temporary secession are attested at the end of the 3rd century BC. Perhaps as a means towards internal cohesion, the Greek kings allowed, or possibly ordered, themselves to be depicted in Egyptian garb in statues and temple reliefs for native consumption, many examples of which exist today. Several took pains to foster the ancient native religion of Egypt and generously endowed various non-Greek cults and temples, such as those of the Apis bulls at Saqqara, near the old dynastic capital Memphis. During the Ptolemaic period, huge temples very much in native style were built at Kom Ombo (Ombos in Greek), Edfu (Apollinopolis Magna), and Dendera (Tentyra), and Ptolemy V had a coronation ceremony in which he was crowned pharaoh, a fact to which the famous Rosetta Stone refers. Ptolemy I is usually credited with the creation of the hybrid cult of the Graeco-Egyptian god Sarapis, perhaps intended to appeal to both nationalities, who was worshipped at important shrines at Memphis and Alexandria. Still, it appears that the Greek kings remained very much Greek in their upbringing, outlook, and personal behaviour, and the ancient evidence attests that the last Ptolemaic ruler, Cleopatra VII, was the first monarch to speak native Egyptian. From the time of Ptolemy II, the kings with a few exceptions (i.e. marriages to politically useful Greek princesses from other Hellenistic empires) practised brother–sister marriage, and this remained the norm until the end of the dynasty. As a result, the family line remained Greek, despite occasional evidence of adulterous liaisons.

In common with the other Greek empires of the east, the Ptolemaic dynasty could not ignore the growing might of Rome, which from the 2nd century BC onwards gradually

incorporated the Hellenistic kingdoms into its own territory. Roman power was invoked on one or other side of disputing Ptolemies, and by the beginning of the 1st century BC the Greek throne of Egypt was secure only through the intervention of Rome. After her famous liaisons with Julius Caesar and Mark Antony, and the defeat of her forces and Antony's by Octavian (later to be Augustus, the first emperor of Rome), Cleopatra committed suicide in 30 BC and the Ptolemaic dynasty ended. Her sons by both Romans were soon killed. Egypt passed into the possession of Rome and soon became the personal property of the Roman emperor of the day, governed for him by an equestrian prefect.

The Greek population of Egypt, however, remained and carried on with their lives much as they had always done, with the exception that there was now a foreign overlord. But Greek language and administrative procedures were retained for another 300 years. The flourishing economy created by the Ptolemies over centuries meant that Egypt's prosperity was a jewel in Rome's crown, and the huge grain ships which sailed from Egypt every year were a vital source of food for the Roman people. Alexandria grew into one of the largest cities of the Roman empire, and continued the tradition of Greek scholarship (both pagan and Christian) championed by it since the 3rd century BC. At the end of the 3rd century AD Egypt passed into the control of the Greek Byzantine empire based in Constantinople, but it was too far away from the political centre for much effective involvement on the part of the imperial government. In AD 642 Egypt was conquered by the Arabs who were gradually eroding the fringes of the Byzantine empire, but still Greeks continued to live there under yet another foreign ruler. There were large communities of Greeks in Cairo and Alexandria well into the 20th century, who contributed greatly to the commercial success of Egypt, and who, in common with other resident foreign enclaves, created the cosmopolitan and exotic mixture of peoples and atmosphere which characterized these cities. During World War II and against the backdrop of severe political turmoil in Greece, king George II of the Hellenes and the Greek royal family were forced to flee Greece, and established their court in Cairo for five years (1941–46).

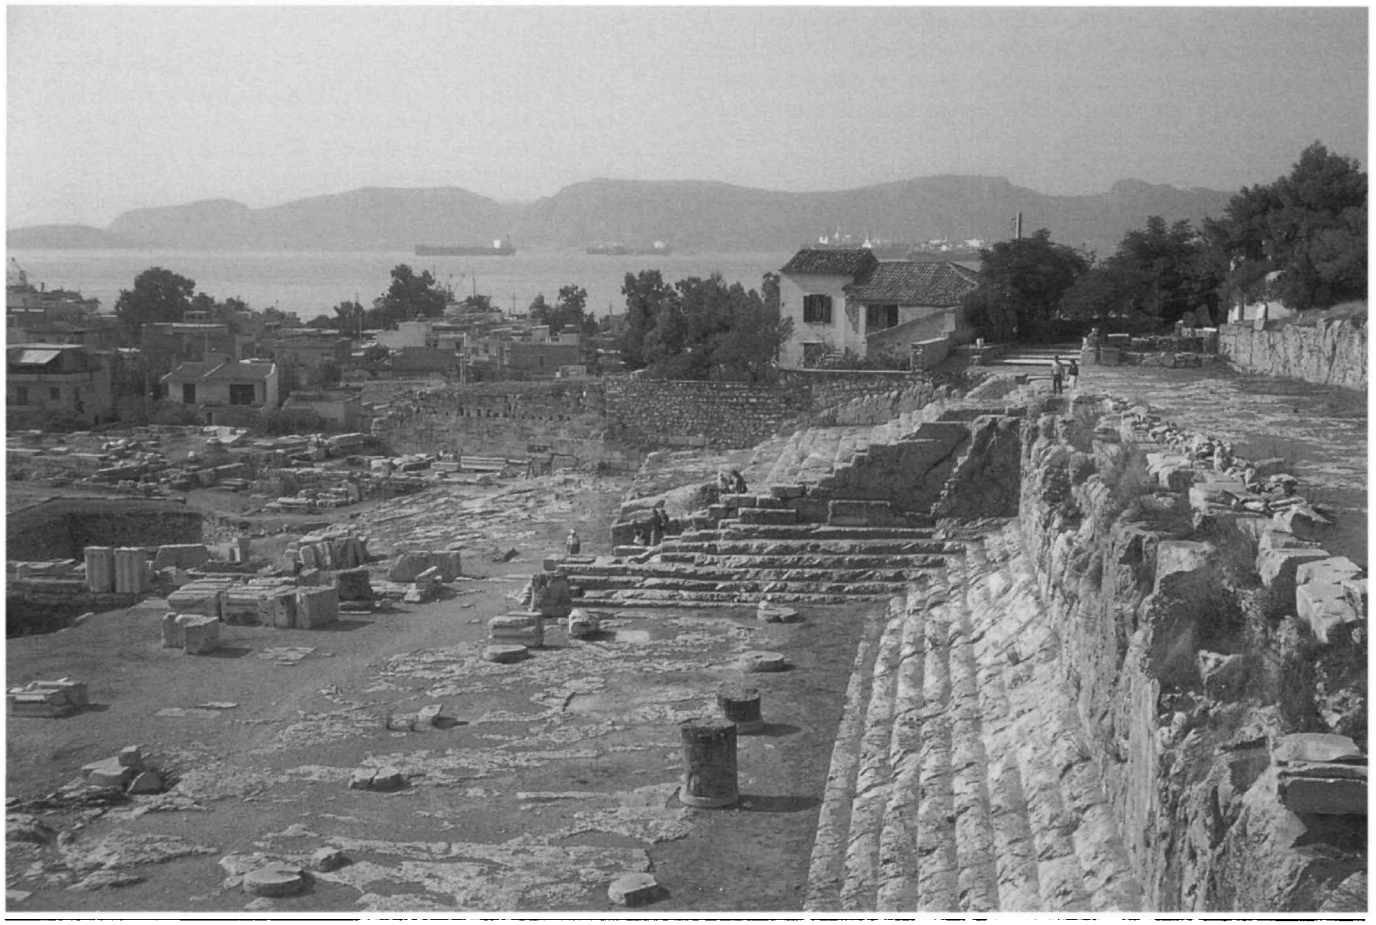
Eleusis

City in Attica

The most important town in ancient Attica after Athens and the Piraeus, Eleusis is located 24 km northwest of Athens on a landlocked bay and at the head of the fertile Thriasian plain, in antiquity the region's main wheat and barley grain producer. In Greek mythology the Thriasian plain was the first to be sown with seed and to yield crops. Eleusis was strategically placed, as it lay opposite the island of Salamis and at the junction of the trade routes from Attica, central Greece, and the Peloponnese. Eleusis, Panacton, and Phyle served as border forts for the western defence of Attica.

The site dates back to at least the Early Bronze Age. Current excavations have revealed on the west slope of the acropolis a small deposit of Early Bronze Age remains, Middle Bronze Age



Eleusis: looking south over the Telesterion or Hall of Mysteries, the large square building in the foreground, with the island of Salamis in the distance

house walls, and Late Bronze Age walls; in the 15th century BC a porched hall (megaron) was built on the site of the Hall of Mysteries, the main cult site of the ancient city. The relationship between Athens and Eleusis during the prehistoric period is not clear, although Athenian legends speak of wars between Athens and Eleusis during the Late Bronze Age, until Theseus unified Eleusis and 11 other Attic towns under the hegemony of Athens. All that can be said with certainty is that, on the basis of archaeological and historical evidence, Eleusis was subject to Athens at least as early as the 8th century BC. In subsequent centuries Eleusis grew ever greater in size and importance, thanks to its Panhellenic Mysteries of Demeter and Persephone. Eleusis was devastated in 480/79 BC by the Persians (whose breach of the walls is still evident), but was almost immediately rebuilt by the Athenians. The city enjoyed prosperity throughout the Classical and Hellenistic periods. Later on, Roman aristocrats and emperors like Hadrian built up the sanctuary. After the Sarmatian Costobocs invaded and sacked the city in AD 170, the emperor Marcus Aurelius restored the site upon his initiation (in 176 he had become the only lay person to enter the "Holy of Holies" in the sacred Hall of Mysteries). Eleusis suffered irreparable damage at the end of the 4th century: in 391 Theodosius I proscribed all pagan cults, including the Eleusinian Mysteries, and then four years later the Visigothic army of Alaric destroyed the site. Eleusis was the victim of further attacks, but this time at the hands of Christians, and was deserted in the Byzantine era, remaining so until the 18th century. Modern Eleusis is an industrial city of cement, chemical, and steel factories. The bay is home to shipbuilding, oil tankers, ship repair docks, and a naval training academy. Pollution is heavy, the traffic unbearable, and many refineries and factories are in need of modernization.

Eleusis's fame rested on the Mysteries of Demeter and Persephone, the most renowned and important of Greek mystery cults. According to the ancients, the rites were established in the 15th century BC; however, there is no firm archaeological evidence for Late Bronze Age cult activity. It is clear, though, that the rites were known throughout Greece by the time of the *Homeric Hymn to Demeter* (650–550 BC), according to which the mysteries were established to celebrate the return of Persephone to her mother Demeter, the goddess of grain. According to the legend, Persephone was raped by Hades and carried off to his underworld realm. In her grief Demeter wandered the earth, searching for her daughter. She came to rest at Eleusis, where she befriended the king and promised to teach the Eleusinians her rites and mysteries. Demeter refused to allow crops to grow until Persephone was released, and so humankind was brought to the brink of starvation and sacrifices to the gods were in danger of ceasing. Hades yielded to the entreaties of Zeus and released Persephone who, however, since she had eaten food (a pome-

granate seed) in the underworld, could not be fully restored to the upper world. Thus, although Persephone could spend eight months a year with her mother, she was compelled to spend the rest of the year in the underworld. This arrangement explains the growing cycle: during the reunion of mother and daughter, crops grow and lush vegetation spreads throughout the world, but on Persephone's return to Hades, the growing season comes to an end.

The *Homeric Hymn to Demeter* states that, after Persephone was first returned to her mother, Demeter revealed her mysteries to the leading citizens of Eleusis. Many of the sacred rites that form the essence of the Eleusinian Mysteries are not known, as disclosure of the rites was punishable by death; for a millennium and more that secrecy was preserved. (The great tragic poet Aeschylus, a native of Eleusis, was nearly lynched by an angry mob because the audience at one of his plays thought he had revealed some of the rites, while the famous Athenian general Alcibiades was condemned to death, in absentia, for conducting a parody of the mysteries.) What transpired in the mysteries may be reconstructed as follows. The cult was run by the city of Athens, although two families from Eleusis, the Eumolpidae and Ceryces, controlled the priesthood. Candidates for initiation (*mystai*) came to Athens in the early spring for the ritual called the Lesser Mysteries, the purpose of which was to prepare the candidates for initiation into the Greater Mysteries. Anyone who could speak Greek and was free of blood-guilt was eligible; the inclusion, in a Greek cult, of women, slaves, and Greek-speaking foreigners was remarkable. The *mystai* returned to Athens for the Greater Mysteries, a nine-day festival in the month of Boedromion (September/October). After six days of purification, washing, fasting, and sacrifices, a procession of priests and *mystai* left Athens for Eleusis via the Sacred Way. Stopping frequently for sacrifices, dancing, and singing, the procession arrived at night at the sanctuary. (A 35-m stretch of the Sacred Way has been unearthed near the 2nd-century AD bridge over the Cephisus river outside the city.) That night in the Hall of Mysteries the *mystai*, about 2000–3000 strong, were initiated into the mysteries and became *epoptai* ("those who have seen"). The ritual probably included a sacred meal, the revealing of the sacred objects of the cult, a re-enactment of the story of Demeter and Persephone, and dancing and sacrifices. Ancient sources relate that the *epoptai* were guaranteed a better life on earth and the promise of an afterlife. *Epoptai* could participate in the ritual as many times as they wished, and many did because of the intensely emotional spiritual experience. The personal communion with a deity, the promise of immortality, and the intensity of a shared bond with other worshippers made the mysteries a sharp contrast to state cults. The mysteries fulfilled spiritual yearnings in ways that mythology, legends, and official cults could not.

The archaeological remains at Eleusis are connected for the most part with the mysteries. The entire site is enclosed by magnificent fortifications from the Archaic to late Classical periods; the west wall, with its round and square towers, is perhaps the finest example of 4th-century BC fortification. The sacred precinct, lying on the south slope of the acropolis, was entered through two propylaeas: the Greater Propylaea, built by Marcus Aurelius in imitation of the Propylaea on the Athenian Acropolis, and the Lesser Propylaea, erected in the mid-1st century BC by the Roman aristocrat Appius Claudius Pulcher and his two nephews. Just inside the sanctuary, to the immediate right, is a cave with a small 4th-century BC temple dedicated to Hades; the cave was believed to be the entrance to the underworld. Just to the west is the Temple of Demeter or the Hall of Mysteries (Telesterion). A megaron from the Mycenaean age was built here, but it may not have had any cultic significance. The Telesterion had ten different building phases. In its final phase the hall was 56 m ¥ 66 m, with eight tiers of seats on each side. Forty-two columns supported the wooden roof. In the centre was the *anaktoron* ("Holy of Holies"), which contained the cult's sacred objects, and the high priest's chair. Except for the doors on three sides, the walls were solid, creating a dark, mysterious atmosphere. To the west of the Telesterion are remains of the council house, a 7th-century BC hero shrine, a Roman cult building dedicated to the sun god Mithras, and a gymnasium. On the acropolis are remains from the Bronze Age and the Hellenistic period. Immense Roman bath complexes have been found around the sacred precinct and in the modern town. To the south of the ancient site are a stadium and theatre; these should be understood in connection with the Eleusinia, which were games held every fourth year (that is the third year of the four-year cycle of the Olympiad) and to a lesser extent two years later. For Athenians, the Eleusinia ranked behind only the Panathenaic games in prestige.

Eleusis may have lost its importance after its destruction in the 5th century AD, but the mysteries and the *Homeric Hymn to Demeter* continued to exert influence. The rape of Persephone proved popular in literature, and the legend and the Mysteries have attracted scholars in such fields as psychoanalysis, religion, feminism, gender studies, folklore, comparative mythology, and sociology. Moreover, the mysteries, with their promise of an afterlife and intense intense emotional transformative experience, tapped into the spiritual cravings of the ancient Greeks and Romans, and so paved the way for religions like Christianity and Mithraism.

Summary

City in Attica, 24 km northwest of Athens, Eleusis was strategically sited at the junction of trade routes from the Peloponnese, central Greece, and Attica. There are remains from the Early Bronze Age but no evidence of cult activity from that time. Eleusis is famous for the mystery cult of Demeter and Persephone which was well known by the Archaic period and attracted initiates from all over Greece. The cult was proscribed by Theodosius I in AD 391.

Elytis, Odysseus 1911–1996

Poet

Odysseus Elytis was born in Crete of parents from Lesbos. He published his first poems in 1935 and established himself as one of the leading figures in the "1930s Generation", which also included Greece's other Nobel laureate, George Seferis. He travelled widely and, after World War II, lived in France for long periods, associating with leading poets and artists of his generation. He published 17 collections of poetry, a number of translations from ancient Greek and modern European poets, and two large volumes of prose writings. He was also an accomplished artist. In 1979 he was awarded the Nobel Prize for Literature.

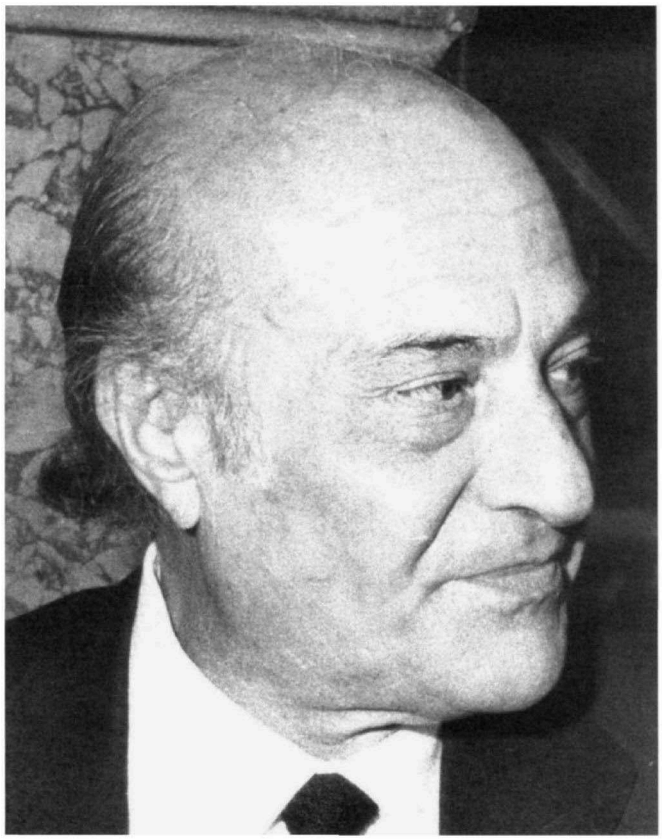
Elytis began his poetic career clearly influenced by French Surrealism, and by Éluard in particular. Less emphasized by critics is the influence in his later works of the German Romantics, notably Hölderlin. However, he was always keen to emphasize his link with what he considered to be the genuine Greek tradition, in which he included poets such as Homer, Pindar, Sappho, the ancient lyric poets, Romanus the Melodist, Dionysios Solomos, and Andreas Kalvos.

It is indicative that he translated Sappho and Crinagoras (both poets from his native isle of Lesbos), and referred to Sappho as "a distant cousin", in the sense that they both worked with the same concepts and words. Similarly, he wrote extensive studies of Romanos and Kalvos, and often expressed his adulation for Solomos, whom he referred to as "one of the greatest lyric poets throughout the world and throughout the ages". And elsewhere, he spoke of his debt to Solomos, the poet who, together with Hölderlin, followed Elytis "with a watchful eye". Less obvious, though equally genuine debts are due to the ancient philosophers Heraclitus, Plato, and Plotinus. Elytis referred to them regularly in both his poetic and his prose works. Many of Elytis's poetic utterances, particularly in his later works, could be almost "presocratic" in their obscurity and polysemy, and the assertion by Georgousopoulos that "Elytis descends directly from the presocratic logos" is certainly justifiable.

In his address to the Swedish Academy on receiving the Nobel Prize in 1979, Elytis set out his views on the Greek poetic tradition. He stressed that he wrote in a language that is spoken by only a few million people, yet one that has been spoken for two and a half thousand years without interruption and with a minimum of changes. He went on to point out the difficulties that a poet faces when he uses for the things most dear to him the same words used, for example, by Sappho or Pindar – without, however, his having the same impact that they had throughout the then civilized world. It must not be forgotten, he said, that over a span of 25 centuries there was not one century when poetry was not written in Greek and that every Greek poet has to face the great weight of tradition borne by the Greek language.

Elytis maintained that the sphere formed by modern Greek poetry has, like every sphere, two poles. At one end he placed Solomos, who, he believed, from the point of view of expressiveness, succeeded – before the appearance of Mallarmé in European letters – in formulating with complete consistency and rigour the idea of a *poésie pure* with all its consequences: subjugating sentiment to intellect, refining expression, and making full use of the instrument of language in moving towards the miracle. At the other pole he placed Constantine Cavafy, who, like T.S. Eliot, had arrived at extreme economy of expression, at the greatest possible precision, eliminating all form of turgidity in the expression of his personal experiences. Between these two poles, some nearer to one, some nearer to the other, he placed other major Greek poets: Andreas Kalvos, Kostis Palamas, Angelos Sikelianos, Nikos Kazantzakis, and George Seferis. This schematic representation of Greek poetry is important as it provides an insight into how Elytis saw the Greek poetic tradition and his place in it.

He elaborated on this even further in his essay entitled *Romanos O Melodos* (Romanus the Melodist), in which he distinguished and contrasted two types of poetry which he termed "prismatic" and "plane". The terms are novel, as is the classification of Greek poetry that is put forward. What is of concern is not the question of the objective validity of this distinction, but its importance for understanding Elytis's poetics. The features of these two types of poetry may be summarized as follows. In prismatic poetry, words are never on the same plane but *undulate*. The poetic text is organized around certain "nuclei" which stand out like peaks within the poem and which, in retrospect, can be seen to hold the poem together. These "nuclei" are not necessarily images, but are rather phrasal units with a self-generating radiance, in which the combination of the word's image and sound coincides with the cognitive meaning to such a degree that it is impossible to decide whether the poetic effect comes from *what* the poet says or the *way* he says it. The repetition of this feature gives a prismatic form to the poetic expression. Poems containing this feature affect the reader not only as a whole, but also in their parts, precisely because of these peaks, these concentrated and laconic crystallizations of the poetic spirit. They are utterances, Elytis maintained, in which the cast of the language and the images produced are fused and in which the formulation of a truth gives rise to another perception of the world as apprehended through the imagination. The test of this type of poetry is to imagine that 90 per cent of the poetic text has been lost and to examine whether the fragments that remain still function as poetry. Here, he cited the case of Sappho. Prismatic poetry, according to Elytis, is that feature which characterizes



Odysseus Elytis, poet and Nobel laureate

the true Greek poetic tradition, and is a feature of Homer, Pindar, Sappho, and the ancient lyric poets, Romanos, Kalvos, and, by inference, Elytis himself.

Plane poetry, on the other hand, is characterized by a flat, linear form of expression. It is narrative in style and has a poetic value not in its parts but only when taken as a whole. If such poetry is fragmented, all that remains is "plain statements". As exponents of this kind of poetry, he mentions Seferis and Cavafy. He attributed the appearance of this kind of poetry in the Greek (prismatic) tradition to the excesses of the other kind and to the influence of foreign, particularly Anglo-Saxon, poetry. Elytis did not reject this poetry but considered it as being outside the true Greek tradition. Without explicitly saying so, Elytis makes it clear that he favoured the tradition of prismatic poetry, his description of which corresponds entirely to the features of his own poetry. As one critic rightly remarked: "In this contrast [between prismatic and plane poetry], we find the clearest expression of his own poetics."

His views concerning a particular poetic mode of expression are, of course, linked with his views as to the deeper function of poetry. Poetry, for Elytis, was not a pastime but a mission. It "rises up at the point where rationalism lays down its arms for poetry to take them up and advance into the forbidden zone". And it is perhaps not without significance that here too he took issue with the Western conception of poetry, just as he did with Anglo-Saxon poetry in terms of poetic expression. He understood poetry as having come about "to correct God's mistakes; or, if not, then to show how mistakenly we perceive His gift" and he asserted that the pile of materials that constitute this world could, with a different method of assembly, dictated by our sentiments, produce a more inhabitable dwelling. Yet, in trying through poetry to reassemble the elements of the world, to make a Heaven out of a Hell, "we came up", he says, "against an unbreachable wall: the Western perception of art, that because of its inability to move on a mythical level, has come to confine itself to observation and analysis, transferring the area of a poem from a nucleus of mysterious radiances to a simple melancholic confessional".

It can be seen from the above that Elytis set himself firmly within the Greek poetic tradition (as he defined it) and outside the 20th-century Anglo-Saxon tradition, which may partly explain the relative lack of acceptance of his work in the English-speaking world, at least in comparison with Cavafy and Seferis.

Emigration

Emigration is the act of moving from one country or region to another as a place of abode. The very making of Greece was the result of emigration of Greek-speaking tribes from the north into the Greek peninsula during the Bronze Age. In the centuries between the penetration and diffusion of the Greek-speaking tribes into the Greek peninsula and its conquest by the Romans, emigration was practised as an answer to various

kinds of problems: war, famine, demographic pressure, poor standard of living. Emigration, constantly present in ancient Greek society, is a complex phenomenon addressing in different sociohistorical circumstances different needs. This article covers the great migratory movements of ancient Greek history through to the emigrations of Greeks in medieval and modern times.

The first extensive emigration took place between 1125 and 800 BC. There occurred three types of emigration during this period: (*a*) of Greeks who had previously settled in mountainous parts of the mainland and whose development lagged considerably in comparison to the tribes who participated in the Mycenaean civilization; once the decline of the Mycenaeans set in, these mountainous Greek tribes moved to the sites of the Mycenaean acme; (*b*) of refugees created by the first type of migratory movement; and (*c*) of early colonization of the east Aegean.

During the Archaic and Classical periods emigration was almost exclusively conducted by poor citizens of the city states. The majority of peasants owned small plots of land which were often insufficient for their sustenance. The situation was aggravated by inheritence rules, which prescribed the equal distribution of land among all male heirs, and which led to considerable land fragmentation. In addition, within the city states mechanisms of wealth transfer from the peasants to the city were also at play. In such a situation poor citizens often emigrated in search of a better life.

The character of emigration was profoundly changed in the time of Macedonian splendour. The annexation of territory in Egypt and Asia Minor by Alexander the Great gave rise to extensive emigration to these new lands. All through the 4th century BC large numbers of emigrants were drawn to the east in the hope of a career in the administration or the army, or even in the hope of acquiring land. As it was required of administrators and various officials to master the Greek language, the annexed territories offered great opportunities for career advancement to those Greeks who emigrated there.

In Byzantine times wars and the search for resources were the major causes of emigration. Invasions by enemy troops created a climate of instability in the countryside leading whole families to emigrate to areas or cities considered safe. Towards the end of the 6th century AD, when the northern borders of the empire collapsed, there was an emigration wave westwards to the Ionian islands and Italy. Although emigration was usually practised by the most needy members of the population, the economic pressures exercised on peasant households forced even wealthy peasants to emigrate. A different kind of emigration emerged just before the fall of the Byzantine empire. After the defeat of the crusaders at Nicopolis in 1396 many intellectuals fled west to Italy and north to the states of the Dunav. Here Greek emigrants formed sizeable communities which later played an important role in the formation and development of the Greek nation.

Emigration was not halted by the Ottoman conquest of the Byzantine empire. On the contrary, the hardship of Ottoman rule often forced Christians to emigrate. Thus, by the 17th and 18th centuries Greeks had formed dispersed communities in the Mediterranean countries – especially Romania, Russia, and Egypt. The Greeks who emigrated during this period were predominantly peasants who moved from small villages to urban centres of central Europe and Egypt, and from agriculture to trade and services. The transition from peasant status to city-based occupations was viewed as a step up the social ladder. This upward social mobility was desirable not only to the emigrant as an individual, but also to his family in Greece, as the family of origin gained both materially and in prestige by the emigrant's new elevated status. In this sense, emigration during the 17th and 18th centuries was largely part of a family policy which aimed at individual and family upward social mobility.

The wave of Greek emigration to the cities of central Europe was halted by the weakening of the Ottoman empire and the Greek War of Independence in the 19th century. Equally important was the rise of nationalism in the young Balkan states and the formation of a local middle and enterpreneurial class; as a result, outsiders, such as Greek emigrants, were excluded from these positions in the social and economic hierarchy.

Shortly after the establishment of the Greek nation state in 1830 there was a new emigration wave. The economy of Greece was largely based on agriculture, the structural problems of which were clearly felt very soon after the establishment of the state. The typical small-scale independent agricultural holding which resulted from the distribution of lands formerly belonging to Turks proved devoid of potential for further development and unable to sustain the growing village population. The beginning of the 20th century saw a demographic boom in the Greek countryside. At the same time, inheritance rules precluded the accumulation of land; on the contrary, they led to its further fragmentation, thus posing serious obstacles to the development of the rural economy. This provided the basis for the ensuing manpower surplus in Greek villages and the underemployment of Greek peasants. Under these conditions emigration emerged as a means not for social mobility, but for securing employment.

The rapid development of capitalism in the USA in the early 20th century, and the need created there for working hands to support the industrialization of the country, attracted the first big emigration wave from the young Greek nation state: from 1900 to 1920 over 400,000 Greeks emigrated, most to the USA and Australia. The numbers of Greek emigrants directed to other countries of reception, such as Brazil or Canada, were insignificant. Most of these emigrants were men of working age, between 19 and 45 years of age.

Once the link with the USA was established, Greek emigrants formed networks of reception for newcomers from Greece. This allowed new emigrants to organize better their transition to the country of reception. Furthermore, the existence of these networks of relations and the accumulated knowledge of the society and its market enabled Greeks in the USA to move from manual work to the sector of services and trade.

The emigration wave towards the USA was seriously halted after 1922 for a number of reasons. In the USA the Act on "quotas", which was passed in 1922, posed limitations on the number of emigrants accepted from each country of origin. It was, therefore, only possible for a certain number of Greeks to emigrate to the USA. At the same time, the situation created in Greece by the annexation of new territories, the process of urbanization, and the attraction exercised by the new urban

centres within the country created hopes in Greeks that they could attain a better standard of living within their own country.

The promise of development, however, was not carried out and, in the aftermath of the two successive wars – World War II and the subsequent Greek Civil War – Greece was faced with extensive poverty. The problems of Greece as a dependent country on the periphery of Europe became more pronounced after the wars as investment in the productive sectors of the economy was minimal. In the cities unemployment grew, while the rural sector remained stagnant. Agricultural holdings were to a great extent maintained through money transfers from abroad. The problems associated with land fragmentation and the low mechanization of agriculture continued and were aggravated by state policies which often proved a hindrance to agricultural development. Low productivity and the underemployment of peasants resulted in stagnation in rural Greece and, in turn, drove large numbers of peasants to migration, internal and abroad. Added to the above was the climate of insecurity in postwar Greece, characterized by political instability and the persecution of left-wing citizens, which, again, drove people out of the villages and to the cities of Greece and Europe. The late 1950s and 1960s were decades of modernization, rural exodus, and rapid urbanization for Greece. City life became an ideal, while villages presented an image of abandonment; emigration under these conditions provided the opportunity for a desirable life-style and the acquisition of goods not available in the villages.

Under these conditions there was a resurgence of emigration in the postwar period. This new emigration wave was most pronounced between 1955 and 1975. What differentiated this new emigration wave from that at the beginning of the 20th century was that, along with the USA, Australia, and other overseas destinations, the countries of northern Europe emerged as major recipients of Greek emigrants. After World War II the countries of northern Europe entered a phase of rapid industrial development and were therefore in need of working hands. The surplus manpower in Greece and other countries of southern Europe supplied the labour which made possible the development of northern Europe.

The first European recipient of Greek emigrants in the 1950s was Belgium, where emigrant workers were employed in the coal mines. It was West Germany, however, which later developed into the major recipient of Greek emigrants. The years subsequent to World War II saw the rapid development of West Germany, often referred to as a miracle. In order for this "miracle" to take place, emigrant workers, known as *Gastarbeiter*, were employed in German industries as unskilled labourers in positions largely considered inferior by the German citizen.

Emigration towards West Germany shared most of the characteristics of the earlier emigration wave to the USA. Emigrants were again recruited from the productive age groups – between 19 and 45 years of age – as well as from the healthier and more energetic among the population. Indicative of the situation of emigrants is that only 4.3 per cent of the Greek emigrants in West Germany in 1971 lacked formal education while the relevant percentage of those remaining in Greece was 12 per cent. Once the first emigrants settled in Germany they acted as attraction poles for their friends and relatives in Greece. In this way whole communities of emigrants from the same town or village of origin were formed in Germany. The geographical proximity of West Germany to Greece allowed for more frequent visits of emigrants to their home country, helping the maintainance of close ties with the country of origin.

The influx of Greek emigrants in West Germany followed the fluctuations of its economy, emigrant numbers falling in times of economic depression and rising again in times of prosperity. In 1973, however, the German emigration recruitment office in Greece was closed, causing a serious cutback on Greek emigration. The waning of emigration to Germany signalled the end of mass emigration movements from Greece and attention shifted to the problems associated with repatriation.

Empedocles *c.*492–432 BC

Philosopher

A native of Acragas (modern Agrigento) in Sicily, Empedocles was a leading philosopher of his time. He is difficult to classify

because of the complexity of influences he manifests. He is at once a philosopher and a medicine man: while he constructs a rational cosmology, he also claims to have magical powers to raise the dead and change the weather. In his thought he both preserves Pythagorean religious teachings from the western Greeks and continues the scientific research of the eastern Greeks in Ionia. He accepts Parmenides' denial of coming to be, yet propounds a philosophy of natural change. Though a philosopher, he writes epic verse in a florid style; appealing to the authority of reason and argument, he also presents his theory as a revelation from the deities of Greek religion.

The most immediate philosophical influence on Empedocles is Parmenides. Empedocles adopts from him both the device of using epic conventions and diction to express his views, and some of his views as well, echoing Parmenides' own language. Most importantly, he accepts the principle that nothing can come to be from what is not. Furthermore, he agrees with Parmenides that the senses are suspect, though he ultimately accepts the testimony of the senses if they are used properly. But Parmenides seems to go on to use his principle that nothing comes from what is not to argue that there is no change at all, and that what our sense experience presents us with is no more than illusion. Empedocles, to the contrary, offers a positive account of how change is possible.

While there is no coming to be or perishing, strictly speaking, there are elements that can combine and separate to present the appearance of things coming into being and changing. The many substances of the world are on this theory mixtures of elements. Empedocles uses the simile of artists painting with a set of colours. By combining a few colours and drawing appropriate shapes with them, the painter may represent the infinite variety of things in the world. So nature produces the world with a few elements. Empedocles presents four elements, which he call "roots" (*rizomata*): earth, water, air, and fire, as combining in whole-number ratios to form compounds. For instance, bone consists of two parts earth, two parts water, four parts fire. The elements are acted upon by two forces, which he personifies as Love and Strife, or, roughly, attraction and repulsion.

The elements and forces take part in an elaborate cosmogony. At one time, in the present cosmos, the elements were separated out into concentric layers of earth, water, air, and fire, while Strife played an important role. But gradually Love comes to dominate in the world, combining the elements more and more until at last all the materials of the world are completely harmonized into a homogeneous sphere (*sphairos*) pervaded by Love. In the sphere there are no differences manifest, and hence no living things, no world as we know it. But at some point Strife attacks the sphere from the periphery and causes the elements to separate from one another, whereupon the cosmos begins to form. This alternation between the sphere and the cosmos forms a never-ending cycle of cosmic change.

Empedocles' theory of soul is deeply influenced by Pythagorean thought. The soul falls into a body as a result of the influence of Strife. It undergoes a cycle of reincarnations in plants, animals, and humans until it is purged and purified. The evils of mortality are compounded by the shedding of blood; Empedocles compares the eating of meat to cannibalistic consumption of one's relatives. Souls may progress to higher forms of plant and animal life and eventually to human life and its highest manifestations, from which they return to the status of gods. Empedocles announces that he "goes about as a mortal god, no longer mortal, honoured by all" (fr. 112. 4–5). He seems to be claiming to have achieved a state of purity that precludes further reincarnations, one that confers on him the magical powers to which he pretends. His philosophy thus forms part of a larger religious vision. Empedocles recognizes traditional gods, but calls them "long-lived" rather than "immortal", suggesting that they are beings subordinate to the cosmic cycle who will eventually be absorbed into the sphere. In his anthropology he looks back with longing to a primitive golden age in which humans and animals lived in harmony under the rule of Love, and worship was carried on without animal sacrifices.

Empedocles' views on nature, including specific discussions of biology, influenced Greek medical writers from the 5th century BC onwards, some of whom criticized him, but in doing so recognized his influence on medical studies. His great contribution to the scientific tradition was the theory of a finite set of elements forming an unlimited number of compounds by their combinations in whole-number ratios – a theory that has become the basis of modern chemistry. His specific set of four elements became standard by the following century and remained the basic substances of physical theory in both the Greek world and the west until the beginning of the modern era. Empedocles' religious ideas became part of the Neopythagorean and Neoplatonic traditions of later centuries.

DANIEL W. GRAHAM

Biography

Born *c.*492 BC at Acragas in Sicily, Empedocles came from an aristocratic family which had taken part in the Olympic Games. He himself seems to have been a doctor and to have been active in politics as well as in religious and philosophical circles. He was clearly influenced by Pythagoreanism as well as by the thought of Parmenides. He wrote two poems, one physical (*On Nature*), the other religious (*Purifications*), of which only fragments survive. He died in 432 BC.

Enamel

Enamel is essentially coloured glass. When heated to its melting point, glass fuses with the metal with which it is in contact, and craftsmen have long exploited this property by decorating metal with boldly coloured opaque or jewel-like translucent enamel. It may well have been a Mycenaean invention: the earliest occurrence is thought to be on gold-relief beads from chamber tombs at Mycenae of *c.*1400 BC (Athens, National Archaeological Museum, Mycenae graves 88, 103). Blue enamel was fused into depressions in the repoussé-work, sometimes ringed by tiny spheres of gold.

The earliest cloisonné enamel to have survived is probably that on finger rings found in a tomb of the 12th century BC in Cyprus (Nicosia, Cyprus Museum, Kouklia Evreti grave 8/33). The design was created, and the different colours of glass separated, with strips of gold set on edge in glass disks, which were then mounted on the bezels of the rings. The fully developed cloisonné technique, in which the metal strips are attached to a metal backplate, is found on the bezel of a ring from a Minoan tomb of *c.*1425–1400 BC near Knossos (Herakleion, Archaeological Museum, Sellopoulo grave 3, J 6) and on the famous Kourion sceptre (Nicosia, Cyprus Museum, J 99); however, the vitreous material on the ring may not be enamel, and the sceptre may belong to a later culture.

There is little further evidence for the use of enamel in the Greek world before the 6th century BC, when filigree enamel – glass fused to the surface of an object inside loops of decorative wire – seems to have come into fashion, with blue and green the most common colours; it remained popular during the Classical and Hellenistic periods. Between the 3rd and the 1st centuries BC small pendants to be attached to jewellery were enamelled in the round, probably by being heated and dipped in molten glass, which was almost always white.

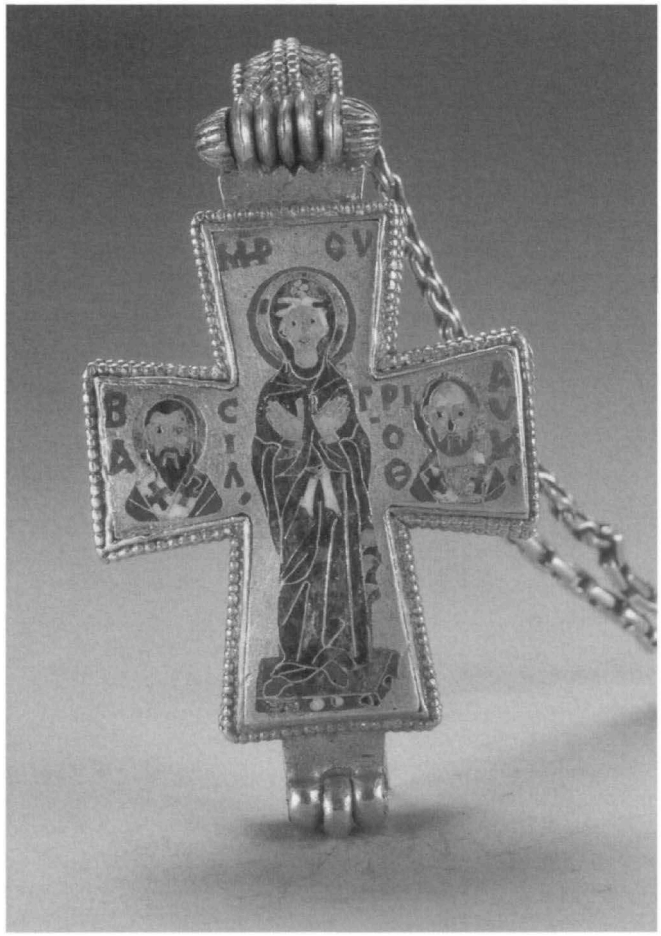
Late-antique and early-Byzantine goldsmiths may well have carried on the tradition of filigree enamel, but evidence is lacking: a medallion (Paris, Bibliothèque Nationale, Cabinet des Médailles, M 1688) with a bust of Licinia Eudoxia, daughter of the eastern Roman emperor Theodosius II (408–50) and wife of the western emperor Valentinian III (425–55), was almost certainly made by the goldsmith responsible for another filigree enamel medallion, depicting a cross and two orbs (Baltimore, Walters Art Gallery, 44. 304), which has been shown to be of recent manufacture (post-17th, and probably late-19th century).

The only incontrovertibly late-antique or early-Byzantine enamel is on jewellery characterized by isolated motifs, typically birds, standing proud of the surfaces of the objects. A pendent cross (Washington, D.C., Dumbarton Oaks Collection, 58. 40) comes from a hoard of the late-6th century AD said to have been found in Syria; another example is part of a Byzantine necklace (Mainz, Römisch-Germanisches Zentralmuseum, O 37809) with components stylistically datable to around 600. The whole group is therefore likely to date from the late 6th or early 7th century. The enamel on this jewellery is contained within a gold strip hard-soldered edge-on to the surface of the object. There is no enamel outside the main outline, where details are executed in round-section wire; both these features belong to the tradition of filigree rather than cloisonné enamel.

The technique of cloisonné enamel was reintroduced from western Europe at the end of the iconoclast period in 843 (the Poitiers triptych, once believed to have been commissioned by the Byzantine emperor Justin II (565–78), is now dated to the 11th or 12th century). In the 9th and the first half of the 10th centuries Byzantine goldsmiths produced western-style cloisonné enamel, with the figures and busts of saints, as well as other motifs, in backgrounds of translucent enamel, which was almost always green; reasonably securely dated examples are on the votive crown of an emperor Leo (Venice, San Marco, Tesoro, 116), who can almost certainly be identified with Leo VI "the Wise" (886–912). Later, from around the middle of the 10th century, the cloisonné enamel subject, instead of having a background of translucent enamel, was set into and surrounded by the metal of the plaque; this development produced what is popularly regarded as the "typical" Byzantine enamel – representations of saints silhouetted against gold, a technique that has become known as *Senkschmelz* (German: "sunk enamel"), in contradistinction to the earlier *Vollschmelz* (German: "full enamel"), where the subject or motif had a background of enamel. The earliest strictly datable *Senkschmelz* appears on a staurotheca (a reliquary for a fragment of the True Cross) commissioned by Basil the Nothos (*Proedros* from 963 to 985) and now in the Limburg an der Lahn, Domschatz. However, comparisons between the staurotheca and two chalices with inscriptions mentioning an emperor Romanos (Venice, San Marco, Tesoro, 65, 70) make it virtually certain that this emperor is Romanos II (959–63). If this is the case, the earliest evidence for *Senkschmelz* is around 960. Allowing time for development, a mid-10th-century date for the introduction of the technique seems reasonable.

Late in the 12th century there was a return to *Vollschmelz*, but, instead of translucent enamelled backgrounds, as in the 9th and the first half of the 10th centuries, the backgrounds are now opaque. Dated examples of this type of enamel are found on an enkolpion (Budapest, Magyar Nemzeti Múzeum) that belonged to Béla III (1172–96) and a cross (Copenhagen, Nationalmuseet, 9088) found in the tomb of the Danish queen Dagmar (died 1212) or that of her sister-in-law. *Senkschmelz* was not replaced by this later *Vollschmelz* but coexisted with it.

The three-dimensional face of St Michael on a famous icon of the saint depicted full length (Venice, San Marco, Tesoro, 6) is executed in relief enamel, the precursor of the *émail en ronde bosse* of the Gothic period in western Europe. The technique is also used on an equestrian icon of St Demetrius in the Guelph Treasure (Berlin, Kunstgewerbemuseum, W 3), which is probably to be dated to the middle of the 13th century.



Enamel: 10th-century Byzantine enamelled pendant cross, showing the Virgin flanked by St Basil the Great and St Gregory Thaumaturge, British Museum, London

A different sort of relief enamel, sunk instead of raised, decorates a copper funerary censer (Athens, Benaki Museum, 11469) of a type used in the 13th and 14th centuries. The technique imitates western champlevé enamel, but the metal is actually embossed copper sheet. Genuine champlevé enamel in a late-Byzantine context is found on a pair of copper candlesticks (Riggisberg, Abegg-Stiftung Bern, 8.185.72, 8.186.72). With the revival of *Vollschmelz* in the late 12th century, when an opaque enamel background obscured the metal of the substrate, the use of gold may have been considered something of a luxury; certainly there was an upsurge in the use of copper cloisonné enamel in place of gold, most examples belonging to the 13th and 14th centuries. The use of the cheaper metal, which could of course be gilded, removed one of the constraints on size, and some of the enamels on copper are considerably larger than their earlier gold counterparts.

Revived or reinvented by the Venetians in the 14th century, the technique of filigree enamel was practised in the Balkans by the 15th or 16th century, becoming the characteristic enamel of the post-Byzantine Greek world. While painted and champlevé enamel were used (for instance in the pendant and pastoral staff of bishop Parthenios of Caesarea, 1738, now in the Benaki Museum), it is filigree enamel that customarily decorates book-covers and liturgical objects. On the Greek islands earrings and pendants often took the shape of sailing ships decorated with filigree enamel. The types of ship can be used to date such jewellery to the 16th, 17th, and 18th centuries, inscriptions on some of the later examples suggesting manufacture by Greek goldsmiths working in Venice (Athens, Benaki Museum, no. 7669).

Enlightenment

The Neohellenic Enlightenment cannot be restricted to the confines of a national – let alone geographical – definition. It is the reflection of a complex interweaving of currents of renewal in the Balkans under Ottoman rule, where the Greek language took on the role of a *langue véhiculaire*, a lingua franca, but was also the language of learning, particularly in some specific cases such as, for example, in the Danubian principalities. It had an influence in the broader geopolitical area of southeastern Europe, and indeed the eastern Mediterranean basin, not to mention the strong cores of learning which appeared (as a result of the convergence of favourable trading conditions) in the Greek communities of central Europe, southern Russia (Odessa), and western Europe (Venice, Vienna, Paris, etc).

From the 18th century onwards, the crisis in the social structures and political institutions of the Ottoman empire provoked the diverse national groups which made up the social and cultural mosaic of the Balkan peninsula to seek a new social model, based on a system of values oriented towards the west. Through a series of social changes and a process of cultural osmosis, the Enlightenment was introduced into southeastern Europe by the rising urban merchant classes. Over time this led to the formulation of national demands, and culminated in the creation of nation states. Changes to the way of life were adopted gradually, and were assimilated in the face of considerable resistance. It is possible to detect them in many areas of society, both economic and intellectual, and in the transition undergone by the natural environment as the system of urban planning was being developed. The result was the emergence of new symbols and images which attempted to transcribe and to explain the innovations taking place in society.

With regard to the major western movements, modern Hellenism became receptive to the influence of the Italian Renaissance relatively late, during the 17th century. This cultural phenomenon took root not in mainland Greece but in Venetian-ruled Crete, from where it radiated out to other strongholds of Italian culture, particularly the Ionian islands. Consequently, the major part of Greece experienced the Enlightenment without having come under the influence of the Renaissance. Neohellenic culture before the Enlightenment was thus dominated by the Orthodox Christian ethic: education was based on Aristotelianism, as well as on a fixed, stereotyped choice of texts from Classical and Byzantine literature. However, from an early stage it is possible to detect the coexistence of two decisive elements: tradition and renewal. It has been said that in Greek intellectual life the development of ideas from the 16th to the 19th century is distinguished by a continuous "assimilative capacity", by a living tradition capable of receiving new elements and embracing modernity.

The first attempts to trace the development of the Neohellenic Enlightenment date from as long ago as the early 19th century, by scholars who were themselves vehicles of the movement (Adamantios Korais, Iakovos Rizos Neroulos, etc.). The Greek term for the Enlightenment, *Diaphotismos*, was coined much later, however, its appearance dating to around 1862, and probably derived from the German term *Aufklärung*. Its use is first recorded in the writings of Dimitrios Vernardakis.

The Greek *Diaphotismos* is considered to be an offshoot of the main European Enlightenment. If this neologism was created in connection with the corresponding European terms (*Lumières*, *Aufklärung*, and *Illuminismo*), the expressions of *phota* (lights), lights of Europe (*lumières de l'Europe*), enlightened nations (*nations éclairées*), which lead us to the connotations of the French term *lumières*, do not belong to the field of neologisms. The symbolic meaning of light belonged to a centuries-old linguistic arsenal, from Classical rhetorical models and humanistic learning, to the vocabulary of "religious humanism" of the 17th century (where the exhortation for the Enlightenment of the *genos* (race) led to a symbiosis of Classical learning with Byzantine tradition). In the 18th century the term was incorporated into a new frame of reference and was enriched with new, dynamic semantic connotations. The alignment with the achievements of western thought is clear; but this process presupposes a rehabilitation of values, from antiquity through the western Renaissance to an enlightened Europe, and from there to modern Hellenism, a course which leads, in a term later coined by Korais, to the *metakenosi* (expulsion) of western knowledge and to the recovery of a traditional heritage of Classical learning.

The Byzantine "ecumenical" idea survived through the ecclesiastical edifice and in many ways through the Phanariot ideology, while the national awakening gradually taking place was based to a large degree on the recovery of the ancient heritage. The idea of orthodoxy continued to be identified with that of the *genos*. In the collective memory of the peoples of southeastern Europe, in popular tradition, and in legends, the

lost Christian empire was present. Moreover, the expectations for Russian intervention in the east were founded on the common religion. On the other hand there is the reconnection with antiquity. The "Classical vision" and its revival, a commonplace of European Classicism since the Renaissance, acquired greater force with the outbreak of the French Revolution – "heroic Neoclassicism" became a social experience. To a great extent, the Greek Enlightenment embraced these models.

The Neohellenic Enlightenment gave rise to a number of secondary phenomena which demonstrate not only its internal dynamics and development but also its individuality. According to the original division of Dimaras, we can speak of a period of 50 years, from 1770 to 1820, with a backward margin of 20 years, to include the events of the 1750s, and reaching to the 1830s, when the Enlightenment met the spirit of Romanticism. The disintegration of the Enlightenment began to be seen during the 1830s, although some cores of resistance remained until the 1850s, and even later.

However, in southeastern Europe the period from 1700 to 1750 can be equated with the "early Enlightenment" (*Frühaufklärung*). The Mavrokordatos family is a good example. Polyglots, and extremely cultivated, the family aligned themselves with the moderate ideals of enlightened authoritarianism (*despotisme éclairé*). They were exceptionally well informed about literature, maintained a much-envied library (their collections prompted the interest of Louis XIV and Colbert), and had contact with western men of letters such as Jean Le Clerc. They were without doubt equal citizens of the ideal Republic of European Letters. The family included Alexander "*o ex Aporriton*" ("Minister of the Secrets"), the head of the dynasty, and Nicholas, the first Phanariot prince of Moldavia (1709), who acted as vehicles for new ideas in ethics and political thinking (such as the theory of natural law) and knew the French *moralistes* (La Rochefoucauld). In Nicholas's novelistic work *Philotheou Parerga* (1713), we can see the influence of the great philosophical discussions of the age: "the *Querelle* of the Ancients and the Moderns", the morality of the spectacle, historical criticism, etc. Nicholas, breaking away from the established neo-Aristolenianism, turned towards Plato and makes reference to the philosophy of his contemporaries (Locke, Hobbes, Bacon). It is through the hegemonic Mavrokordatos family that the first signs of interest in modern western narrative forms, literature, the novel, and the theatre can be seen (Fénelon, Cervantes, Molière, Gracian y Morales, etc).

Theophilos Corydalleus, the 17th-century neo-Aristotelian philosopher, dominated the educational system of southeastern Europe for a long period, since his writings in the fields of logic and philosophy and his rhetoric were widely disseminated as teaching handbooks, and were in use until around 1827, when the Greek state was founded.

At the beginning of the 18th century can be seen the first faltering steps marking a rift, a gradual distancing from the absolute spiritual leadership of the Church, doubts over Aristotelianism, a turning towards the outside world and observation, the desire for historical knowledge, familiarity with the natural world, the environment, ultimately a faith in experimentation and empiricism. These changes are anticipated in *Introduction to Geographics and Spherics* (1716) by Chrysanthos Notaras, the patriarch of Jerusalem, although he disputes the position of Copernicus. The first examples of rationalist thought are encountered in the works of Vincentios Damodos, Methodios Anthracites, and Theodoros Cavalliotes. Damodos, without deviating from Orthodoxy, accepts the Cartesian theory concerning the genesis of the passions. The works of Methodios Anthracites were influenced by Malebranche. He expresses the movement towards mathematics and the natural sciences as well as an early eclecticism which would later prove to be one of the most fundamental features of the Greek movement. His teaching was condemned as heterodoxy in 1721. Finally, Theodoros Cavalliotes, from Moschopoli, was a student of Evgenios Voulgaris (1716–1806) in Ioannina. In his writings he refers to Descartes and Leibniz. The influences of the German *Frühaufklärung* on Greek culture later become more noticeable, particularly through the popularization of the writings of Leibniz and Wolff, Baumeister and Heinecke. After 1760 modern Hellenism began to become familiar with Italian thought: Muratori, Genovesi, Soave, Beccaria, and Vico.

As far as education is concerned, the 18th century was for the most part dominated by the coexistence of Classical and Byzantine learning: lyric and dramatic poetry, Classical and ecclesiastical rhetoric, admonitory texts, etc. This was characteristic both of the humanistic and of the exact sciences. The teaching of astronomy, of mathematics, and of geometry was dominated by the influence of 17th-century religious humanism. Theophilos Corydalleus, Chrysanthos Notaras, and Methodios Anthracites continued this Greek-Byzantine tradition, enriching it with new elements. They gave way to new, more radical generations, firmly oriented towards western thought. The desertion of tradition, the acceptance of a spirit of renewal and of modern scientific theories introduced from the west filtered through during the final third of the 18th and the first decades of the 19th century. However, it is rare to find serious examples of Christian dogma being disputed, and even rarer for cases of atheism to appear. The clash with the official Church would take place later, after the outbreak of the French Revolution.

Between 1750 and 1770 the characteristic features of the Greek movement were taking shape. There was a strong increase in publishing activity, the decline of ecclesiastical and service books, the cultivation of a systematic interest in history (ancient and modern), and the development of translation from foreign, western languages. It is then that we can observe the introduction of the exact sciences by Nikephoros Theotokis and of modern philosophy by Evgenios Voulgaris, who introduced the thinking of John Locke with his *Logic* (1766) and was the first to translate Voltaire with *Memnon* (1766) and *Essay on the Discord in the Church of Poland* (*Essai sur les dissensions des églises en Pologne*, 1767) to which he added his *Treatise on Religious Tolerance*, inspired by the French philosopher's famous *Traité sur la tolérance* as well as by the thinking of John Locke. He left us with the neologism *anexithreskeia* (religious tolerance). Vulgaris was attached to the model of enlightened authoritarianism, particularly during the time he spent as librarian in the court of Catherine the Great (1772–74). It was then that he translated a number of Voltaire's political pamphlets, with the aim of

increasing Russian influence in the eastern Mediterranean basin.

The appearance of Voltaire breathed new life into Greek intellectual life. Josephos Moisiodax also appears at this stage. He exemplifies the Hellenized Balkan scholar whose interests, including moral philosophy, geography, physics, mathematics, and pedagogics, reflected a vital curiosity. Among his writings, the *Apologia* (1780) is particularly important. He refers in his works to Newton and Locke, and in 1765, during a public lesson at which the prince of Moldavia was also present, he referred to Voltaire.

The second period of the Neohellenic Enlightenment thus extended from 1750 or 1760 to 1800. The first decades of the second half of the 18th century were distinguished by an increased occurrence of interrelated events. Contact with western thought became regular and more continuous, and changes in the way of life and in the way of thinking began to be noticeable and were manifested more strongly in urban centres. Renewal, as represented by the ascending urban merchant class, began to crystallize. Publishing strategies aimed mainly at education and the scholars (Moisiodax, Katartzis) who were the vehicles of the Enlightenment gave absolute priority to educational matters.

A number of innovations were applied in educational institutions, which began to multiply in widely disseminated centres of Hellenism, and reached their greatest number in the early 19th century, even if conservatism often coexisted with renewal: the Hegemonic Academies in Bucharest and Iasi, the Athonias, the Patriarchal School, schools in Epirus and western Macedonia (Ioannina, Arta, Metsovo, Kastoria, Kozani, Moschopoli, Siatista); Patmos; Ambelakia and Tyrnavos in Thessaly; Milies and Zagora in Pelion; Dimitsana, Chios, the School of Kydonies, the Evangelical School and the Philological Gymnasium of Smyrna, the Ionian Academy, etc.

The spirit of French encyclopedism gained ground. The second period, according to Dimaras, was characterized by the influence exerted by the French *Encyclopédie* in southeastern Europe. One of its most typical representatives was the Phanariot Dimitrios Katartzis (*c.*1730–1807) together with some of his students such as Rigas Pheraios, otherwise known as Velestinlis (1757–98). Information and theories were drawn from the French encyclopedia regarding the natural language, the general grammar, and the practice of translation (Katartzis); on the definition of the philosopher and the content of philosophy (Christodoulos Pamblekis, *On Philosophy*); and even on natural sciences (Rigas, *Physikis Apanthisma* [Physics Anthology]). The renewal of geography as a science was confirmed in a major work of the Neohellenic Enlightenment, *Modern Geography* (1791) by the Peliots Daniel Philippides (*c.*1755–1832) and Grigorios Konstantas (1758–1844), who took Marmontel's *Encyclopédie méthodique* as a model. This period of maturity gave clear priority to the exact sciences, to experimentation, which was considered a driving force, and the liberation of the individual from the shackles of ignorance and superstition. Finally, in the field of historiography, a long tradition of chronography was left behind, giving way increasingly to a developing interest in antiquity as well as the interpretation of the modern period (Rollin, Domenico Caminer, etc.). The modernization of structures, both social and intellectual, also began to spread at this time, and remained the dominant demand of the Enlightenment.

The French Revolution had its repercussions in the Balkans. Its outbreak and development allowed a radical spirit to be articulated, in which three focal points of expression can be discerned: the liberation movement of Rigas, the centres (Greek communities) of the diaspora, and Ionian radicalism (presence of French republicans in the Ionian islands, overthrow of the old feudal system, burning of the *libri d'oro*, manifestos, trees of freedom, Jacobin clubs, etc.). In 1791, in the *Ephimeris* of the Markidon Pouliou brothers, the *Manifesto of the Rights of the Individual and of the Citizen* was published. On the other hand, the revolutionary events and the excesses in France (the Terror, the regicides, etc.) would cause somewhat delayed negative protestations on the part of the official Church, or rather of the patriarchate, which reacted in 1797 or 1798 with a fulmination condemning the blasphemous philosophy of the French atheists Voltaire and Rousseau (*Patriki Didaskalia, Christianiki Apologia* [The Teaching of the Fathers: A Christian Defence]).

The practice of criticism, one of the fundamental demands of European thinking of the time, was articulated in Greece in three fields: cultural criticism, which already existed in texts such as *Modern Geography*; criticism of social structures, which was channelled into satirical texts at the beginning of the 19th century (*Rossanglogallos* [Russanglofrench], 1805) or into texts full of ideas of the Enlightenment or of national revolution (*Helliniki Nomarchia* [Greek Prefecture], 1806); and finally, criticism of the Church and of traditional religion. Of course, the Greek Enlightenment – as elsewhere in Europe – was not anti-Christian. The question of religion was for the Christian population of the multiethnic Ottoman empire, whether Orthodox or not, an extremely sensitive point, since religious diversity was a legal right, recognized by the Turks, which distinguished them and made them an entity in the face of authority. It was also a cohesive link with a single cultural tradition. There are very few examples of real religious dispute (*Anonymous*, 1789, *Peri Theokratias* [On Theocracy] by Christodoulos Pamblekis). Criticism was for the most part confined to anticlericalism, and demanded the purge and rationalization of religion, and a return to evangelical love and faith (e.g. Adamantios Korais).

In the field of ideas, the final decade of the 18th century focused on the search for a new ethic. If, during the period of the early Enlightenment, ethical questions had offered rich and fertile ground to the Mavrokordatos family, who followed the lead of the widespread form of the *Mirror of Princes* (the link of the ancient Graeco-Roman with the Christian sophiological tradition), from 1760 the search for a new moral philosophy was a serious concern of the modernizing men of letters. In 1760 Josephos Moisiodax translated Muratori's *Moral Philosophy*. Yet only in about 1790 did this process break away from the remaining theocratic morality and make its aim an earthly, anthropocentric happiness. Its natural, deterministic search and the harmonious symbiosis of the individual and his environment in a civil society are at the very centre of the issue raised by a host of books on ethics and behaviour (*True Path to Happiness*, *Handbook to Benevolence*, *Flower of Virtue and Knowledge*, etc.). Writers who used their works to popularize the new social ideal were published in adaptations

and translated extracts: Restif de la Bretonne, *Les Contemporaines*, which inspired the novellas of *School for Delicate Lovers* by Rigas (1790); the Utopian Louis-Sébastien Mercier, *L'An 2440 ou rêve s'il en fut jamais*, from which Stephanos Dimitriadis drew selections for his book, *Apanthismata* (Florilegium, 1797); or even the revolutionary *Catechism* of La Chabeaussière. In the final years of the century translations increased the number of works dedicated to the exact and natural sciences, and writers such as Montesquieu and Jean-Jacques Rousseau also appeared for the first time. But the recovery of antiquity, a process which assumed an ideological load and led to national awareness, was realized in many ways through the dissemination of the famous work of the Abbé Barthélemy, *Voyage du jeune Anacharsis*. The first volume was published in a translation by Georgios Sakellarios, while the fourth was translated by Rigas and Georgios Ventotis.

Between 1800 and 1830 the movement of the Enlightenment completed its course. This stage was the most dynamic, as it became involved with the ideological preparation for the national revolution of 1821. There was one aim: the enlightening of the *genos*, which would lead to national awakening and liberation. The exhortation of Korais for "the lights of Europe to be decanted" (*metakenosi*) was applied in a consistent and methodical manner. The colossal oeuvre of the grand old man of letters Adamantios Korais (1748–1833), particularly through the editions of ancient classics (the famous *Helliniki Bibliothiki* [Greek Library]) and the extensive annotations, is the most irrefutable evidence of the dialectical relationship which united the conquest of learning with the regaining of freedom. A moderate visionary of the national renaissance, associated with the French Ideologues and an adherent of their analytical theory, he represents a cohesive image of the final phase of the Greek movement through his writings and his famous linguistic and political proposal of the "middle road". The reading of ancient writers in the light of the social thinking of the Enlightenment constituted what has been termed the intellectual matrix of his political theory.

The admonitory and pedagogical character of the Neohellenic Enlightenment was at its peak. Korais and a host of scholars, including those who travelled in the same direction without their paths meeting, his supporters but also opponents of his theories, played a leading part (Athanasios Psalidas, Neophytos Doukas, Anthimos Gazis, Theoclitos Pharmakidis, Constantinos Kokkinakis, Neophytos Vamvas, Constantinos Oikonomos, Constantinos Koumas, Veniamin Lesvios, Stephanos Doungas, Theophilos Kairis, Panagiotis Kodrikas, etc.). Publications written with the purpose of moral teaching multiplied, as did schools and libraries, while literary journals made their first appearance: *Hermes o Logios*, *The Hellenic and Philological Telegraph*, *Athina*, *Calliope*, and *Melissa*. There was a close relationship between most of the prerevolutionary publications and the journals of the Ideologues. The first public theatrical productions clearly prompted by national revolution took place. The heroic, revolutionary Neoclassicism of the French and the scientific theories of the Ideologues influenced the Greeks to a significant degree: Cabanis, Thurot, Condillac, Lalande, Brisson, Volney, Destutt de Tracy (*Eléments d'idéologie*), and even Daunou's views on history, the Hellenists, Etienne Clavier, D'Ansse de Villoison, the orientalist Silvestre de Sacy, the linguistic theories of De Gérando, the political economy of Jean-Baptiste Say.

Paris on the one hand, Vienna on the other, shaped the "new philology of the Greeks". Nor were German influences by any means insignificant. Increasing numbers of young men from the Balkans studied in German universities at the end of the 18th and beginning of the 19th century. The philosophical spirit of Kant and Schelling, the example of Goethe, and a host of other names entered Greek intellectual life through their writings, which were translated or used for educational purposes: the philosophical ideas of Wilhelm Traugott Krug; the historical views of Johann Christoph Gatterer, Julius August Remer, Mathias Schröck, and Johann Gottfried Gruber; the pedagogics of Joachim Campe; the literary works of Salomon Gessner, Christoph Martin Wieland, and August Kotzebue; the aesthetic ideas of A.G. Suilzer, etc.

The Neohellenic Enlightenment was receptive to and eclectically assimilated different tendencies characteristic of the corresponding western movements. Its end was in fact a beginning in the political history of the Balkans: if the age of Rigas had seen the Utopian idea of a multiethnic Balkan state called the "Hellenic Republic", the Enlightenment concluded in the formation of the modern states. The Balkan century of the Enlightenment exploited the multiethnic Ottoman empire. On this basis, and after a long period of awakening, it acted as a catalyst in the emergence of national traditions.

Enosis

The newly formed Greek state, first ruled by Count Ioannis Kapodistria (1828–31) as its *Kyvernitis* (President) and then by king Otho (1833–62), contained only a minority of the Greek people. The majority were still living under Ottoman rule, while the Ionian islanders had been under British protection since 1815. Although the desire for *enosis*, unification (with Greece), led to agitation in the Ionian Islands, unrest in Crete, and repeated infiltration by nationalist armed bands in Ottoman-occupied Thessaly and areas beyond, there was no extension of the country's borders before the reign of king George I (1863–1913). As a gesture of good will towards the new king, Britain ceded the Ionian islands to Greece (1864). Insurgency continued in Crete, most notably in 1866–69, and another revolt broke out during the Russian-Turkish War of 1877–78. Concurrently, Greek irregulars carried out raids in Thessaly and Macedonia, while the Greek army was mobilized. Following the Congress of Berlin (1878), the Great Powers invited the Porte to make some frontier concessions; it was only after Greek mobilization and pressure by the Powers, however, that the Turks agreed to yield Thessaly and the Arta region to Greece (1881). In the wake of another Cretan revolt, in 1895, Greece went to war with Turkey but suffered a humiliating defeat (1897). The one positive outcome of the peace settlement was that Crete was given autonomous status under Ottoman suzerainty and prince George (king George's second son) was appointed High Commissioner on the island. After two more unilateral proclamations of *enosis* (1905, 1908), Crete was formally united with the mainland at the end of the Balkan Wars. Meanwhile, multi-ethnic Macedonia was the scene of guerrilla warfare; largely ignited by Bulgarian expansionist initiatives, it was not so much directed against the Turks, but rather waged between Greek and Slav nationalist bands, reaching its culmination during the years 1904–08.

For many of those Greeks living under Ottoman rule the wish for *enosis* was fulfilled with the Balkan Wars (1912–13) when, under the premiership of Eleftherios Venizelos and in alliance with Serbia, Bulgaria, and Montenegro, Greece declared war on the Ottoman empire. The allies achieved swift and spectacular victories but disputes over the spoils led to a second war, with Bulgaria attacking Greece and Serbia and being defeated by them. Greece emerged from these conflicts having secured most of the territories contained within its present boundaries. After the end of World War I and the Treaty of Sèvres (1920) the dream of a greater Greece extending into Asia Minor, cherished for generations and known as the "Great Idea", seemed briefly realizable. Such hopes were abruptly ended by the Asia Minor Catastrophe (1922). Over a million Greeks were forced to leave their native land and flee to Greece. Following the end of World War II, with the Treaty of Paris (1947), Italy was obliged to give up the Dodecanese, which it had seized from the Ottoman empire in 1911. A year later, in 1948, these islands were formally united with Greece.

After the Asia Minor Catastrophe, the subsequent exchange of populations (1923), and the Dodecanese settlement, the largest remaining area predominantly peopled by Greeks outside the confines of the Greek State was Cyprus. Here, too, the call for *enosis* had a long history. In August 1828 the archbishop, the bishops, and other notables of Cyprus sent a letter and a deputation to Kapodistria asking for his help. This led him to recommend to the British, French, and Russian ambassadors to the Porte, soon to meet on Poros to consider proposals for the frontiers of Greece, that Cyprus and Rhodes be included within the national boundaries. In 1830 an agent was again sent to Kapodistria, this time to persuade him to annex Cyprus to Greece. As he was obviously unable to do anything about it, the enterprising Cypriots took it upon themselves to turn the island into "a Greek colony". The relevant section from a report (1831) the British consular agent in Cyprus sent to the consul-general in Constantinople reads:

> In several of my reports I have called your attention to the emigration of these islanders; the bulk of them go to Greece and return to their native country with Greek passports, which are accorded easily and without delay. Thus they enter again into possession of their goods and their houses, exempt from all tribute and with the privileges of the Franks. To such an extent has this process been adopted by peasants and persons of all conditions, that, were it to continue the island would shortly become a Greek colony, and the Sultan be left with the empty title of suzerain (*padrone*). An order has therefore been issued that these persons must revert to the category of *rayah* [subjects]; several have already been arrested, and it appears that rigorous measures will be taken to check this practice.
>
> (Luke, 1921, p. 169)

By the Cyprus Convention of 1878 the Ottoman government agreed to British occupation and administration of the island; the sultan was to retain his sovereignty over it and the

Enosis: demonstration in Pirgos in the Peloponnese in support of Cypriot demands for unification with Greece, 1955

British undertook to pay to the Porte the surplus of revenue over expenditure. This change of administration, ending three centuries of Ottoman rule, was particularly welcome to the Greek Cypriots both in its own right and because they saw it as the first step towards unification with Greece – the ceding of the Ionian islands was still very fresh in everybody's mind. Writing in the late 1940s, the island's historian George Hill devoted a whole chapter to "The Movement for Enosis". He offered an apology for tracing its history at such length and sought to forestall any criticism by the reader: "The constant repetition of the same cry may be tedious, hut it proves the persistence of the movement, and gives some impression of what the administration had to face. ...Hardly a year has passed since the [British] Occupation without the 'Hellenic idea' finding expression in some form or other" (Hill, 1952, 4. 495–96).

In 1914, with the Ottoman empire entering World War I on the side of the Central Powers, Cyprus was formally annexed to the British Crown. A year later Britain offered to cede the island to Greece if the latter were to enter the war on the side of the Entente powers. Divided as it was at the time on the issue of war, the Greek government refused the offer. In 1923, by the Treaty of Lausanne, Turkey recognized British sovereignty over Cyprus, which was proclaimed a Crown colony two years later.

In October 1931 pro-*enosis* agitation, coupled with resentment over newly imposed duties and taxes, led to violent demonstrations which, in Nicosia, resulted in the burning down of Government House. The administration, already hardening its position since the late 1920s, adopted a series of repressive measures which were only partly relaxed at the beginning of World War II. As in World War I, thousands of Greek Cypriots once again enlisted voluntarily in the British forces. The conviction grew that, if the Allies were successful, their participation in the Middle East campaigns and Greece's role in the war effort would bring the reward of *enosis*. Yet, the attempts made by the Greek government to raise this issue, during and just after the war, fell on deaf ears. The Cypriots were told that there would be no change in the status of the island, which was to remain under British sovereignty, and were offered instead constitutional reforms, the re-establishment of the Legislative Council (dissolved since 1931), and a ten-year programme of social and economic development. These proposals were welcomed by the Turkish minority (representing 18 per cent of the population) and rejected by the Greek majority (representing 80 per cent of the population), who insisted on their demand for union with Greece. In January 1950 a plebiscite organized by the Orthodox Church among Greek Cypriots produced a 95.7 per cent vote in favour of *enosis*.

Towards the end of 1952 Archbishop Makarios (1950–77) asked the newly elected Greek prime minister, field-marshal Alexandros Papagos, to take the Cyprus question to the United Nations. Favouring a direct approach to the United Kingdom first, Papagos raised the matter with the British foreign minister, Anthony Eden, but was rebuffed. His attempt, moreover, to

bring the question of Cypriot self-determination before the General Assembly of the United Nations in 1954 was unsuccessful. A serious consequence of this failure was that on 1 April 1955 the armed struggle began in Cyprus under the banner of EOKA (*Ethniki Organosis Kyprion Agoniston*, the National Organization of Cypriot Fighters) headed by George Grivas, a retired colonel of the Greek army, who adopted the codename "Digenis". The British government responded by sending troops and field-marshal Sir John Harding as governor and commander-in-chief. Emergency laws were imposed, imprisonments, torture, and executions took place. It would be idle to deny the effectiveness, courage, and heroism of the EOKA fighters. It would also be idle to deny that during the period they were active (1955–58) innocent people were killed. Moreover, intercommunal strife became inevitable with the formation of TMT (*Türk Müdafaa Teskilati*, the Turkish Defence Organization), an anti-EOKA Turkish Cypriot underground organization.

The year 1955 also saw Turkey being brought into the picture. According to the historian Richard Clogg (p. 172), "The British authorities sought to use the Turkish community on the island as a counterweight to the demands of the Greek Cypriots and the Turkish government, which had hitherto been rather indifferent to the fate of the Turks on the island, was encouraged to consider itself as having an interest in the island comparable to that of Greece." In June the British government invited Greece and Turkey to a tripartite conference to discuss a qualified degree of home rule in Cyprus. On 6 September, a day before the discussions ended in failure, an organized outburst of violent "popular anger" broke out in Istanbul; it was aimed at the then 100,000-strong Greek minority. Negotiations between Harding and Makarios likewise broke down in the following year; the latter was deported to the Seychelles, not to be released until April 1955, and even then he was forbidden to return to Cyprus. During 1955 the question of Cyprus was discussed at the United Nations and a resolution was passed expressing the wish that a settlement be reached in accordance with the principles of the UN. Yet, with the Greeks insisting on *enosis*, the Turks on partition, and the British pressing for a seven-year-long period of transition during which the three countries would "partner" each other in the administration of the island, the situation was at an impasse. In September 1958 Makarios indicated that he was prepared to accept independence instead of *enosis*. After that events moved swiftly: talks in Paris between the foreign ministers of Greece and Turkey were followed by talks in Zürich between Constantine Karamanlis, the successor of Papagos (who had died in 1955), and his Turkish counterpart Adnan Menderes. A draft agreement resulted. This was finalized in London, ratified by the prime ministers of the United Kingdom, Greece, and Turkey, and presented for signing to the leaders of the two Cypriot communities, Makarios and Dr Fazil Kutchuk (February 1959). Accordingly, Cyprus was established as an independent republic on 16 August 1960 and admitted to the Commonwealth in March 1961.

It soon became clear that the constitution of the new republic was unworkable, and in November 1963 president Makarios presented 13 proposals for amending it to vice-president Kutchuk; he rejected them, but only after the Turkish government had done so. Amid mounting frustration and mutual distrust, intercommunal fighting broke out on 21 December. The months that followed saw further conflict between the two communities, the return of General Grivas to the island, Turkish air raids, an increase by Greece and Turkey of the number of troops officially permitted to them in Cyprus, and Turkish Cypriots concentrating in enclaves. British troops from the bases at Dekelia and Akrotiri (over which the United Kingdom retained sovereignty) were sent to Nicosia as peacekeepers, to be replaced in March 1964 by a UN peace-keeping force, and the American president, Lyndon Johnson, twice intervened to warn the Turkish government against invading the island. Moreover, Johnson entrusted the former secretary of state, Dean Acheson, with the task of reporting on Cyprus and its future. The solution Acheson proposed was a kind of double *enosis*: the republic would be dissolved and most of the island would be united with Greece, but its northern part would become a Turkish military base as well as a political canton. A number of other Turkish cantons would exist autonomously within the Greek part of Cyprus and, in addition, Greece would cede to Turkey the small island of Kastellorizo. The Turkish government accepted the plan only as a basis for negotiations; Makarios rejected it outright and, after some initial hesitation, so did the Greek government led by George Papandreou. Nevertheless, in its essential features, the Acheson plan continued to exert its influence on subsequent developments.

In the polarized atmosphere of the cold war, Makarios's increasingly neutralist foreign policy and independent line were not to the liking of the West. He had rejected the Anglo-American proposal for a NATO peace-keeping force insisting on a UN one, he was prepared to appeal to the Soviet Union, and he sought the support of non-allied countries; by rejecting the Acheson plan, moreover, he effectively kept Cyprus out of the reach of NATO, of which both Greece and Turkey were members. The Americans were suspicious of him and the Greek government itself, though siding with him over the Acheson plan, had allowed Grivas to return to Cyprus and help organize the Cypriot National Guard. Ready to fight for *enosis* in any form, Grivas was thought of as a counterweight to Makarios.

With the Greek coup d'état of 1967 the situation deteriorated. At a conference between the Greek and Turkish governments in September of the same year the Greek side proposed *enosis* based on a modified version of the Acheson plan; but this was rejected by the Turkish delegation. An attack by Grivas on two Turkish Cypriot villages shortly after brought about an ultimatum from Turkey. The Colonels capitulated over the Turkish demands and recalled Grivas and all Greek troops exceeding the 950 laid down by the Zürich and London agreements.

Although relations between the Greek junta and the Republic of Cyprus remained formally (if frigidly) correct, the Colonels became convinced that *enosis* could only be achieved if Makarios was removed from the scene. Allegedly behind an attempt on his life in 1970, in the following year they also helped general Grivas to return to Cyprus clandestinely and organize EOKA-B, an extremist right-wing, pro-*enosis*, underground organization. There followed, on 15 July 1974, a coup against Makarios inspired by the junta and staged by the Cypriot National Guard. Nikos Sampson was installed as pres-

ident, but contrary to the conspirators' plans, Makarios had managed to escape and was flown, via Malta, to London. The Turkish government urged the British to take joint action in order to restore the status quo, but as they declined, Turkey acted unilaterally under the 1960 Treaty of Guarantee and invaded Cyprus from the north on 20 July. The UN Security Council passed a resolution calling for a ceasefire which became effective on 22 July and was broken a few days later.

Meanwhile, following mobilization which also proved a fiasco, the Greek junta collapsed and with it the Sampson regime. In Makarios's absence, Glaphkos Clerides, president of the House of Representatives, took over as acting president of Cyprus. Karamanlis was invited from his self-exile in Paris to restore democracy to Greece. He arrived in Athens in the early hours of 24 July, was sworn in as prime minister, and formed a government of national unity. The foreign ministers of the three guarantor powers (the United Kingdom, Turkey, and Greece) met in Geneva and, on 30 July, signed a ceasefire. Talks at the second Geneva Conference, convened to seek a political solution, collapsed on 14 August. Within hours the Turkish forces went on the offensive, advancing until they reached their objective, the so-called Attila Line. After repeated UN Security Council resolutions calling for the termination of the military operations, the withdrawal of all foreign troops in the island, and the resumption of talks, a new ceasefire was signed on 16 August; it proved more lasting, but by then the Turkish army was in control of almost 40 per cent of the island and some 180,000 Greek Cypriots had fled that area.

President Makarios returned to Cyprus in December, and in January 1975 talks began between Glaphkos Clerides and Rauf Denktash, representing the two communities which were becoming increasingly concentrated in the south and the north, respectively. The following month Denktash proclaimed the Turkish-occupied north the "Turkish Federated State of Cyprus" and, in November 1983, the "Turkish Republic of Northern Cyprus". In either case, Denktash's state has not been recognized by the international community (with the exception of Turkey and Pakistan). In November 1975 a resolution had been passed by an overwhelming majority of the UN Assembly calling for the withdrawal of all foreign troops in Cyprus, the return of the refugees to their homes, and the resumption of peace talks under the aegis of the Secretary General. The years that followed have been marked by talks and UN resolutions, by fresh initiatives and further negotiations; yet little progress towards a solution has been made to date.

Enosis was specifically excluded by the 1960 settlement, but hope for an eventual *enosis* was too deeply rooted to be abandoned so easily. It persisted for another 14 years affecting individual actions and national policies. It is true to say, however, that although Greece remains the natural ally and traditional advocate of the Greek Cypriots, since the tragic events of 1974 the *enosis* dream has been laid to rest.

Epaminondas

Theban statesman of the 4th century BC

Epaminondas, son of Polymnis, sprang from a venerable family, distinguished by birth but not by political accomplishments. His date of birth is unknown, but he received an excellent education in music and dance, rhetoric, and especially philosophy. During his early adult life he participated in the liberation of Thebes from Spartan occupation, but played no conspicuous role in the years of subsequent fighting. Epaminondas came to the fore in 371 BC when at a Panhellenic peace conference he defied the authority of Sparta and its king Agesilaus. When the Spartans invaded Boeotia later that year, he commanded the Theban army. At the Battle of Leuctra he crushed the enemy by a combination of brilliant tactics and superbly trained troops, destroying Sparta's ascendancy in Greece. In its place he established the Theban hegemony, which lasted until 362 BC, and made possible Theban predominance well into the Sacred War of 355–346 BC.

Anger over Spartan policies had long alienated many of the Peloponnesian states, and the victory at Leuctra released this pent-up animosity. Elis, Arcadia, and Argos allied with Thebes in 370 BC to oppose Sparta, and Agesilaus' ineffectual efforts to disrupt Arcadia provoked a military campaign by the new allies. Epaminondas and Pelopidas led the combined army on a massive invasion of Laconia. They assaulted Sparta unavailingly, but immediately turned their attention to ravaging unspoiled Laconia. Epaminondas next led them to Messenia, which they liberated from Sparta. The emancipated Messenian helots joined the allies, and together they encircled Sparta. Epaminondas directed the building of Messene, the capital of the new polis, in 369 BC. Next year he helped the Arcadians to build their new capital at Megalopolis.

On their return to Thebes, both Epaminondas and Pelopidas were tried by envious political opponents, but won easy acquittal. Reassembling the army, Epaminondas again in 369 BC penetrated the Peloponnese, but this time his target was Corinth and its surrounding allies. Although he devastated Corinthian territory and attacked the capital, his army were unable to do the well-fortified city any real harm. He was more successful in assailing neighbouring Sicyon, Epidaurus, Troezen, and Pellene. Though hardly spectacular, Epaminondas' gains deprived Sparta and Corinth of additional allies and denied them a portion of the northeastern Peloponnese.

Epaminondas' Peloponnesian policy had achieved remarkable results in a short time, but events in 368 BC proved that his work was inadequate. Athens had concluded an alliance with Sparta the previous year, but as yet was more of a nuisance than a threat. Of greater urgency was a serious dispute between Elis and Arcadia over the border territory of Triphylia. The two states were the warders of Sparta, and enmity between them threatened to undo all of Epaminondas' work. The quarrel also underlined a fundamental flaw in his system of alliances, from which he cannot be absolved. At the creation of the alliance, all members tacitly but actually acknowledged Theban hegemony. Yet this understanding was never formally endorsed. Nor was there any joint body or *synedrion* to resolve differences among the allies. In this diplomatic arena the Theban army was of little use, for armed intervention against any of the city states would disrupt the entire alliance. An additional fault was Epaminondas' failure to apply diplomatic pressure in order to obtain a peaceful solution to the problem. As a result, the quarrel split the alliance. Mutual and antagonistic ambitions did more damage to the united front than Sparta could ever have done. Thereafter, Epaminondas faced the relatively easy problem of Sparta and the far thornier matter of his allies.

Further diplomatic failure confronted Thebes in 366 BC, when Pelopidas won the approval of the Persian king for a new general peace, only to see its wholesale rejection in Greece. The affair ended in deep embarrassment. Epaminondas tried to recover Theban fortunes by another military expedition, this one aimed at Achaea, but the effort was pointless, because Achaea had hitherto neither supported Sparta nor opposed Thebes. Achaea fell easily, but unpopular Theban measures soon goaded a strong group of Achaeans to throw off its authority. Moreover, Achaea immediately joined Sparta, which additionally weakened the Theban position within the Peloponnese.

One of the oddest episodes of the Theban hegemony is Epaminondas' naval programme, which grew out of the Theban–Persian accord of 366 BC, and was aimed at Athens, despite the fact that Thebes had suffered virtually nothing at Athenian hands, and the project was of little strategic value to its ambitions. The Persian king subsidized the construction of 100 triremes and in 364 BC Epaminondas put to sea. At the end of the summer he returned to Boeotia without results – and nothing more is heard of his fleet.

The final crisis for both Epaminondas and Thebes stemmed from the breakdown of their system of Peloponnesian alliances. By 362 BC the Peloponnesians were at open war with one another, Theban leadership disregarded, and Spartan resurgence a distinct possibility. Realizing that Thebes had virtually lost control of the situation, Epaminondas intervened to re-establish its authority. He led an army of 25,000–30,000 men against a coalition of Sparta, Athens, Elis, and some Arcadians, numbering some 22,000 soldiers. Epaminondas encamped at Tegea, his enemies at Mantinea in the Arcadian plain. The Spartans were late to arrive, so he seized the opportunity to attack the unprotected city of Sparta, but was repulsed. He retraced his steps without hesitation, and with his cavalry made a surprise stab at Mantinea, which also failed. Pitched battle was now the only option. He confronted the enemy south of Mantinea; and, as at Leuctra, drew up his striking force on the left with his allies on the right. Opposite him were the Spartans under Agesilaus. Epaminondas' men charged and cut through the Spartan line easily, but at the height of the action Epaminondas fell, mortally wounded. This effectively ended the battle: Epaminondas died on the field, and with him died the Theban hegemony.

Epaminondas had raised Thebes to the height of its power, but he alone could not sustain its position. The Theban hegemony proves rather that no one state could bring political unity to Greece. None the less, Cicero considered Epaminondas first among the Greeks, and most Greeks considered him the architect of the hegemony. The western intellectual tradition has uniformly held him as the model of the noble, far-sighted, and virtuous philosopher-statesman. He was also the paradigm of the cultured gentleman and man of action. A modern statue of him still stands in Thebes.

JOHN BUCKLER

Biography

Epaminondas, whose date of birth is unknown, came from a noble Theban family and received a good education. In 371 BC he represented Thebes at a Panhellenic peace conference at Sparta and made his mark by defying Sparta's king Agesilaus. Re-elected a Boeotarch, he led the Thebans at the Battle of Leuctra which destroyed Spartan supremacy and established Theban hegemony. He was killed in the Battle of Mantinea in 362 BC and Theban hegemony of Greece died with him.

Ephesus

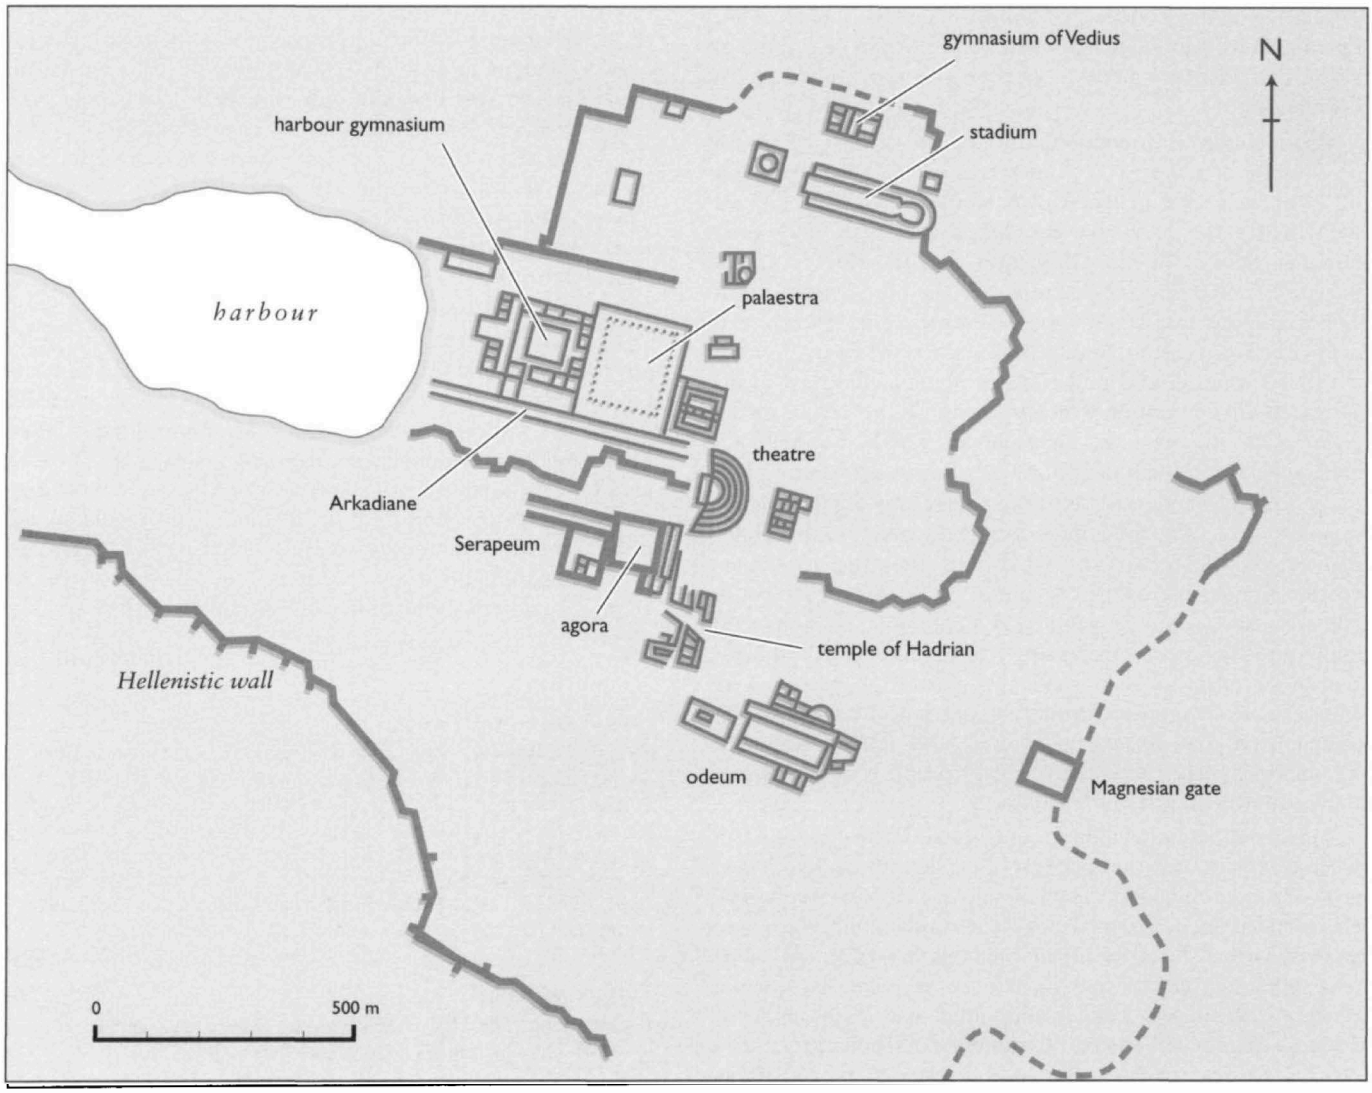
City in western Asia Minor

Ephesus, which became the greatest city of Asia Minor, was a centre of Hellenism for over 2,000 years. According to tradition it was founded by Androclus, son of the king of Athens, in the 10th century BC. He chose a defensible site on a gulf near the mouth of the Cayster river. Ephesus thrived as an independent city through the Archaic period, becoming a centre of the Ionian renaissance. It adopted the worship of a local goddess identified with Artemis, whose images and priests, however, retained distinct local characteristics. Her first temple was destroyed by the Cimmerians in the 7th century BC.

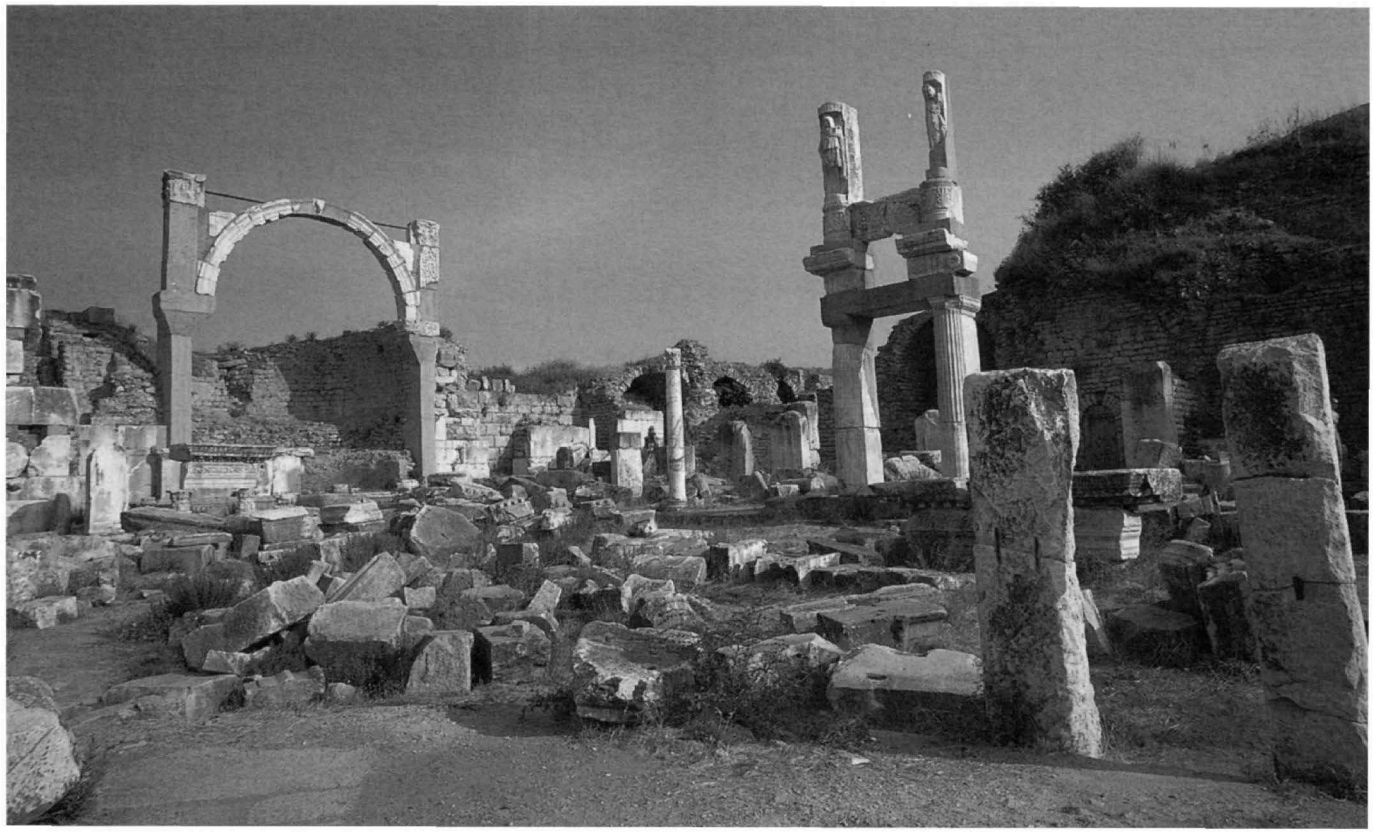
Croesus of Lydia conquered the city in 560 BC, and moved its inhabitants to a new site near the new temple of Artemis, which he adorned with elaborate columns. Despite its incorporation into the Persian empire in 547 BC, the city retained considerable autonomy and flourished as a centre of Greek culture. Its most famous sons were the philosopher Heraclitus and the satiric poet Hipponax.

Ephesus supported the Ionian revolt of 499 BC, and in 478, now independent, joined the Delian League, where its high tribute marked it as one of the richest members. The Persians took it again in 387 BC, and held it until its capture by Alexander the Great in 334. Alexander made generous gifts to the temple of Artemis which had been burned in 356 BC, on the night when he was born. The new temple, built on an even grander scale, was soon recognized as one of the seven wonders of the ancient world. It functioned as a financial centre, and had the right of asylum.

Because of silting of the harbour, Lysimachus, who controlled the region from 287 to 281 BC, moved the city to a new site, where it flourished until the Middle Ages. The new Ephesus had a rectangular street pattern, with a great theatre and agora in the centre. The major remains of his work are the



21. Ephesus



Ephesus: remains of the city centre which was the greatest Roman city of Asia Minor

massive fortifications, 10 km long. Ephesus was subsequently ruled by the Seleucids and Pergamum until it became Roman in 133 BC. Despite joining Mithridates in 88 BC, the city remained a major centre, receiving the visits of Cicero and Mark Antony, who made a dramatic entrance in the guise of Dionysus.

Ephesus reached its height under the Roman empire, when it was the residence of the proconsul of Asia (the most famous was the future emperor Antoninus Pius), and seat of the imperial cult. Surviving remains illustrate the growth that made it one of the three largest cities of the eastern half of the empire. They include four huge gymnasia, the theatre, stadium, agora, library, civic centre, temples, lavish houses, and streets paved with marble and lined with colonnades. The greatest monument was still the temple of Artemis, on the ancient site. Building activity was most intense in the 2nd century AD.

By that time, Ephesus had become a centre of Christianity and home of some of its most sacred sites. St Paul visited in a famous and well-documented scene (Acts 19). An ancient tradition had St John and St Timothy buried here and a legend associated the last years of the Virgin Mary with the city.

Although a Gothic attack in AD 262 destroyed much of the centre, late antiquity brought revival and continuing prosperity. The Roman city was maintained but transformed. Temples were destroyed and used as quarries, churches were added to the urban fabric, and bazaars grew up along the colonnaded streets. Mosaics and wall paintings produced a colourful impression. Ephesus took on a distinctly Christian appearance, most notably in two great churches. St Mary's, built into the ruins of the precinct of Hadrian's temple, was the seat of two church councils, the Third Ecumenical Council of 430 which established the adoration of the Virgin, and the so-called Robber Council of 449, not recognized by the Orthodox Church. These meetings brought an influx of visitors and widespread public disturbance as the various doctrines were debated and fought over. The church of St John, built over the apostle's tomb on the hill above the temple of Artemis, was rebuilt in the 6th century on a grandiose scale by Justinian I. It soon became the seat of the metropolitan bishop, and the goal of pilgrims from every part of the empire. The 5th century had added another holy site, the tomb of the Seven Sleepers, youths who had survived persecution by miraculously sleeping for 200 years. This, too, became a goal of pilgrimage.

Large parts of the city were destroyed in the early 7th century, probably by the Persians. They were followed by the Arabs, who occupied it in 654. Ephesus never recovered. The medieval city was confined to a small part of the ancient centre, surrounded by new walls built from the remains of earlier buildings. Although this site had remained an important port and seat of a large regional fair, silting of the harbour caused the centre to shift to the heavily fortified community around the church of St John by the 11th century. Consequently, medieval Ephesus is usually called Theologos, a title of the saint. Pilgrims continued to visit the apostle's tomb through the Byzantine period, especially to collect the sacred dust, or manna, that issued from the tomb and supposedly had miraculous powers.

Byzantine (and Hellenic) Ephesus flourished for the last time under the Laskarids (1204–61) when it was an important centre of education and home of the greatest scholars of the

time. The Turkish conquest of 1304 introduced a period of renewed prosperity, the greatest since the 6th century, but Ephesus was now a Turkish city. The Greek population rapidly disappeared or was converted, and the church of St John became a mosque. It was finally destroyed in civil wars in the early 15th century. In the Ottoman period, only a few Greek Christians remained in a declining town that suffered from malaria and nomadism. The arrival of the English archaeologist John Wood in 1863 introduced a period of revival. His discovery of the temple of Artemis was the prelude to the extensive excavations that the Austrians have been carrying out successfully since 1895, revealing the ancient city.

CLIVE FOSS

Summary

A city on the west coast of Asia Minor, Ephesus was a great centre of Hellenism for over two millennia, from the 10th century BC to the 13th century AD. It was best known for the temple of Artemis which was one of the Seven Wonders of the Ancient World. It flourished in the Classical and Hellenistic periods and reached its height under the Romans, prospering until the 6th century AD. As a centre of Christianity it was the site of the Third Ecumenical Council and the tomb of St John. Though devastated in the 7th century, it remained Greek until the early 14th century.

Ephorus

Historian of the 4th century BC

Ephorus was a major historian of the 4th century BC who came from Cyme in Aeolis (Asia Minor). The tradition is unanimous that he studied at Athens under Isocrates, and in fact the surviving fragments and that part of the text of Diodorus Siculus that is based on Ephorus (Ephorus' own works are all lost) preserve an unmistakable Isocratean flavour. Equally in evidence is a strong admiration for Athens. Apart from his main work, the *Histories*, we hear, *inter alia*, of a local history of Cyme, a book on literary style, and one on discoveries.

The *Histories* were a general, or universal, history from the Dorian invasion up to Ephorus' own day that, while concentrating on the Greeks, tried also to include the actions and achievements of non-Greek people, to the extent at least that these impinged on Greece. In this respect he was following in the footsteps of Herodotus rather than Thucydides; and not only in this, but also in his broader interpretation of history and its scope. For instance, two whole books were devoted to geography, and in the early books necessarily, but in the later historical books as well, whenever appropriate, he related much that was known in the 4th century BC about Greek colonization and the foundation of cities (reputedly an Ephoran speciality), ethnology, religion, culture in general, and science. According to Polybius, Ephorus was the only historian (apart from himself of course) to have attempted a universal history. Herodotus had been inspired to write what he did by the titanic clash between east and west, Europe and Asia, Greeks and barbarians (led by Persia), which culminated in the crossing of Xerxes from Asia to Europe in 480 BC where he met with defeat and disgrace. The unification of Greece under Philip of Macedon and the reverse crossing of Alexander the Great from Europe to Asia in 334 BC, which resulted in the conquest of the Persian empire, a stupendous event, would appear to have provided Ephorus with his main theme: he had intended to cover the period of Greek (and related barbarian) history from the return of the Heraclidae (the Macedonian royal house claimed descent from Heracles) in the 11th century BC to 334 BC, but he was forced (by old age or illness) to stop with the year 341/40 BC, having written 29 books. A 30th book was added by his son Demophilus, which still did not complete Ephorus' original purpose.

Ephorus was above all a didactic historian. In line with most contemporary historiography he wrote primarily for the purpose of instructing. The moral appraisements of public men (praising the good and censuring the bad) that we find in books 11 and 15 of Diodorus Siculus had their origin in Ephorus, who in turn applied to historical writing Isocratean theory on the subject. Rhetoric and a fine style, whether in writing or in speaking, were not ends in themselves for Isocrates, but merely tools to be employed, along with anything else that could be so utilized, for the attainment of correct, virtuous conduct, above all by political leaders. Writing at a time when Greece had succumbed to Macedon, Ephorus, naturally enough, sought to explain the collapse of the leading states of Greece and the rise of Macedon: ethical and pious conduct, whether by individuals or by states, in private no less than in public life, was Ephorus' (and Isocrates') recipe for success, one entirely in keeping with conventional Greek morality. For Ephorus, therefore, the failure of Greece was essentially a moral matter, as was also Philip's corresponding success.

Conventional in his outlook, as a historiographer Ephorus was nevertheless highly innovative and influential. He appears to have been the first writer to divide his work into books, providing each with its own preface. Within books events were narrated, in so far as it was possible, from beginning to end without interruption, and they were grouped together so as to form a thematic unity. There can be little doubt that this was a conscious attempt to improve on the annalistic presentation of Thucydides and the Oxyrhynchus historian, both of whom Ephorus employed as sources. The belief, almost universally held by scholars, that, always and as a matter of principle, each book was devoted exclusively to the history of one of the four major regions with which the *Histories* were concerned, that is, mainland Greece, the west, the east (Persia), and (after 360 BC) the north (Macedonia), can be shown from the fragments and the text of Diodorus Siculus to be wrong. Ephorus' method was not inflexible. Events from different regions were often

related in close sequence in the same books, with any connections between them highlighted.

Often uncritical in the use of his sources, prone to exaggeration (for example, he habitually inflated figures for barbarian forces, even when he knew better), and to smoothing over difficulties, Ephorus falls short of the high standards of the greatest of the Greek historians. Even so, his achievement in composing for the first time a general and systematic history of the Mediterranean world was considerable, and the *Histories* remained canonical reading for as long as the ancient world was able to handle works on such a scale. Its popularity is indicated by the extent to which it was used and imitated by other writers. Diyllus, the Athenian historian, made the year 340 BC (where Ephorus broke off) the starting-point of his own general, Greek and barbarian, history. Strabo, the eminent geographer, made extensive use of Ephorus, quoting him on numerous occasions; and of course much of the surviving work of Diodorus Siculus is in essence Ephorus, abridged and paraphrased. We would have a much poorer understanding of the 4th century but for Ephorus, as he has come down to us in Diodorus.

P.J. STYLIANOU

Ephorus

Born c.400 BC at Cyme in Aeolis in Asia Minor, Ephorus seems to have been a pupil of Isocrates at Athens. His principal work was the Histories in 30 books, a universal history from the Dorian invasion to his own day (the last book was written by his son). He also wrote a local history of Cyme, a book on style, and a book on discoveries. All his works are lost, but the Histories was an important source for other historians, notably Diodorus Siculus. He died in the 320s BC.

Ephraim the Syrian, St *c.*306–373

Poet and theologian

The Syriac poet and theologian Ephraim lived most of his life in Nisibis, a border town on the eastern frontier of the Roman empire (modern Nusaybin, in Turkey), serving as a deacon under St James, bishop of Nisibis (died 338) and his successors, until 363, when the town was ceded to the Persians following the death of the emperor Julian. Ephraim moved to Edessa (modern Urfa, also in Turkey), where he spent the last ten years of his life (he died on 9 June 373). Although he was often described and portrayed in later tradition as a monk, he was not a monk in the later sense, but a member of the *bnay qyama*, which can variously be translated as "members of the covenant", or "sharers in the pact, or promise", who undertook certain ascetic promises (probably at adult baptism) but continued to live and work within the urban (or village) Christian community. His extensive Syriac writings consist of: (1) lyric poems (*madrashe*), some 500 of which survive; (2) narrative poems (*memre*; the authenticity of many of these is uncertain); (3) artistic prose (a homily "On Our Lord" and a letter to Publius); and (4) ordinary prose (works against Marcion, Bardaisan, and Mani; commentaries on Genesis, part of Exodus, the Diatessaron, Acts, and the Epistles, the last two of which survive only in Armenian translation). Although many of these works already feature in the great 18th-century edition of Ephraim's works in both Syriac and Greek, it is only in the last half-century that reliable editions of the Syriac texts have appeared.

Ephraim lived in a milieu that was probably largely bilingual, though he himself belongs primarily to the Syriac cultural world and it is uncertain whether he read Greek; nevertheless he has some awareness of the Greek cultural world: in his prose works Plato, the Stoics, Hermes (Trismegistus), and Albinus all receive mention, while in his poetry he alludes to Greek mythology on at least two occasions.

Ephraim's fame was already known to Jerome, who devotes a chapter on him in his *On Famous Men* (written in 392), and notices on him subsequently feature in a number of Greek 5th-century works, notably in Palladius' *Lausiac History* (chapter 40) and in the *Ecclesiastical Histories* by Sozomen (3. 16) and Theodoret (4. 29); Sozomen accords him the highest praise, describing him as "the greatest ornament of the Catholic Church", and as someone who "comprehended with ease the most abstruse theorems of philosophy", and whose "style of writing was so filled with splendid oratory ... that he surpassed the most approved writers of Greece". The Syriac *Life* of Ephraim, of which a Greek adaptation also survives, can hardly date before the mid-6th century, and it simply expands upon material to be found in the earlier Greek sources. The *Life* further contains the famous episode of the saint's visit to St Basil in Caesarea, which features in the Greek encomium on St Basil falsely attributed to St Ephraim himself, pseudo-Amphilochius' *Life* of St Basil, and pseudo-Gregory of Nyssa's Encomium on St Ephraim. The seeds of this legend go back to the mistaken identification of "a Syrian", mentioned by St Basil, as Ephraim (this "Syrian" is now known to have been Eusebius of Emesa).

Less than 20 years after Ephraim's death Jerome reports that he had read a work on the Holy Spirit by Ephraim in Greek translation. Although this particular work cannot be identified for certain, more than 250 texts in Greek attributed to Ephraim do survive. Much work on sorting out the many problems connected with this large corpus, however, still remains to be done: thus attributions in the manuscripts and versions are often at variance (Macarius and John Chrysostom are quite frequent alternatives), and many works come down in multiple forms. Critical editions are absent except in a few cases, and so for the most part the 18th-century edition by J.S. Assemani remains the standard (it serves as the basis for the recent new edition by K.G. Phrantzolas). In general terms, the Greek corpus can be divided into four main categories: (1)

texts for which a Syriac original, probably by Ephraim himself, can be identified; this applies to the long verse homily on *Jonah and the Repentance of Nineveh*, where the Greek translator adopts the seven-syllable metre of the original; (2) texts for which a Syriac original exists, but is not by Ephraim: examples of this are the influential *Sermo Asceticus*, which is built up from several different Syriac sources, the *Testament of Ephraim*, and the *Life of Abraham and his niece Mary*; (3) texts in syllabic metre (suggesting a Syriac origin), for which no Syriac survives; some of these may go back to lost Syriac originals, but more often they seem to be Greek compositions; thus the homily on Abraham and Isaac uses the Septuagint text of Genesis, and the Greek homily on Elijah is quite different from the Syriac one, which is also attributed to Ephraim; (4) prose texts that were certainly written in Greek. A few of these may well belong to the 6th-century Ephraim, patriarch of Antioch, while others will belong to that large throng of unknown authors of (especially) the 5th and 6th centuries whose works came to be attributed to more famous names. The famous Lenten prayer of St Ephraim, beginning "O Lord and Master of my life", seems to belong to this category, for no trace of a Syriac original is to be found.

Of Ephraim's poetry it was only the narrative poems, in seven-syllable couplets, that were translated, and the Greek translations of these, which reproduce the syllabic metrical pattern of the originals, may well have helped to introduce into Greek this new metrical form, so different from Classical Greek metre. Although none of the lyric poems appears to have been translated, it is very possible that their poetic form may have provided some of the inspiration for the creation of the kontakion, the oldest examples of which go back to the late 5th century; the kontakion, however, introduces a new element, in the form of homotony. It is also quite possible that Romanos, a 6th-century native of bilingual Syria and the greatest exponent of the kontakion form, would have been able to read Ephraim's *madrashe* and so borrow some of his motifs.

Ephraim's discourses were often prescribed for Lenten reading in monasteries, and excerpts from them feature prominently in a number of monastic florilegia, such as the *Synagoge*, or *Evergetinos*, of Paul (d. 1054) of the monastery of the Theotokos Evergetis. Many of the Greek texts attributed to Ephraim were subsequently translated into a wide variety of other languages – Latin, Coptic, Georgian, Armenian, Arabic, Ethiopic, Christian Palestinian Aramaic, and Slavonic.

Descriptions of the Second Coming in a number of the Greek works have influenced the iconographical tradition. The earliest portrayal of St Ephraim himself is on a mid-10th century icon in St Catherine's Monastery, Sinai: the upper two panels of the icon portray the apostle Thaddaeus and king Abgar of Edessa with the Mandylion, while the lower two have St Paul and St Antony on the left, and St Basil and St Ephraim on the right. A popular theme in the post-Byzantine period is the death of St Ephraim: 16th-century examples can be found in icons in Jerusalem, Patmos, and the monastery of Iviron (Athos), and in paintings in the *katholikon* of the monastery of Docheiariou (Athos) and elsewhere. St Ephraim's liturgical commemoration is on 28 January.

SEBASTIAN BROCK

Biography

Born *c.*306 at Nisibis (modern Nusaybin) where he spent most of his life, Ephraim was ordained a deacon. After the Persians occupied Nisibis in 363, he moved to Edessa (modern Urfa) where he died in 373. His copious writings, composed in Syriac, include lyric and narrative poetry as well as exegetical, dogmatic, and ascetic prose works. Several were translated into Greek (where many more were attributed to him) and had a significant impact on the subsequent tradition.

Epicurus 341–270 BC

Philosopher

Though an Athenian by citizenship, Epicurus was born and brought up in Samos, after his father Neocles emigrated to the Athenian cleruchy there. He was educated in Athens by the Platonist Pamphilus and the Democritean Nausiphanes. After a period teaching philosophy in Mytilene and Lampsacus he returned to Athens (307/06 BC) and bought a house with a

garden (on a site between the Dipylon Gate and Plato's Academy) where he set up his own philosophical school (sometimes referred to simply as "the garden"). He created scandal by including both slaves and women in the community of followers who gathered around him.

Philosophically, Epicurus was a hedonist, in that he believed that pleasure was the goal of all activity, but his conception of pleasure was a very austere one. The supreme pleasure, he claimed, could be enjoyed only in the absence of all pain (and indeed in some sense pleasure consisted of the removal of pain, as in drinking when we are thirsty, or eating when we are hungry). Since an unfulfilled desire is a pain, then the happy life can be achieved only if we restrict our desires to those that are related to natural, satiable, appetites (e.g. for food or drink), and remove those that spring from unnatural appetites (for gourmet meals, for example, or wealth, fame, and power); such desires, being unnatural, have no natural limit, and so can never be satisfied. He recommended, then, a simple life of unambitious obscurity. To the objection that uncontrolled pain in this life, and punishment by the gods in the life to come, might overbalance any pleasure we may achieve, he responded that death was our guarantee that no pain could become so great as to overcome pleasure entirely; death limits the amount of pain we can suffer, because it is the end of all sensation: "Death is nothing to us, for when we are death is not, and when death is we are not." So far as the gods are concerned, they would not be able to live lives of perfect pleasure if they bothered themselves with the running of the world, and so, he argues, like perfect Epicureans they enjoy an existence of eternally undisturbed blessedness, taking no interest in us or our activities. He supported these positions by adopting a modified form of the atomism of Democritus, which enabled him to explain the creation and existence of the world in purely mechanical terms, as the result of random collisions of atoms, without having to bring in a divine creator. Since the human soul also consisted of atoms, which dispersed at death, there could be no afterlife, and death need no longer be feared. His principal modification of Democritus' system was the introduction of an uncaused swerve that some atoms made at random times; this seems to have been Epicurus' attempt to escape the risk that Democritus' purely mechanistic universe would rule out human free will, but the fragmentary nature of the evidence makes it difficult to be certain how he thought of this as working. He went on to develop a sophisticated theory of perception (sight, for example, being caused by thin films of atoms that are constantly being cast off by physical objects, and which are brought into contact with our soul-atoms through our eyes), and on the basis of this a theory of knowledge that rested on the absolute reliability of all sense perception (but not of our interpretation of it).

Though Epicurus was reputedly a prolific writer, very few of his works survive. Diogenes Laertius' *Lives of the Philosophers* preserves three "letters" (really short essays) on ethics, astronomy, and physics, together with a collection of 40 sayings, the *Principal Doctrines*. Another similar collection is preserved in a manuscript found in the Vatican in the 19th century. In addition, in the 18th century, scrolls of his major work, *On Nature*, were discovered preserved by volcanic ash in the Villa of the Papyri at Herculaneum; attempts to unroll and read them have been successful only recently. Otherwise we are dependent on an account in verse of his physics written by the Roman poet Lucretius, and summaries of his doctrines by writers such as Cicero and Plutarch, given from the point of view of his philosophical opponents.

Unlike many ancient philosophical schools, the Epicureans were enthusiastic proselytizers, and made an effort, with popularizing accounts of their doctrines, to make a wide appeal, and their success attracted the hostility and contempt of the followers of more conservative schools. A striking example of the degree of enthusiasm that the school could arouse in its followers is shown by a massive inscription (covering a wall about 80 m long) put up in the Lycian city of Oenoanda in the 2nd century AD by the Epicurean Diogenes for the edification of his fellow citizens, and containing among other things treatises on ethics and physics, and a collection of maxims. There is no evidence that the school survived into the 3rd century AD.

Though Epicureanism, with its emphasis on community and moderation, its enthusiasm for proselytizing, and its hostility to conventional religion and superstition, might be thought to have many points of resemblance to Christianity, Christian writers treat it on the whole unsympathetically. Although some Epicurean teachings (that the soul is a physical thing, for example, and that the world had a beginning and an end) gave welcome support to the Christian position in controversies with other philosophical schools, so that in these contexts Epicurean views could be cited with approval, Christians in general were unsympathetic to Epicureans. Their denial of a life after death, their belief that the gods did not concern themselves with what happens in the world, and their elevation of pleasure as the ultimate goal of all activity made them the representatives of all that was wrong with non-Christian thought. A very few Christian writers saw their virtues (Gregory of Nazianzus, for example, praises Epicurus for his moderation), but in general they do no more than repeat anti-Epicurean polemic picked up from the writings of rival philosophers, and played a great part in perpetuating the caricature of Epicureans as vulgar hedonists.

RICHARD WALLACE

Biography

Born in Samos in 341 BC, Epicurus was educated in Athens where he was a pupil of the Platonist Pamphilus and the atomist Nausiphanes. In 309 he began teaching and opened schools in Mytilene and Lampsacus. In 307/06 he returned to Athens and opened a school called "the garden" which continued to teach Epicureanism until the 2nd century AD. Apart from some surviving fragments his writings are best known through the *De Rerum Natura* of Lucretius. He died at Athens in 270 BC.

Epidaurus

City in the eastern Peloponnese

Epidaurus is a typical small Greek city, hardly bigger than an English village, situated on the coast at the south side of the Saronic gulf. It is important for one reason only, the existence in its southern hinterland of the remains of the ancient sanctuary of Asclepius the healing god, the most significant of his sanctuaries in mainland Greece.

Asclepius was something of a parvenu among the Greek gods. According to his mythology, he was the son of Apollo and a mortal woman Coronis; originally a mortal, he was only subsequently deified. There is no real trace of his cult in the early Greek tradition, and his sanctuary at Epidaurus was grafted on to an existing sanctuary of Apollo. At first it was completely nondescript, an altar and a small adjacent building. Apollo himself had little more, and the whole is typical of the modest sanctuaries that were sufficient for and all that could be afforded by the less wealthy Greek communities. It is thus possible to trace its deliberate conversion, the reason and means whereby this was achieved, into one of the major sanctuaries of Greece.

The cause seems to have been the great plague which struck Athens during the early years of the Peloponnesian War, when the rural population was evacuated into the area defended by the walls that linked Athens to Piraeus, in squalid conditions with no sanitation. At this time, the last third of the 5th century BC, Greek medicine was developing along scientific – certainly pragmatic – lines. It is the time of Hippocrates the "father" of Greek medicine. But parallel to this was a firm belief, certainly among the mass of the population, in miracle cures brought about by the intervention of a deity. Asclepius, through his father, was the appropriate focus for such beliefs, and duly acquired divine status. Since conventional doctors had no cure for the plague, anyone who recovered, or any community which escaped, could only credit this to the intervention of the god, and the reputation of Asclepius was thereby greatly increased. A small sanctuary (again, grafted on to one of Apollo) was established in 416 BC on the south slopes of the Acropolis at Athens; but it was Epidaurus (which seems to have escaped the spread of the plague) that benefited the most.

The sanctuary was supposedly at the place, or, rather, one of the places, where it was believed that Asclepius was born. During the 4th century BC the amount of patronage attracted

Epidaurus: view of the theatre, built in the 4th century BC to seat 14,000 and still in use today

to the sanctuary, and, by implication, the amount of revenue it raised for the cult, enabled a substantial building programme to be carried out. The contracts for the various necessary building projects were recorded by inscriptions on stone. Many of these have survived, and record the progress of the sanctuary's development, and the means by which this was achieved. The work was under the control of an official board of commissioners, who were entrusted with, or more likely actively collected, the necessary funds. They appointed roving ambassadors who visited cities up and down the Greek world asking for financial support. They let the contracts, to quarrymen, to transporters, and to craftsmen. They appointed the architect. They also appointed guarantors, wealthy citizens of Epidaurus, who would be liable to financial penalties if the work was not carried out to the satisfaction of the commissioners. These inscriptions record the cost of materials and their transport, the wages of the craftsmen, and the salary paid to the architect (he got double the rate of an ordinary workman, which suggests that his pay was regarded basically as expenses only). It is possible to calculate, when the inscriptions are well enough preserved, the actual cost of the buildings, and these make clear that figures given in later literary sources for other building projects, particularly those on the Acropolis of Athens, are grossly exaggerated.

The first essential in the building programme was the Doric temple of Asclepius, in limestone, brought mostly from Corinth, and with Pentelic marble for the sculptural decoration. In front of this was the altar, and to the north a long enclosed building, the Abaton, which was the place of healing: in this the patients slept, and during the night were supposedly visited and healed by the god. Next came the most ornate structure, a circular Doric building called the Thymele. It once had important painted wall decoration, described by Pausanias but now irretrievably lost. The circular cella had a decorative interior colonnade of Corinthian columns. (There were probably Corinthian columns also in the temple but these have totally vanished.) It all rested on a maze of circular foundations, each ring accessible to the next through doorways. Its purpose is enigmatic, but it is probably best interpreted as a cenotaph, representing the burial place of the human Asclepius before he was deified. The inscriptions for this building cover a period of over 30 years, in the second half of the 4th century BC, a time when, it is clear, funds were coming in erratically. Another important building of this period is the great theatre, the best preserved in mainland Greece, attributed by Pausanias, together with the Thymele, to Polyclitus, who he seems to have thought was the famous Argive sculptor. But the dates are wrong, and unless this is a total mistake, the architect was probably a descendant of the sculptor.

Construction work continued well into the 3rd century BC, buildings often being paid for by single donors. They include a large courtyard building, with an elaborate ramped entrance for processions, and surrounded by rooms equipped for ritual feasting in the Greek manner, the participants in the sacred meals reclining on simple couches. There is a propylon, or gateway building, not an effective barrier, since it can be bypassed to either side. Its function is to mark the entry into the sanctuary; there was a rule that all the sacrificial meat had to be consumed within the boundary. There was quite elaborate provision for water supplies; the abundance of water, still a feature of the site, is undoubtedly the reason the sanctuary developed at this particular spot. There is a stadium for athletic contests. There are also temples and altars to other deities, to Apollo's sister Artemis, and to other gods whose identity is not recorded.

The sanctuary flourished throughout the Hellenistic period, when many of the cures effected were recorded on inscriptions ("publication promised"). It was ransacked in the disturbed times of the 1st century BC, but revived and flourished again under the Romans, when buildings were repaired and a bath building added. The last recorded cures date to the 4th century AD, but the whole cult, its beliefs and practices, had such close parallels to Christianity (which was certainly influenced by this and similar cults) that it was regarded as a blasphemy, and ceased to function. The buildings fell into ruin, except for the theatre the seats of which were covered by earth slips. In the late 19th century the theatre was excavated and now plays an important role in the continuity of the Hellenic tradition, as a venue for the modern production of classical Athenian drama.

R.A. TOMLINSON

Summary

City in the eastern Peloponnese, Epidaurus is best known at the principal sanctuary of Asclepius in mainland Greece. The cult, associated with the birthplace of the god, seems to have originated at the time of the plague in Athens (430 BC). Most of the surviving buildings, including a well-preserved theatre, date from the 4th century BC.

Epigram

Originally an epigram (from the verb *epigrapho* – "I write upon") was an inscription on an object or a monument. Its original application determined the characteristic features of what was to become a literary genre; it was brief and in verse, while its content was usually dedicatory or funereal. The literary genre of the epigram in its non-inscriptional form was developed and cultivated intensively in the Hellenistic and imperial periods. The epigram is perhaps the sole ancient literary genre that has been practised unremittingly down to modern times. Although the genre underwent considerable changes in the Byzantine period, the basic characteristics remained the same, while its original association with inscriptions was not entirely lost.

Archaic epigrams are inscriptions. The earliest known (8th century BC) are in hexameters but very soon the predominant metre became the elegiac couplet which was to become the classic metre of the epigram. The epigrams of the Archaic

period are mostly epitaphs or inscriptions on an object, and they consist largely of formulas.

Many inscriptional epigrams from the Classical period are anonymous. The first known epigrammatist was Simonides of Ceos (557/56–468 BC) who wrote funeral epigrams on the fallen in the Persian Wars. Yet only a few of the epigrams attributed to him are certainly his. Some renowned figures such as Aeschylus, Euripides, Plato, and Aristotle also composed epigrams which now became increasingly elaborate in form and content. Their aim is often to edify, but human feelings are also given expression.

The beginning of the Hellenistic age marks a turning point in the history of the epigram. Two important changes raised it into a literary genre: it became less factual as it gradually lost its association with actual events and objects, and thus served no practical function; and it was published mainly in book form. The epigram now became a vehicle for the expression of personal feelings, assuming the role traditionally played by lyric and sympotic poetry. Allusiveness, conciseness, density of expression, wit, and a constant search for variation now became characteristics of the genre. Two schools of early epigrammatists may be distinguished: the Dorian-Peloponnesian and the Ionian-Alexandrian. In the first the leading figure was Leonidas of Tarentum, as well as the female poets Anyte, Nossis, and Moiro. They show a preference for the traditional inscriptional epigram, i.e. dedicatory and funereal. The ordinary and idyllic replace the heroic aspect, but the style is often ornate or even pompous. Callimachus, Poseidippus, and Asclepiades are eminent figures of the Ionian-Alexandrian school. Witty language and the art of allusion are skilfully used to describe the pleasures of life, wine, love, song, women, boys. In the 1st century BC the epigram blossomed with Antipater of Sidon and Meleager of Gadara (Phoenician school). The latter compiled the first anthology of epigrams known as "Garland" (*Stephanos*). It became a characteristic of the literary epigram to appear in anthologies. The most important were the *Garland* of Philip (*c.*AD 40), the *Cycle* of Agathias (6th century AD), and later the *Palatine Anthology* (*c.*980) and the *Planudean Anthology* (1301).

The epigram flourished in the imperial age and was taken over by Roman poets. There is a noticeable change not only in the themes of epigrams but also in their tone. Ecphrastic and epideictic epigrams for various occasions – epigrams on events of everyday life, to accompany gifts, to console or to congratulate, to thank or invite now predominate – and satirical epigrams also became very fashionable. Many Greek epigrammatists, such as Philodemus, Crinagoras, and Antipater of Thessalonica, frequented Roman high society. In the 2nd century AD the epigram went through a classicizing phase; and the erotic epigram was revived with Rufinus and Strato, who wrote pederastic ones.

The epigram was cultivated widely during the Byzantine millennium. In the first two centuries of the empire epigrams were still written in Classical metres, in an archaizing language and on Classical themes. This manner of epigrammatic poetry was to be fashionable again in the last two centuries of the empire, when nostalgia for the Classical past revived classizing tendencies. Yet relatively few Byzantine epigrams are written in the ancient metres: the Greek language had long since lost its ancient prosodic features and was now based on stress. The most fashionable metre was the iambic in 12 syllables (with the penultimate stressed) and later in 15 syllables ("political verse"). The Byzantines also developed the sacred epigram, i.e. the epigram on Christian themes (icons, saints, Church festivals), although dedicatory or satirical epigrams were also popular.

In the 4th century the literary epigram enjoyed a revival in the hands of a pagan and a Christian poet, Palladas and Gregory of Nazianzus. Palladas wrote a number of satirical epigrams as well as laments for the decline of paganism. The profane epigram was cultivated with remarkable success up to the 6th century by such skilled poets as Agathias and Paul Silentiarius who, though Christians, followed the model of the Hellenistic epigram. George of Pisidia (7th century) did much to establish the sacred epigram and became a model for future generations. The most important period for the Byzantine sacred epigram came with the end of iconoclasm (843). At this time the Byzantine epigram began to detach itself from classicizing models and to form its own distinct characteristics. Theodore of Stoudios (d. 826) channelled his theological views into epigrams, aiming both to instruct and to edify. In the 10th century the popularity of the epigram combined with the revival of interest in Classical antiquity led to the compilation of anthologies. Constantinos Kephalas compiled a substantial anthology (now lost) that served as the basis for the *Palatine Anthology*; the latter contains 3,700 epigrams from the 6th century BC to the 10th century AD arranged in 15 books. (A shorter anthology was compiled in 1301 by Maximos Planudes). The genre continued to be practised on a wide range of topics in the following centuries and reached its golden age with poets such as John Geometres (10th century), John Mavropous, Christophoros Mytilenaios (11th century), and Theodore Prodromos (12th century). In the last two centuries the number of epigrams in Classical metres increased, while the epigram in Byzantine metres declined in the hands of Manuel Philis (14th century).

The revival of Classical learning during the Italian Renaissance is clearly reflected in the flourishing of classicizing epigrams in ancient metres and archaizing language. The genre was first practised by Greek émigré scholars such as Janus Laskaris, the first editor of the *Planudean Anthology* (1494), but soon it became very fashionable among western humanists who gave an enthusiastic reception to the *Planudean Anthology* (the *Palatine Anthology* – Vatican Library cod. Palatinus Gr. 23 – remained unknown until 1607). Yet this was more a scholarly than a poetic enterprise. Epigrams of this kind were *pièces d'occasion*, mostly dedicatory or complimentary, usually placed in the prefaces of books rather than separately published. Poliziano (1454–94) was one of the first western humanists to write such epigrams. In the 17th century polymaths such as J. Auratus, J.J. Scaliger, I. Causabon, and M. Crusius were prolific practitioners of the genre, also cultivating the bilingual epigram (i.e. in Greek and Latin). Notable Greek scholars who wrote classicizing epigrams were M. Mousouros, E. Portos, M. Margounios, and J. Kottounios.

Epigram is a rather ambiguous term in modern European literature since it lacks distinct formal characteristics; short, witty poems often qualify as such. Yet it is difficult to talk about a clearly distinct genre of epigram in modern Greek literature. Short poems with or without rhyme striving for point

were composed by many poets. The poems of Christopoulos (1772–1847) and Valaoritis (1824–79) could be regarded as epigrams, and also the work of poets of the generation of 1880 (Drosinis, Vizyinos, Polemis, and Pallis).

Epiphanius of Salamis, St

Theologian of the 4th century

Epiphanius occupies a prominent place among the Church Fathers of the 4th century because of his theological writings. He is also considered an important saint of the Church in Cyprus, where he lived for nearly four decades as a miracle-working bishop.

His biography, which has to be patched together from different sources, can be traced as follows. He was born sometime between 310 and 320 near Eleutheropolis in Palestine. That his family were Jews is affirmed by the *Life of Epiphanius*, composed in the 5th century, and later repeated by Byzantine theologians such as the patriarch Nikephoros (808–15). Orphaned at a very young age, he was taken into the household of a rabbi who provided him with a traditional religious education. Soon after the rabbi's death, Epiphanius converted to Christianity under the impression of a divine vision. He travelled to Egypt where he became acquainted with the monastic life of the Desert Fathers and on his return to Palestine founded a monastery in the vicinity of his birthplace.

In 367, while visiting the island of Cyprus, he was ordained bishop of the see of Constantia (ancient Salamis, modern Famagusta), which had recently fallen vacant. Under Epiphanius' energetic guidance, Christianity established a firm hold among the largely pagan population of this wealthy and thriving port. In order to accommodate the growing number of Christians, he initiated the construction of a large five-aisled basilica – today in ruins – which eventually became the resting place of his relics.

Epiphanius played an active role as a defender of orthodoxy in the theological controversies of his time. In the Meletian schism that afflicted the Church of Antioch, Epiphanius lent his support to bishop Paulinus, on whose behalf he went to Antioch, lobbied at the Second Ecumenical Council in 381 in Constantinople, and even travelled to Rome in 382. His disapproval of the teachings of Origen prompted him to take a stand against John, patriarch of Jerusalem, who was known as an Origenist sympathizer. As the crowds were gathered for the feast of Encaenia in Jerusalem in 383, Epiphanius and John each delivered a sermon attacking the other. In the following year the rift between them deepened when Epiphanius ordained to the priesthood Paulinian, the younger brother of Jerome, within the jurisdiction, but without the explicit permission, of the patriarch.

Epiphanius had also offended the patriarch John on an earlier visit to Palestine, as they were both passing through the village of Anablatha. When he noticed in the church a curtain with the representation of a human image, either of Christ or of a saint, he immediately tore it down, declaring that it would be fit only for a burial cloth. John was offended at this rash gesture at first, but later mollified by Epiphanius' promise to replace the curtain at his own expense. This episode, first attested in Letter 51 of Jerome, was exploited more than four centuries later, for the first time in 815, in the iconoclast controversy when the iconoclasts adduced it in support of their anti-iconic stance. Although the iconophiles, such as John of Damascus, the patriarch Nikephoros, and Theodore the Stoudite, attempted to question the authenticity of this story,

they were nonetheless eager to admit that "we recognize the holy father as a teacher of the universal Church".

The third and last involvement of Epiphanius in large-scale ecclesiastical politics was again prompted by his fervour for orthodoxy. John Chrysostom, the patriarch of Constantinople, had fallen under suspicion of harbouring Origenist sympathies. Spearheading the international coalition that was forming against him and that would eventually bring about his deposition and exile was Theophilus, the patriarch of Alexandria, who urged Epiphanius to become involved. Epiphanius first obtained the condemnation of Origen's teachings from a synod in Cyprus, and then, despite his advanced age, travelled to Constantinople where he made contact with the enemies of John, while refusing the patriarch's hospitality. He was on his way to deliver a public sermon against John when the latter alerted him to the imminent danger of riots in the capital. Thereupon, Epiphanius departed in great haste. He died aboard the ship that was carrying him to Cyprus, in the spring of 403, and was buried with great honours in the basilica of Constantia/Salamis. His feast day is 12 May.

Within two generations of his death, a saint's *Life* was composed in his honour, based in part on the eyewitness account of his disciples John and Polybius. It was translated into Coptic, Syriac, Georgian, and Latin, thus attesting to his fame throughout Christendom. The first translation of the *Life of Epiphanius* into modern Greek was the work of Kaisarios Dapontes, a monk on Mount Athos, in 1780.

Many miracles were attested at Epiphanius' tomb before the mid-7th century when Cyprus was invaded by the Arabs. The emperor Leo VI (886–912) eventually arranged for the transportation of his relics to Constantinople, but their subsequent history is unknown. Next to the apostle Barnabas, who was martyred by the Jews of Salamis, Epiphanius is the most prominent saint of Cyprus and is frequently depicted, dressed as a bishop, in local church decoration. His able and energetic administration of the episcopate not only helped to establish the city of Constantia as the location of the metropolitan see of the island, it also provided a forceful precedent when the autocephaly of the Church of Cyprus from the patriarchate of Antioch was debated and affirmed at the Council of Ephesus in 431.

Epiphanius' reputation as a Church Father rests upon his prolific literary production. He wrote several smaller treatises (*On Gems*, *On Weights and Measures*, *Catalogue of the Apostles*) that enjoyed enormous popularity even beyond the Byzantine empire. His most original works are the *Ancoratus* and the *Panarion*. The *Ancoratus* was completed in 374, seven years after his accession to the episcopate. Epiphanius had composed it at the request of the Church of Syedra in Pamphylia as an "anchor" (hence the title) of faith in the adverse winds of heresy. It gives a systematic treatment of Christian dogma. In some manuscripts it contains the earliest version of the Nicaeno-Constantinopolitan Creed. A few years later he published the *Panarion*. This work was intended as a "medicine chest" (the literal meaning of the title) against various heresies. Epiphanius deals with 80 heresies, comparing them to poisonous animals, expounding their teaching in some detail, then providing the antidote by refuting their doctrines and denouncing their religous practices. In gathering his material, he spared no effort to obtain relevant and reliable information. This, combined with the fact that he is the only author to discuss many of them in detail, makes the *Panarion* a very significant source of information about dissenting groups within the early Church.

It was Epiphanius' ardent defence of orthodoxy, in his writing as well as in his life, that attracted the attention of Catholic scholars of the Counter-Reformation. The first edition of his works was published, in Latin, in Basel in 1571. At around the same time cardinal Sirlet, the cardinal librarian of the Vatican Library who had also attended the Council of Trent, showed his interest in Epiphanius when he noted down, in his own hand, excerpts from his saint's *Life*. Finally, it was a Jesuit scholar in Paris, Denis Petau, who produced the first edition in Greek of the *Ancoratus* and the *Panarion* in 1622, highlighting in his preface the importance of Epiphanius' work for the present struggle against the Protestants.

CLAUDIA RAPP

Biography

Born at Eleutheropolis in Palestine in the second decade of the 4th century to a Jewish family, Epiphanius was educated by a rabbi, but converted to Christianity soon after the rabbi's death. He spent some time in Egypt with the desert fathers and returned to Palestine where he founded a monastery *c.*335. In 367 he became bishop of Salamis on Cyprus, defending orthodoxy in his teaching and his writing until his death in 403.

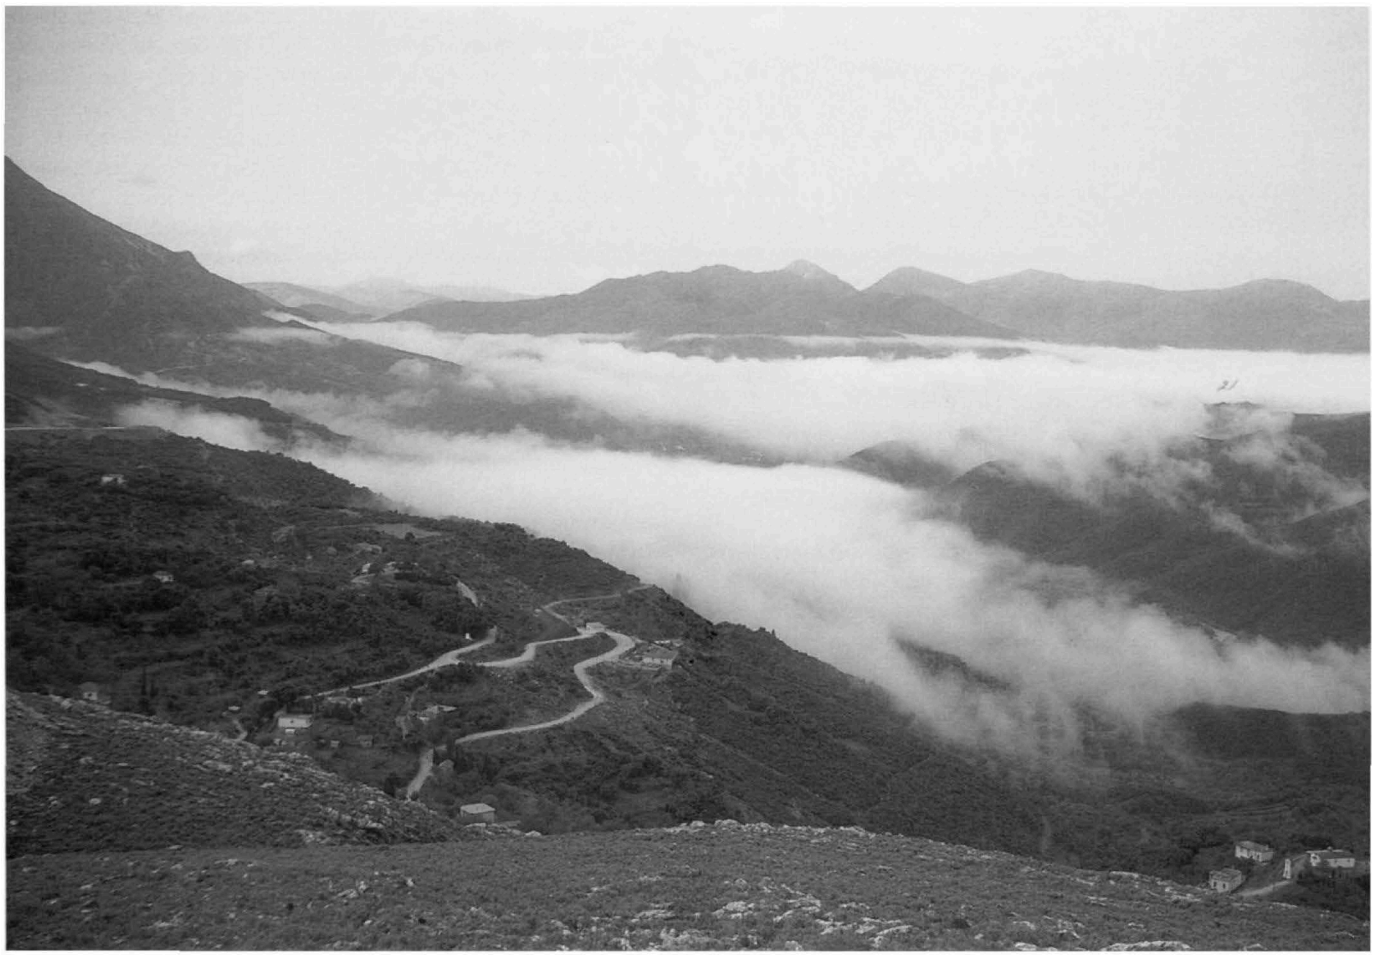
Epirus

Region in northwest Greece

Epeiros means "mainland" in ancient Greek. At first sight this seems rather a vague term, but the western coast of Epirus is the mainland opposite the northern Ionian islands of Corfu and its outliers. The eastern border is formed by the central Pindus massif running like a spine through northern Greece. To the north, the central Albanian plain beginning near Vlorë marks the end of Epirus, basically a mountainous region, while to the south the Gulf of Arta and the comparatively low-lying areas of Aetolia and Acarnania form a similar barrier. Three



Epirus: "Dark Suli's rocks ... robed half in mist" – the mountains between Ioannina and the sea

parallel high limestone ridges running from north to south dominate the landscape and make the area curiously enclosed, since invaders coming from the north can climb up the valleys of the Aoos (Vijosë) river and its tributaries, but eventually these lead nowhere. The alluvial valleys are quite fertile, but flooding is always a danger. There are few natural harbours, and these are liable to silting. Rainfall by Greek standards is plentiful, although winters are harsh, and melting snows cause deforestation.

Unlike Macedonia, Epirus is a compact, well-defined, and reasonably homogeneous entity, but both areas have caused controversy by their position half inside and half outside the Greek world. Thus in Classical times Epirots and Macedonians were seen as semibarbarians, and, whereas the territory of Classical Greece was independent in 1830, it was not until the Balkan Wars of 1912 and 1913 that Epirus, like Macedonia, was freed from the Ottoman yoke. In the early Middle Ages most of Epirus passed from Byzantine control, and for much of the later Middle Ages it was ruled by a Greek-speaking dynasty, but one different from that reigning in Constantinople. At all times the ethnicity of Epirus has been in dispute, with Greeks and Illyrians in ancient times, Greeks, Albanians, and a few other races in modern times, sharing the territory between them. At present Greeks still call southern Albania "northern Epirus", and it is possible to find Greek-speakers as far north as Vlorë. Up until World War II it was still possible to find Albanian-speakers as far south as Preveza. The history of Epirus in ancient and medieval times is distorted by the wish to prove the antiquity of Greek or Albanian claims, although most of the evidence points to considerable movements of population, the infiltration of other ethnic groups, notably Slavs, Turks, and Latins, and a generally mixed population.

The *Odyssey* refers to Epirus as the mainland and to the possibility that Odysseus may have sheltered in Thesprotia, the area opposite Corfu which is still known by this name. Homer in the same poem talks of the oracle of Dodona, second only to Delphi in fame and to none in antiquity, situated in the mountains of eastern Epirus. Herodotus mentions Epirus as the home of the ancient Dorians and refers to the oracle at the mouth of the river Acheron in southern Epirus. The Persian and Peloponnesian Wars do not seem to have impinged much on Epirus, although the Persian invasion to the east, the conflict between Corcyra (modern Corfu) and Epidamnus to the west, and the campaigns of Demosthenes in Aetolia to the south must have made some mark.

In the 4th century BC the Greek world widened. Philip of Macedon was married to the sister of Alexander, a powerful king of the Molossians, who seems to have established hegemony over the rest of Epirus. He and his more famous cousin Pyrrhus tried to expand westwards in the same way that Alexander the Great had expanded the power of Macedon to

the east, but both perished in the attempt. Nevertheless, the 3rd and 2nd centuries were prosperous times for Epirus in which powerful cities like Antigoneia and Amantia were built. Modern Albanian historians tend to see these as Illyrian foundations, but 4th-century inscriptions show the tribes of Epirus, including the Molossians, writing in Greek. The Molossian monarchy fell in 232 BC and was replaced by a federal republic with an assembly at Phoenice (modern Finiq) in the Greek-speaking part of southern Albania. In Rome's war against Macedon, Epirus changed sides and was punished for its faithlessness by the Roman sack of many Epirote towns and the enslavement of 150,000 captives in 168 BC.

Not surprisingly, Epirus fell into decline under Roman rule. Cicero's friend Atticus had rich estates at Buthrotum (modern Butrint) and Latin settlers and traders may have brought some prosperity to the coast near Italy, although both branches of the Via Egnatia passed further north. Augustus founded Nicopolis near Preveza and Hadrian Hadrianopolis near Gjirokastër. Roman foundations in Greek lands soon lost their Latin speech, but the influence of Latin should not be discounted as a factor in west Balkan ethnology, as it would help explain both the presence of large numbers of Vlachs in Albanian and Greek Epirus and the survival of Albanian, not giving way to Greek or Latin because neither was the dominant lingua franca.

Writing in the 1st century AD, Strabo gives a picture not only of Epirus in his own day, but also, apparently drawing on the 6th-century BC geographer Hecataeus, of conditions in the past. Tribes like the Chaones and the Molossians had long vanished by Strabo's time, but interestingly he describes them as neither Illyrian nor Greek, but Epirot. The ambiguous state of Epirus did not become any clearer when Roman authority collapsed. Alaric and his Visigoths occupied Epirus for quite a long period at the beginning of the 5th century before proceeding westwards. The revival of the east Roman empire in the 6th century under Justinian I, himself of Illyrian stock, temporarily revived the fortunes of Epirus, now divided into Vetus Epirus in the south and Nova Epirus in the north. According to the 6th-century historian Procopius, Justinian built or rebuilt extensive fortifications in both districts. Some of them may have been the work of Anastasius. But the fortifications proved useless in checking the Slav invasions which had already begun at the end of Justinian's reign. At the beginning of the 7th century Byzantine authority over the whole of the western Balkans would seem to have been lost. The extent and nature of the Slav invasions are a matter of dispute, particularly among Greek and Albanian historians who in minimizing the Slav presence point to the undoubted survival of the Greek and Albanian languages. On the other hand, the melancholy testimony of the few written records, the abundance of Slav placenames in Epirus, and the archaeological evidence with almost no churches being built between the 6th and 9th centuries, do suggest a hiatus in the Greek presence.

By the 9th century Byzantium was recovering. It still occupied southern Italy, and had a strong navy. Themes of Nicopolis and Dyrrhachium were established in southern and northern Epirus, although it is uncertain how far these themes extended inland. When in 1016 Basil II defeated the Bulgarians he recaptured the whole of the Balkans, and Epirus remained in the Byzantine empire for most of the next two centuries. The last Italian possession of the empire fell to the Normans in 1071, and towards the end of the 11th century Epirus was frequently invaded from the west by leaders like Robert Guiscard and his son Bohemond.

Manuel Komnenos was the last Byzantine emperor to harbour Italian ambitions and to control the western Balkans. Shortly after his death, the Serbs under Stefan Nemanja became independent, the Bulgars revolted, and the Albanian tribes of the interior, never exactly subservient, followed suit. The Fourth Crusade of 1204 divided what was left of the empire with Epirus falling into the hands of the famous Doukas family, also known as Angelos, related to the Komnenoi. For the next century the fortunes of this family and of Epirus waxed and waned. Sometimes, as when they occupied Thessaly and even Thessalonica, it looked as if they might succeed in recapturing Constantinople. After the Battle of Pelagonia in 1259 it was clear that the empire of Nicaea was the stronger and the last years of the despotate of Epirus were sad ones with the dynasty being propped up by the Angevins and the succession passing through the female line to the Italian family of Orsini.

The capital of the despotate was at Arta. In spite, or perhaps because, of its precarious political position Epirus saw much church building in the 13th and 14th centuries. In southern Albania, the great fortress church of Mesopotam is a 12th-century foundation. The last despot of Epirus was defeated in 1340, and momentarily Epirus passed into the hands of the incompetent Byzantine emperor Andronikos III. He built, or restored, churches in Epirus, but within a few years the province had been lost to the Serbs under Stephan Dushan. On Dushan's death in 1355 his empire fell apart, and Epirus was ruled in part or as a whole by a succession of different nationalities, Florentine, Albanian, and Serb. It was clear that with the collapse of any central authority Epirus was an easy prey to invasions from the north of Albanians and Vlachs, both of whom have left their mark in the modern era. The anonymous *Chronicle of Ioannina* gives a good account of the complicated history of these times.

Eventually the Ottomans, with surprising speed, conquered virtually the whole of Epirus. Although Venice held isolated outposts on the coast, and Scanderbeg kept up resistance in Albania during the 15th century, most of the land was Turkish for over 500 years. It was, however, not a time of complete stagnation. The presence of Venice and the proximity to Italy meant some degree of trade and cultural interchange with the west. As a backward province remote from the capital, Epirus was not liable to much Turkish immigration, although Ioannina began to look like a Turkish town. When the central authority grew weak, warlords like Ali Pasha could carve out virtually independent realms of their own. But, although Ali Pasha and his savage bands of Albanians destroyed some villages, his rule over a mixed Greek and Albanian domain stretching from Tepelenë to Preveza was not entirely harsh. The poverty of mountain districts drove many Epirots overseas, where engaged in trade they became rich, sending part of their wealth back to their native villages. The district was wild and uncivilized, and western travellers were baffled by the medley of different races and the presence of brigands or klephts, who sometimes combined their role with that of *armatoloi* or keepers of law and order.

With the death of Ali Pasha in 1821 and the establishment of Greek independence in 1830, Epirus became even more lawless. As in Macedonia, there was a series of gallant but not always scrupulous Greek heroes fighting for liberty with the advantage that there were no rival Slav bands. Albanians and Vlachs, though present in large numbers, were less nationalistically inclined, with most Vlachs being on the Greek side. Before meeting a martyr's death in 1779, the heroic St Kosmas had travelled the length and breadth of Epirus preaching Greek nationalism and founding new churches.

Turks and Albanians in Epirus put up a stiff resistance in the First Balkan War, and Ioannina was one of the last places to fall to Greek troops. The Great Powers found it hard to draw the Greek– Albanian frontier which eventually left many Greek speakers in Albania and Albanian speakers in Greece. Before, during, and after World War I Greece briefly occupied southern Albania or northern Epirus, as the Greeks liked to call it. After the peace treaties there was a bad feeling between the two countries with violent incidents and a great deal of lawlessness on both sides of the frontier. The educational rights of Greeks in Albania were curtailed; there were no Albanian schools in Greece. Italy first fomented trouble, and then in World War II invaded Greece in 1940, only to have its forces thrown back as far as Tepelenë. The German invasion of 1941 left the Greek army stranded on this advanced line.

During World War II both Greek and Albanian Epirus saw a different pattern of resistance from that followed by the rest of Greece and Albania. In Greece the forces of EDES (*Ethnikos Dimokratikos Ellinikos Syndesmos*, the National Democratic Hellenic Union) under Napoleon Zervas were able with difficulty to keep themselves free from the control of the communist ELAS (*Ellinikos Laikos Apeleftherotikos Stratos*, the Greek Popular Liberation Army). The Greeks in Albania tried to organize resistance in broad agreement with Zervas, but found it difficult to resist the nationalist, Muslim, and vaguely pro-Axis Balli Kombëtar or the equally nationalist, atheist, but fervently anti-Axis partisans under Enver Hoxha. Hoxha, an inhabitant of the northern Epirot town of Gjirokastër, prevailed. Under his authoritarian regime the Greek minority was allowed limited educational rights, but no contact with their fellow Greek-speakers in southern Epirus. In Greece Albanian-speaking Muslims, the so-called Tsams, were accused of favouring the Axis and expelled to Albania where Hoxha planted them in such a way that the Greek element in the population was diluted.

After the war Greek Epirus, though a mountainous area difficult of access without anything much apart from Dodona in the way of Classical sites, shared the benefits brought by tourism: Igoumenitsa became an international port and resorts like Parga were made more accessible. The collapse of communism in Albania in 1992 could have led to the equally beautiful coastline of Greek-speaking Albania being developed, perhaps in a more sensitive way, but in fact there was massive emigration from Albania to Greece. Consequently, the Greek villages of northern Epirus are now sadly neglected and suffering from the general lawlessness that followed the collapse of president Berisha's government in 1997. Greece has now formally renounced its claim to northern Epirus, and showed remarkable restraint when some Albanian Greeks were found guilty of plotting against the state, but is naturally interested in the future of what, with some reason, it regards as part of its people.

T.J. WINNIFRITH

Summary

A mountainous region of northwest Greece, Epirus—like Macedonia—has always been ambivalent about its membership of the Greek world. There were ancient oracles at Dodona and Ephyra. The reign of king Pyrrhus (319–272 BC) initiated a period of prosperity for Epirus which ended with the arrival of the Romans in 168 BC. Huns and Slavs interrupted periods of Roman/Byzantine rule. After 1204 Epirus became an independent despotate but from 1340 ownership was disputed between Florentines, Albanians, and Serbs until the Ottoman conquest in the 15th century. Epirus became Greek again in 1913 but the border with Albania has remained a running sore.

Epistolography

Epistolography (from Greek *epistole* "letter" and *graphia* "writing") is letter writing. The term is used for a literary genre in which works are written in the form of letters. Such letters are known as literary letters – as distinguished from private and official letters – if they were either primarily destined for publication by their author or if they were published posthumously for the sake of their contents and what they reveal about the personality of the author (or of the addressee). A sharp line, however, cannot be drawn between literary and private letters. Private letters published afterwards should be assigned to epistolography if they are autobiographical and contemporary documents. In this case they are called literary private letters.

In Classical times folding wooden boards were used for correspondence. They were covered inside with wax to be written on and were used for answering letters after the initial message had been erased. Papyrus was also used – demon-

strated by the large number of private letters written on papyrus – and, later on, parchment and paper. Since there was no public mail service, letters were sent by messengers who had to be privately hired in each case; another possibility was to send letters with travellers.

Letter writing is not a Greek invention: in the 2nd millennium BC the Egyptians were already collecting correspondence. A theory of letter writing was gradually developed by the Greeks during the Classical period around the 5th century BC, at a time when the contents and functions of literary forms were the subject of analysis. Moreover, the art of rhetoric became increasingly important. Since epistolography was regarded as an aspect of rhetoric, basic rules and principles for writing letters were developed. Some of the thoughts and general considerations about style of one of the oldest theoreticians, Artemon of Cassandreia (1st century AD), were indirectly passed on to us through statements of a late Hellenistic author, pseudo-Demetrius (*c.*1st century AD). In the 2nd century AD a certain Philostratus established a system of rules that classified the most important items for a cultivated and refined style. Here readers learn that a letter should be an image of the writer's soul. Letters are considered to be identical in character to conversation, hence great value is attached to forms of salutation and direct address in the text. The style should be distinguished by brevity and clarity; the language should be elevated but understandable. All this can be achieved by a moderate use of Atticisms and by avoiding rarely used words. Rhetorical ornamentation is allowed in principle but should be used with moderation. Metaphors, for instance, should be avoided, but the insertion of narratives and myths, literary allusions, quotations, and proverbs is encouraged.

In later centuries these theoretical principles were taken up and described repeatedly, but observed less and less in practice. Practical examples accompanied theoretical considerations. Pseudo-Demetrius, for instance, gives a survey of different letter forms (he mentions 21), quoting a sample letter for each type. In the Renaissance this author was still in demand in the Latin west, as revealed by occasional references to him by the famous humanist Erasmus of Rotterdam in his guide to letter writing.

Literary letters appear in various forms, and theoreticians who have tried to classify them strongly disagree over their number. Both the didactic epistle, which is often used in philosophical discussions, and the dedicatory epistle, used as a preface to literary works addressed to a specific person, are found, for example. Faked letters, which first became popular during the Hellenistic period and which were sometimes compiled as epistolary novels, were used for rhetorical exercises. In addition, there are private letters concerning friendship, comfort, requests, thanks, recommendation, praise, and reproach.

When writing a letter, certain conventions had to be observed. Letters usually consisted of three parts: the introduction or *praescriptum*, the actual text, and the final clause. The *praescriptum* originally contained only the salutation of the addressee, according to the scheme "A greets B", but this could be extended to a greater demonstration of friendship in the introductory and final parts, especially if the addressee's health became the main topic.

More or less private collections of correspondence are known for almost all famous people (though many only through references in other works), beginning with the Classical authors. In the Hellenistic period the writing of letters increased and gradually gained in importance over the following centuries. The extensive correspondence of the rhetorician Libanius (4th century AD) contains more than 1500 letters written to or by Libanius, some of them addressed to famous contemporaries. It is important to note that collections of private letters not only contain letters received by the respective addressee, but also letters written by him. When a letter was composed it was usual – especially with regard to later publication of the correspondence – to make a duplicate and retain it in a private archive. Before publication letters were sometimes subjected to a second rhetorical and stylistic revision. A letter was not only an instrument of communication, but a real literary product. A letter that was carefully drafted according to the rules of rhetoric was, naturally enough, enthusiastically received by the addressee. Many inspired passages were almost literally reproduced in subsequent letters of the recipient's own; this was not regarded as reprehensible but, on the contrary, as desirable. It was called *mimesis*, imitation. Moreover, it was customary to read elaborate letters aloud to interested circles in order to enjoy collectively a writer's language and expression.

Epistolography was also influenced by Christianization. The epistles of the apostle Paul to early Christian communities, for instance, had a partially didactic, partially encouraging purpose; they stand at the beginning of the tradition of the pastoral epistles and encyclica of the Christian Church. The letter was also an important instrument for the Fathers of the Church in the discussion of dogmatic, exegetical, and philosophical problems. Christian influence is evidenced by stereotyped phrases, modesty demanding that the sender – independent of his social position – assume an attitude of humility and place himself on a lower level in relation to the addressee. The form of salutation here is: "it is B that A greets" or "B is greeted by A".

In the Byzantine period epistolography remained within the tradition of the Classical and late-Classical as well as early-Christian periods. The Byzantines took particular delight in this literary genre. Almost every well-known personality in public life – writers (e.g. Michael Psellos, Maximos Planudes), emperors (e.g. Theodoros II Laskaris, Manuel II Palaiologos), clerical dignitaries (e.g. the patriarchs Photios and Nikolaos Mystikos) – left a collection of letters. There is no real Byzantine theoretical treatise before the 14th century, when Joseph Rhakendytes devoted one chapter of his rhetorical manual to letters, taking up the instructions on style known from antiquity. However, there was a large gap between theory and practice in Byzantine times. The inherited theoretical requirements were familiar but rarely taken into account. The epistle as a literary work was composed according to the principles of rhetoric and *mimesis*, because a written work would be accepted (which means that it would be copied and passed on to other readers) only if it contained an abundance of ornamentation with rhetorical figures and hidden allusions to Classical authors. On the other hand, the elaborate style and linguistic profuseness that often appear mannered led to a strong deconcretization (that is, lack of a concrete topic). As a

result, the external form became more important than the content. Modern readers undeniably find this exaggerated or even repulsive. But for Byzantine intellectuals – and these were precisely the people to whom literary letters were directed – it became a social game: they enjoyed decoding a letter, that is, identifying Classical quotations and allusions and discovering rhetorical figures. Reading out a letter in front of an interested and competent audience could become a real performance (Greek *theatron*). If the listeners applauded the work, the writer's reputation and fame were enhanced. Byzantine epistolographers – like their Classical predecessors – collected duplicates of their letters so that they could rework them for possible publication. Such revised correspondence in turn was well received by other writers, who used it as a model or copied whole parts of it. The preface (*prooimion*) of a letter, being the rhetorically relevant part, was the most popular. The subjects of the letters were also modelled on Classical examples, and it has to be said that epistolographers insisted more on matters of style than on thematic variation. Because letters also had a social function, such topics as friendship and, in relation to this, the separation of penfriends, were prominent. A letter was then meant to provide comfort and encouragement, which although not replacing a personal meeting, was at least regarded as a certain makeshift. If requests were related to the writer himself, they sometimes articulated specific material wishes. This often led to begging letters of which there are numerous unpleasant examples from the Byzantine period. However, if a request was associated with a third party, it could be a letter of recommendation; the protégé then often acted as a messenger. Frequently, presents (e.g. books, works of art, food, or objects of daily life) were sent along with the letter. There was not necessarily a specific purposes to the many of the hymns of praise contained in such letters, which simply seem to be flattering: the writer often degraded himself, while the addressee was exalted. The exchange of compliments was also of great importance. The attempt to gain a correspondent's benevolence (*captatio benevolentiae* – a term that comes from forensic rhetoric) through adulation was a means of achieving some purpose. If a correspondent did not reply for a long time, he might be accused with reproachful formulations, often expressed in terms derived from legal language. In spite of their stereotyped manner and of the difficulties involved in puzzling out their precise contents, Byzantine letters offer rich material for research into the various fields of history and culture of the period, provided that the modern reader is not discouraged by the flowery diction or by the many allusions, which may appear rather mystical.

After the fall of the Byzantine empire many Greek scholars emigrated to western Europe, mainly to the centres of humanism in Italy. Acting as teachers, writers, and editors of Classical texts, they brought the knowledge of Greek language and literature into the Latin west; consequently, the antique and Byzantine traditions were never interrupted. Most of these intellectuals left series of letters among their works (e.g. Constantine Laskaris and Markos Mousouros in the 15th and 16th centuries) that provide important historical and cultural evidence of their time. Between the 15th and the 19th centuries precepts for a good letter-writing style (according to the theory of letters current in the late Classical period) were widespread. Most letters were written in the vernacular language – due to the gradually changing state of the Greek language – and directed to the general public. Furthermore, compilations of specific aphorisms and expressions were produced for use in letters, to meet the increasing demand for popular and generally understandable letter-writing manuals.

A change in epistolographic style, i.e. the abandonment of rhetoric and the adoption of a more individual style, reflects the general development of European literature in the period between the 16th and the 19th centuries. Modern Greek epistolography, however, still continued to adhere to the models adopted from the Byzantines, although more specific and personal themes were dealt with in letters. It was only in the 20th century that the old patterns were gradually abandoned. In most cases correspondence is now an essential component of a writer's complete works. In addition to autobiographical information, it often contains statements that are essential for the interpretation of an artist's works.

Erasistratus *c.*315–*c.*240 BC

Physician

Erasistratus is known as the father of physiology. Born into a medical family in Iulis on the island of Ceos, educated in Athens in the peripatetic philosophy of Aristotle and Theophrastus, he later learned medicine on the island of Cos. Aristotle's son-in-law Metrodorus taught him medicine. Around 293 BC he was a court physician to Seleucus I Nicator and worked mostly in Antioch in medical practice. By tradition, he became a member of the Museum in Alexandria. Later writers, such as Celsus, associated Erasistratus and Herophilus as colleagues in research in the Museum, but some modern scholars are sceptical that Erasistratus was actually in residence in Alexandria. More likely he conducted his anatomical research there, since it is doubtful that dissections could have been conducted elsewhere.

The leisurely research environment of the Museum and his previous philosophical and medical practice enabled Erasistratus to examine the physiology of the body in a comprehensive system. He provided original and important observations on the functions of blood, air, digestion, and nerves that were probably explained in his work *Oi Katholou Logoi* (*General Principles*). None of Erasistratus' works is extant, but, because later authors, especially Galen, referred to him extensively, his ideas are preserved. Although Erasistratus

influenced physiology, medicine, and, to some degree, philosophy, his major influence was confined to specific contributions.

Erasistratus' system combined a mechanistic system of bodily functions influenced by his Stoic teacher, Chrysippus, and by his anatomist colleague at Alexandria, Herophilus. Also influential on his thinking were the peripatetic teleology of causation and an abiding commitment to empirical verification, perhaps derived from Strato. Dissection of human cadavers was conducted at the Museum. The Roman medical writer Celsus (early 1st century AD), attributed vivisection of condemned criminals to both Herophilus and Erasistratus. Later Christian writers (Tertullian and Augustine among them) repeated the accusation. Many modern scholars are sceptical because Galen, who employed Erasistratus' works extensively, made no mention of the practice, but he described Erasistratus' vivisection experiments with animals. However, Erasistratus himself did say that the examination of dead bodies can be deceptive in terms of what we may learn about the functions of live bodies.

Erasistratus wrote on abdominal pathology. Gargilius Martialis (*fl.* 3rd century AD) referred to Alexandrian deep autopsies for the cause of death. In particular he spoke of an examination of death by lice-induced typhus where death was detected by changes in cardiac tissue. Whereas Gargilius did not specifically name Erasistratus, he is the only one at Alexandria whose name is associated with autopsy.

Erasistratus' assertion that the heart was central to both the venal and the arterial systems has led some modern scholars to claim that he foresaw the circulatory system, but this is not the case. Erasistratus thought that the heart pumped blood through the venal system to all the parts of the body to convey nourishment. The liver transforms nutriments from the digestive tract. Galen would later assign a greater role to the liver because he did not accept Erasistratus' assertion that the heart completes the process started by the liver. To Galen the liver was the beginning of the venal system, not the heart. According to Erasistratus nourishment in the form of blood reaches its destination in tiny particles through very fine pores. The arterial system delivered vital spirits in air (*pneuma*), and some of the vital spirits in blood pumped by the left heart ventricle are transformed by the brain into psychic spirits (another *pneuma*) and subsequently conveyed through the nerves to all body parts. Each form of *pneuma* from veins, arteries, and nerves ultimately was delivered through such fine networks as to be invisible. Thus the organism was a combination of three mechanisms: appetites (*orexeis*), energies or forces (*dynameis*), and substances (*hylai*).

According to Erasistratus, the process which supplies nutriments in the form of blood from its production centre in the liver pumped by the heart to all parts, is analogous to the function of water in the garden. Just as in the garden, the water is consumed and so is the blood. The observation that a severed artery spurts blood is because of a vacuum created by the outflowing air. The vacuum's action (*horror vacui*) also causes the flow from the veins and nerves throughout the body. Perhaps Erasistratus' mechanical action was derived from or inspired by Strato.

Erasistratus demonstrated the metabolic process in a famous experiment with birds, the details of which are preserved in the tract *Anonymous Londinensis* of the 6th century AD. A bird or similar animal would be deprived of food for some time, then it would be weighed, as well as its excrement, over a period of time. The postulate is the loss of weight of the combination of excretions and the animal is accounted for by the equivalent consumption of nourishment.

He wrote in a lost work, *On Fevers*, that fevers resulted from inflammations, a theory rejected by Celsus and Galen. He regarded as a main cause of disease an excessive flooding of the blood, because excessive nourishment ultimately compresses *pneuma* in the extremities of the arteries, thereby causing inflammations. Like Herophilus, he thought that men and women had the same diseases, none being peculiar to a single sex. Both Erasistratus and Herophilus saw the differences between sensory and motor nerves. Erasistratus rejected most therapeutic uses for bloodletting, again supplying the rejection by later medical writers who knew his works.

Although many late Greek and Roman writers cited Erasistratus' works, especially Galen, none adopted his medical system, and yet all were influenced by Erasistratus' specific contributions about the body's functions.

Eratosthenes

Scholar of the 3rd century BC

Eratosthenes, son of Aglaos, was a renowned scholar, poet, and scientist. His family was Cyrenean and was probably not of substantial means, although it could afford to send him to Athens for his education. His birthdate cannot be established

with certainty. The *Suda* places his birth during the 126th Olympiad (276/275–273/272 BC), but this is too late and scholars now put his birth in the mid-280s BC. Eratosthenes did not receive his education at nearby Alexandria, but rather went to Athens to pursue philosophy. He studied with Zeno, founder of the Stoic school, Arcesilaus, head of the Platonic Academy, and Ariston of Chios, who had established a new branch of the Stoa. His varied philosophical studies reflect the eclecticism that consistently informed his life's work.

In 245 BC, at the age of about 40 and on the strength of his growing reputation in the fields of poetry, mathematics, and geography, Eratosthenes was invited by Ptolemy III Eurgetes, king of Egypt, to come to Alexandria. After the retirement of Apollonius of Rhodes, he assumed the directorship of the Library of Alexandria, one of the most prestigious positions in the ancient world. He remained there until he was succeeded by Aristophanes of Byzantium. His death, which occurred during the reign of Ptolemy V Epiphanes, may be dated to between 205 and 195 BC.

Eratosthenes was an expert in philosophy, grammar, poetry, chronology, mathematics, astronomy, and geography, and the breadth and the versatility of his intellect were both praised and censured in antiquity. Admirers called him a "second Plato". Others preferred to call him *pentathlos* ("jack of all trades"), since he was versed in so many branches of learning, or *beta* ("second best"), since he never specialized in any one area but showed enough brilliance to be considered the second leading authority in many disciplines. Each term was used in both derogatory and complimentary contexts. Eratosthenes himself coined the term *philologos* ("scholar" or "lover of learning") to describe his scholarly activities.

His works are known only by title or through fragments. No comprehensive edition of the fragments exists, although fairly good editions of individual areas have been published. His three-volume work *Geography* and his *On the Measurement of the Earth* epitomize his scientific spirit. Eratosthenes broke from his predecessors in rejecting Homer and mythology as trustworthy sources of geographical information and relied instead on his training in mathematics and astronomy and on the immense resources available in the Library at Alexandria. The *Geography* was intended to describe the entire inhabited world. In book 1 he attacked the use of Homer in geographical studies and pointed out the flaws of previous geographical works, which had now been rendered obsolete by the extensive information garnered from the military expeditions of Alexander the Great. In book 2 he fixed the world's breadth and length, and in book 3, he used his measurements to construct a map of the world. Eratosthenes' anthropology, set forth in book 2, is remarkable, in so far as he rejected the traditional categories of "Greek" and "barbarian", preferring to regard people on the basis of good and bad qualities. In *On the Measurement of the Earth* he used his mathematical skills to calculate the earth's circumference, which he fixed at 252,000 stades or 24,662 miles (accurate to about 1 per cent).

Eratosthenes is accredited with establishing the field of scientific chronology. He revised the existing Olympic victor lists (widely used for determining dates) and published his revision in two books. Using those Olympic lists and, for prehistoric events, the lists of Spartan kings, he wrote his own *Chronology*, which established a timetable from the Trojan War (which he dated to 1184/83 BC) down to the death of Alexander (323 BC). Eratosthenes divided this 860-year period into 10 epochs, with events listed in the form of chronological tables.

Eratosthenes was eclectic in his approach to philosophy. He received his training from the Platonist Arcesilaus and the Stoic Ariston; he also heard the teachings of the Cynic Bion of Borysthenes. Eratosthenes' philosophical writings, which survive only in a few fragments, probably predate his arrival at Alexandria. The *Platonicus*, penned in the traditional dialogue format, dealt with Platonic astronomy and mathematics. Other works, such as *On Freedom from Pain*, *Ariston*, and *On Good and Evil Qualities*, have been lost. Many later writers heaped scorn on Eratosthenes' philosophical treatises, but their attacks are heavily flavoured by sectarian biases.

Eratosthenes was considered one of the great mathematicians of his day; Archimedes dedicated a book to him and corresponded with him on mathematical problems. Little remains of his works, however. He developed a method for determining prime numbers, the so-called Sieve of Eratosthenes, which in modified form (needed, since the system does not work with high numbers) is still critical for number theory research; he wrote on progressions and proportions; he solved the problem of how to double a cube, for which he designed a mechanical instrument; and he discussed musical scales. He applied his learning in geometry to the fields of astronomy and mathematical geography. For example, he measured the distance to the sun as 804 million stades (= 78 million miles, versus the actual 92.9 million) and to the moon as 780,000 stadia (= 76,500 miles, versus the actual 239,000). The tilt of the earth's axis was calculated, with great accuracy, as 23 degrees, 51 minutes, 15 seconds. A lost treatise, *On Means*, has not survived, but it did form part of the Hellenistic edited collection *Treasury of Analysis*, which contained works by such famous mathematicians as Euclid.

In the field of literary criticism, Eratosthenes' most important work was *On Ancient Comedy*, in 12 books. This work was very highly regarded in antiquity. Evidently he wrote essays on a wide variety of topics, such as textual criticism, authorship of plays, dialectology, dates of performances, historical issues, and the interpretation of individual passages. Although he published no editions of the plays, Eratosthenes did collate available manuscripts to fix textual readings.

Very little of Eratosthenes' poetry survives. Traces of Callimachean Alexandrinism are evident. For example, Eratosthenes' short epic *Erigone*, dealing with Icarius and his daughter Erigone and her dog, evokes with its style and form Callimachus' *Hecale*. His didactic poem *Hermes*, which describes the god's ascent to the heavens, recalls the didactic poems of the 3rd century BC, especially when Eratosthenes describes the eight spheres of the universe. Otherwise, Eratosthenes displayed in his poetry his usual independence of thought. For example, he rejected Homer and mythology as useful sources of poetic material – a view that was severely criticized, since the Greeks generally believed in the centrality of Homer in culture, history, and literature; he also insisted that the purpose of poetry was to entertain, not to instruct (a principle he called *psychagogia*).

Eratosthenes was vastly unappreciated in antiquity. He had few disciples, and his writings were often subjected by later writers to scathing attacks. The nickname *beta* was an ingenious but unwarranted term for someone who was truly brilliant in so many areas. He was one of those rare people for whom the sciences and the humanities are complementary. Applying his powerful intellect to fields as diverse as mathematics, chronology, literary criticism, geography, and philosophy, Eratosthenes had few equals in his or any other era.

STEVEN M. OBERHELMAN

Biography

Born perhaps in the mid-280s BC in Cyrene, Eratosthenes was educated in Athens where he was a pupil of Zeno, Arcesilaus, and Ariston. At the invitation of Ptolemy III Eurgetes he moved to Alexandria in 245 BC where he succeeded Apollonius Rhodius as director of the Library. He made distinguished contributions to philosophy, grammar, poetry, chronology, mathematics, astronomy, and geography but was too versatile to be appreciated by his contemporaries. He died *c.*200 BC.

Eretria

City in Euboea

Eretria is the second principal ancient city on the island of Euboea, the first being its immediate neighbour to the north, Chalcis. In 498 BC the Eretrians joined the Athenians in sending help to the east Greek Ionian cities in their rebellion against their Persian overlords; the Eretrians contributed 5 triremes and the Athenians 20, which Herodotus says were the cause of evil for both Greeks and Persians alike. Though this achieved little enough on behalf of the Ionians beyond sacking sanctuaries at Sardis, when the Persians in their turn attacked mainland Greece in 490 BC Eretria was one of their first targets. After forcing the surrender of the southernmost Euboean city, Carystus, the Persians disembarked at Eretria without opposition and put the walled city under siege. The city was betrayed to them after six days' resistance; they burnt and plundered the sanctuaries, in revenge for the burning of the sanctuaries at Sardis, and deported at least part of the population (they were settled by Darius near Susa, and they or their descendants were still there in Herodotus' time continuing to speak Greek, as he notes with some surprise). Doubtless more were left at Eretria following the surprise defeat of the Persians at Marathon, since there was no interuption in the continuity of the city.

The geographer Strabo, writing in the 1st century BC, mentions, in addition to the existing city of Eretria, the ruins of "Old Eretria", which he believed was the city destroyed by the Persians; the remains of houses were still visible there. Excavations at Eretria itself have demonstrated that this was not correct, that the walled city captured and plundered by the Persians was the same one that existed in Strabo's time, and which, indeed, had been the location of the city since much earlier, at least as early as the 8th century BC. What Strabo saw as "Old Eretria" was elsewhere. The most likely candidate is situated to the north of the Classical city, closer to Chalcis, on a promontory site known by its modern Greek name of Lefkandi. Here an earlier settlement and, adjacent, an extensive cemetery have been excavated going back to the turn of the 2nd and 1st millennia BC, including one extremely rich grave in a large apsidal structure surrounded by wooden posts. This site seems to have been abandoned gradually, at the same time that the site of Classical Eretria developed. Whether or not there is a direct connection, the movement of inhabitants from the one to the other, Lefkandi must be significant to the early history of the Eretrians.

In general, this area, including Chalcis, had benefited from its geographical position, facing on to the sheltered waters between Euboea and the mainland and the sea route to the southeast, past the islands of Andros and Tenos (which are a continuation of the Euboean land-mass) into the central Aegean and beyond, encouraging direct trade links through to the eastern Mediterranean (while Chalcis, situated at the narrows of the Euripus, also controlled the sea routes to the north). The link with the central Aegean had been important even in the Early Bronze Age, while the evidence from Lefkandi proves the existence of overseas contacts even at the beginning of the Iron Age when mainland Greece apparently survived in isolation. After this, Eretrian involvement in the Greek trading

post at al-Mina in Syria and the distribution, to both east and west, of the Euboean pottery drinking cups decorated with suspended groups of semicircles (the "pendant-semicircle *skyphoi*") demonstrate the importance of overseas links. Both Chalcis and Eretria, possibly in conjunction, played a major role in the early colonization movement, such as the colony on the island of Ischia in the bay of Naples. Eretria is also credited with the earliest colonization of Corfu, though this was soon supplanted by a Corinthian foundation.

What the later Greeks remembered of this period was a war between Eretria and Chalcis, over possession of the Lelantine plain which was situated between them. Herodotus points out that the reason the Eretrians helped the Ionians in 498 BC was not support for the Athenians but because Miletus had earlier helped them in their war against Chalcis. Thucydides also mentions grand alliances, with the "rest of Greece" divided into supporters of one or other of the Euboean cities. Whether these alliances are a historical reality, or a projection back into the unrecorded early period of later political links, cannot be resolved. It may well be that defeat at the hands of Chalcis forced the Eretrians to abandon the site at Lefkandi and move to the Classical site of their city.

The early significance of Eretria is demonstrated by the archaeological discoveries there. The principal sanctuary in the city, that of Apollo Daphnephoros, boasted a major limestone Doric temple of the late 6th century BC with high-quality sculptural decoration in marble, fragments of which survive. It was sacked by the Persians. Its earliest antecedent was a small apsidal structure of the 8th century BC, one of the oldest temple buildings to be found in Greece. Other shrines included a heroon of the 7th century BC, and a Thesmophorion, also sacked by the Persians, where the finds include a deposit of drinking vessels, presumably used in the cult rather than left as offerings. Links with Athens were close: the arrangement of the late Archaic temple of Apollo Daphnephoros seems to anticipate the hexastyle Athenian temples such as that of Hephaestus (the "Theseum") and of Poseidon at Sunium, where the original construction is dated before the Persian Wars. At the time Eretria joined Athens to help the Ionians, the Athenians had just fought a successful war against Chalcis, seized a substantial part of Chalcidian territory, and placed Athenian settlers on it, a move that must have benefited Eretria – Herodotus, perhaps, is being a shade too knowledgeable when in effect he denies this as a reason for Eretria's support of Miletus in the Ionian revolt.

The city recovered from the Persian attack, and became part of the Athenian alliance, along with Chalcis and the other Euboean cities. Their importance was such that their rebellion in 446 BC forced the Athenians to make a quick deal with the Spartans so that they could suppress it. We have an inscription that details the harsh terms then inflicted on Chalcis, with enough evidence to show that similar conditions were meted out to Eretria. Part of Eretrian territory may have been occupied by Athenians; certainly, there was an Athenian stronghold there (but outside the city) in 411 BC, and the discovery at Eretria of large numbers of Athenian "white-ground" vases (*lekythoi*), of the sort favoured as burial offerings in Athens in the latter part of the 5th century BC, suggests the presence of an Athenian population. Eretria finally broke away from Athens in 411 BC, after the Syracusan disaster, but in the succeeding century joined the second Athenian alliance. Philip of Macedon took the city into his sphere of interest – a Macedonian presence is subsequently attested by two vaulted Macedonian chamber tombs, one at Eretria itself and another by the road to Amarynthus to the south. During the Hellenistic period the strategic importance of this area was emphasized by the continued presence of a Macedonian garrison at Chalcis, one of the three vital strongholds, the so-called fetters of Greece. Eretria, under the shadow of this presence, seems to have had its own Macedonian garrison, at least at the time of the final war between the Romans and the Macedonian king, Philip V. During this, in 198 BC, the city was attacked and sacked by the Romans. After this, despite a short involvement in the subsequent war with Antiochus III, Eretria regained its freedom, and enjoyed a subsequent uneventful history as a small town of the Roman empire.

There are interesting architectural remains. The city walls, originally constructed in the 7th century BC (the date of the first west gate), have been partly uncovered. Sections of the early (pre-Persian) walls survive on the acropolis, while the existing traces of the walls of the lower town are probably late 4th century BC, with later repairs and additions. There are early Hellenistic houses, some of which have good-quality pebble mosaics. Most interesting of all is the theatre. Unlike most Greek theatres it was constructed on level ground, by hollowing out the orchestra and banking earth up against a surrounding support wall for the cavea. There is also an underground passage, of uncertain purpose, running from the stage area to the centre of the orchestra.

R.A. TOMLINSON

Summary

A city in Euboea, Eretria, like its neighbour Chalcis, played a part in colonizing Italy, Sicily, and the north Aegean. The two cities fought over possession of the Lelantine plain in the late 8th century BC. Eretria was a member of the Delian League and the second Athenian confederacy. It was sacked by the Romans in 198 BC.

Estates

Much of the history of the Greek countryside has been characterized by the struggle between state, wealthy landowner, and peasant for control of the productive agricultural land. Given the very varied nature of the Greek landscape, it was often advantageous to produce a particular cash crop on a large scale and export it to less suitable areas. This mode of production tended to favour the wealthy landowner who controlled large estates.

The first evidence for estate agriculture, as opposed to communal or individual subsistence production, comes from the Bronze Age. During the 17th and 16th centuries BC a series of large rural structures in eastern Crete, generally termed "villas", shows evidence for mass storage, high-status residence, and administration. These were presumably involved in the production of the wine, olive oil, and wheat mentioned in the Linear A texts. In the Linear B tablets from the Mycenaean palace of Pylos, dating to about 1200 BC, many individuals are listed as owning estates. The king's estate, which may have been one of several royal estates, was 1800 times as large as the smallest one on the list, and three times as large as those of his most senior subordinates.

The Archaic and Classical periods were characterized by widespread small landholding, often by tenant farmers who were very vulnerable to their landlords and creditors. Archaeological survey shows a wide distribution of small structures and intensive cultivation during this time. In the course of the Hellenistic period this gradually changed, with small farmsteads being abandoned and larger landowners, often based in the cities, gradually controlling more of the land. By the early Roman period much of the Greek countryside was dominated by large estates. Few of these were actually owned by Romans; in general there is little evidence for imperial estates, colonies of veterans, or estates owned by Roman aristocrats. The pattern was more one of large estates owned by rich local families who favoured and were favoured by Roman rule. Often they were based on villas sumptuously decorated with mosaics and equipped with bath houses. This was just one aspect of the increasing social stratification and economic polarization that characterized the period.

Estates were also an important part of the Byzantine landscape, though in many cases landowners owned a series of small dispersed plots, or several estates in different areas. The tenant farmer or *colonus* was very much tied to the land and heavily taxed, as well as paying rent to his landlord. A typical large estate would include some sort of mansion, demesne land as well as land let out to tenants, and a whole series of productive assets termed *autourgia*, such as olive groves, watermills, salt pans, and pottery workshops. The estate often encompassed all or part of a village where hired workers or tenants would live. Many monasteries increasingly had their own estates, with *metochia* or branches of the monastery to house the monks who supervised them.

The advent of the Ottoman empire caused major changes in landholding and the rural economy. Each Ottoman *spahi* or cavalryman was allotted a fief of varying size according to his rank. Usually this would consist of an entire village, but rather than managing it as an estate he would merely extract a proportion of the villagers' produce, and this would constitute his income. Other villages were estates owned by a *waqf* or Islamic endowment, or else by members of the imperial family.

In Asia Minor, from the end of the 16th century, there was a general process of appropriating the land of peasant farmers, either by force or because of debt. This land was amalgamated into *çiftliks* or estates, originally referring to the amount of land that could be worked by a *çift* or pair of oxen. By the end of the 18th century the *çiftlik* system had arrived in northern Greece. Typically estates would consist of a manor, often fortified with a tower, huts for hired workers, stables, large storerooms, a bakery, a smithy, and a watermill. Usually they were associated with a village of tenant farmers.

During the 17th and 18th centuries the Church and individual monasteries acquired considerable amounts of land, usually by bequests from Greek peasants who wanted to avoid their property being taken by the Ottoman authorities. In Cyprus by 1844, for example, the Church owned some 16.4 per cent of all agricultural land. As with the secular estates, they were mainly concerned with the production of cash crops on a large scale, as well as a range of subsistence crops for local consumption. The export trade in commodities such as cotton and wheat greatly favoured an estate that had a large labour force, controlled the necessary water rights, and could produce on a large scale.

The end of the estate system came after World War I, following the land law passed in 1917 by Venizelos's government. Large estates were broken up and redistributed to each family that had been tilling the land as hired hands. This expropriation extended to many of the monastic estates, including those of the Mount Athos monasteries. After the Asia Minor defeat in 1922 many of these confiscated lands were given to incoming rural Greeks from Anatolia as part of the refugee settlement process. To some extent this meant that agriculture and landholding remained fragmented and often less efficient. It did, however, allow for a strong landowning rural class, as opposed to a dissatisfied and oppressed rural population of serfs and hired labourers, which throughout Greek history has so often been the end result of the estate system.

Ethics

Although ethical precepts of a rudimentary nature are found scattered throughout early Greek poetry and the surviving fragments of the Presocratic philosophers, there was no real attempt to formulate a coherent ethical system before the time of Socrates, Plato, and Aristotle. The Delphic maxims and the sayings attributed to the Seven Sages, epigrammatic lines from Hesiod and the gnomic poets, and early philosophical fragments, such as those of Xenophon and Heraclitus, provide early examples of attempts to collect and codify ethical wisdom gathered through the experience of many generations. Even the Homeric epics, with their professedly recreational objectives, came to be treated as storehouses of advice on human conduct.

Pythagoras (*c.*580–*c.*500 BC) founded a brotherhood which (probably under Orphic influence) appears to have advocated vegetarianism associated with the belief in transmigration of the soul. The brotherhood's rules emphasized simplicity in speech, dress, and food; for Pythagoras believed that the intellectual nature is higher than the sensual, and that the best life is one devoted to mental discipline.

A note of scepticism was sounded in the 5th century BC when the Sophists questioned moral absolutes. Their common theme was that the traditional opposition of good and bad, or just and unjust does not reflect any objective fact of nature but is rather a matter of social convention. Protagoras of Abdera taught that "man is the measure of all things: of the things that are that they are, of the things that are not that they are not", meaning that human judgement is subjective, and that one's perception is valid only for one's self. The particular content of moral rules may differ, but rules of some kind are necessary, he argued, if life is to be tolerable.

But even this attempt to set up a new standard for interpreting moral actions fell before the onslaught of that very scepticism which Protagoras himself initiated. The laws and codes of society were shown to be themselves a perversion of the natural state of man. Society was depicted, as by Glaucon and Adeimantus in Plato's *Republic*, as the product of a social contract in which *physis* (i.e. natural law that "might is right") was prevented by *nomos* (i.e. established laws of society and the state) – an artificial code made by the weaker many to suppress the stronger few. Tyrants and suchlike were those who broke through these codes and asserted the primeval right of might. True justice was the interest of the stronger. It was better to do evil than suffer evil, and having done evil, it was better not to pay the penalty than to pay the penalty. The possible consequences of such a doctrine, if translated into action, can well be imagined if one reads its representation by Thrasymachus and Callicles in the *Republic* and *Gorgias* of Plato.

Despite his ruthless criticism of the Sophists, Plato was well aware that it was by countenancing their destructive criticisms that Socrates (470–399 BC) was able to establish ethical values on the sound basis of knowledge. Socrates' contribution to ethics is best described as a way of inquiry rather than a way of life. He would ask for a definition of a virtue such as justice, courage, piety, or temperance and then, through questioning, he would demonstrate the inadequacy of the definition as a complete account of the virtue in question, and suggest the need to reformulate the definition. This method of inquiry was bound to undermine the security of conventional beliefs, and Socrates was therefore tried on a charge of corrupting the youth of Athens and was put to death. He did not subscribe to the moral relativism of the Sophists, but maintained that virtue could be known and that the good person knew what constituted virtue or justice. However, he himself did not claim to have such knowledge. Nor did he distinguish sharply between the good and the advantageous, but maintained that those who knew what good was would in fact be good. If anyone did what was not good, it was because he was ignorant of the nature of goodness. Thus, a person can become good through education.

Socrates' life and teaching gave rise to many later schools of moral philosophy. Four such schools originated among his immediate disciples: the Cynics, the Cyrenaics, the Megarians, and the Platonists. The Cynics held that self-control was the essence of virtue and that it could be taught. This was, in particular, the view of Antisthenes. The Cyrenaics were hedonists: for them pleasure was the highest good, provided it did not dominate one's life. Pleasures could not be ranked by superiority; they could only be measured by intensity and duration. The best-known member of the school was Aristippus of Cyrene. The Megarians (founded by Euclid of Megara) maintained the unity of goodness despite its equation with wisdom, god, or reason. It is the final secret of the universe, and can be revealed only through logical inquiry.

For Plato (428/27–348/47 BC), goodness is an essential element of reality. It is the common element by which all good things are good, in other words, the pure form of goodness. Not only good things, but all other forms too (being themselves good) depend on the form of the good for their sustenance and manifestation, just as all things in our world depend on the sun. Evil has no independent existence; it is an imperfect reflection of the good reality. The virtue of anything depended on its function, and human virtue lies in the fitness of a person to perform that person's proper function in the world.

Plato believed in a tripartite soul (and its "bigger" version, the state) consisting of the rational, the emotional, and the appetitive, each with its corresponding virtue: wisdom, courage, and temperance. Justice, the fourth virtue, consisted in the harmony between these three elements, when each part of the soul kept to its appropriate place and function: intelligence must rule, emotion must obey, and the two together must control the appetite. While the unjust man lives in a state of internal strife, the just man, whose soul is thus harmoniously ordered, finds true satisfaction in the pursuit of knowledge. Plato doubtless saw in the life and death of Socrates the concrete embodiment of his ideal of the just man.

With Plato, just as with Socrates, the basic problem of ethics becomes a problem of knowledge. He who knows that moral virtue leads to happiness will naturally practise virtue. This is different from the view of many Christian thinkers who feel that the fundamental problem of ethics is one of will, since a person may know what is morally right, but may not have the willpower to carry it out.

Plato maintained that it is worse to do evil than to suffer it, because immoral conduct is symptomatic of a sick soul. Once a person has committed an unjust deed, Plato believed that it

is better for him to be punished than to go unpunished, because punishment serves to cure the soul of its most serious ills.

For Aristotle (384–322 BC), the aim of life was happiness, which he defined as activity that accords with the specific nature of humanity. Although such activity is accompanied by pleasure, such pleasure is not its principal aim. Happiness results from the activity of reason (an attribute unique to mankind) functioning in harmony with human faculties.

While accepting the four-fold virtues of the Platonic system, Aristotle maintained the importance of other traits such as friendship, liberality, gentleness, truthfulness, and wit. But the most important was prudence (*phronesis*), i.e. the ability to discern the right course of action that leads to a good life. For him, virtues are essentially good habits acquired by constant practice, and he makes a distinction between moral and intellectual virtues. In connection with moral virtues, he introduces the famous doctrine of the mean. A moral virtue is a mean between two extreme vices, one of excess and one of deficiency. Thus liberality is a mean between avarice and profligacy, and courage is a mean between cowardliness and foolhardiness. Intellectual virtues such as knowledge lead to contemplation, which is the highest human activity. Both these kinds of virtue are only a means towards the attainment of happiness, which results from the full realization of human potential.

Aristotle makes a distinction between instrumental goods (which are good only because they lead to some other thing that is good) and intrinsic goods (which are good in themselves). He also distinguishes between distributive justice and remedial justice, as well as between theoretical wisdom and practical wisdom. Practical wisdom, the knowledge which leads people to right action and a happy life, is the subject of both politics and ethics.

Like Aristotle's other works, his *Nicomachean Ethics* prompted commentaries, glosses, and paraphrases from scholars of late antiquity and the Byzantine age. Two sets of scholia are known, the first and more ancient being anonymous, and the second by Aspasios. Partial commentaries by Michael of Ephesus, Eustratios of Nicaea, and an anonymous Byzantine scholar are preserved in a Latin translation by Robert Grosseteste, Bishop of Lincoln (1253). A paraphrase was copied for the emperor John VI Kantakouzenos. This exegetical material gave rise to summaries of ethics such as those by John of Damascus, Michael Psellos, and Joseph Rhakendytes.

The chief Stoic philosophers in Greece were Zeno of Citium, Cleanthes, and Chrysippus of Soli, while the development of Stoicism under the Roman empire is represented by Epictetus and the emperor Marcus Aurelius. There were also a number of popular moralizing anthologies, and a treatise *De Virtutibus et Vitiis* is attributed to Andronicus of Rhodes. Stoic impact on Byzantine writers is evident in works such as Plethon's treatise *On Virtues*. According to Zeno, the true end of man is an active life in conformity with nature, in other words, a life according to virtue, which is the will of God and hence the law of the universe. Happiness is produced by right conduct. Originating from the views of Socrates and Plato, Stoicism taught that nature was rational and orderly, and that the only good life was one led in harmony with nature. Since life is influenced by material circumstances, one should free oneself from them as much as possible. This freedom could be achieved by cultivating certain cardinal virtues such as practical wisdom, fortitude, discretion, and justice.

Whereas Plato believed that human passions and physical desires must be regularized by reason, the Stoics rejected passion altogether as a basis for deciding what is good or evil. Although one cannot completely eliminate physical desires, a wise person can appreciate the difference between wanting something (which is caused by our desires) and judging it to be good (which is caused by our reason). The wise man identifies himself with reason, not with desires, and will neither expect the fulfilment of physical desires nor be anxious about failing to attain them. Living in a state of wisdom and virtue is the only real good, and the efforts to attain it are not hampered by external circumstances as is the search for material wealth and bodily pleasure, since wisdom and virtue are intellectual matters and therefore are within our control.

The Stoics believed that all human beings have the capacity for reason, and therefore held a notion of equality much broader than the Greek sense of equal citizenship: common reason makes all individuals fellow citizens, observed Marcus Aurelius. From this followed the Stoic concept of a universal moral law appealing to all people. This universality of reason provided a basis for rejecting ethical relativism as taught by the Sophists. The pursuit of wisdom and virtue is open to all human beings irrespective of the external circumstances of their lives, and it is not surprising to find that the two principal exponents of Stoicism in the 2nd century AD were a slave and an emperor. Stoicism also exerted considerable influence on Byzantine monastic circles.

Plotinus (born *c.* AD 215), the founder of Neoplatonism, enjoined purification by self-discipline, with the object of ascending to the spiritual world and pursuing the divine out of love and enthusiasm. Some idea of the ethical theory of the Neoplatonists may be gained from its formulation in the *Sentences* of Porphyry. According to Proclus and Ammonius, evil is not a substance, but a privation of good; in particular, it was a moral turning away from God. This theory of evil and its reconciliation with free will and divine providence were adopted by Psellos and Isaac Komnenos. The Neoplatonists identified happiness as union with God. This was to be achieved in contemplation through purifying the soul of its corporeal existence by virtue. Through the Cappadocian fathers, this identification provided a fundamental structure to Byzantine moral theology. Psellos believed that Aristotelian ethics could be integrated into this structure in that "political virtue", which is the lowest type, concerns the rationally ordered and harmonious life of man as a union of soul and body, a life formulated by Aristotle and including practical wisdom and political action. To this, Porphyry had added purificatory and contemplative virtue, and Psellos saw in them the path that leads man as immortal soul to transcend the world and reach greater union with God. A similar integration of Stoic ethics (which prescribes the ideal life of man as he is) with the Platonic (concerned with life beyond this world) was proposed by Barlaam of Calabria in his *Ethics According to the Stoics*.

Epicurus (341–270 BC) taught that the only ultimate good was pleasure (being the only good known to the senses) and that the only ultimate evil was pain. The best pleasure, that

which is accompanied by no painful want, is a perfect harmony of body and mind to be sought in plain living and in virtue. Intellectual pleasures were the more refined, and were higher than the coarser physical ones purely in terms of their quantity and durability. Tranquillity (*ataraxia*) is the highest pleasure obtainable, and comes from the removal of all emotional disturbances resulting from unsatisfied wants, through the elimination of all but the simplest needs which are then easily satisfied even by those who are not wealthy. What the Epicureans advocated, therefore, was a temperate, even ascetic, existence devoted to contemplative pursuits. If something increased pleasure and reduced pain, it was good as a means; otherwise it was not good at all. Justice was good only as a way of preventing mutual harm; but injustice brought pain and anxiety only through the perpetual fear of being discovered. The Epicureans placed high value on friendship and were famous for the warmth of their personal relationships; but friendship was good only because it tended to increase pleasure. It was believed that immediate pleasures should be postponed in order to attain more secure and durable satisfaction in the future. Therefore, the good life must be regulated by self-discipline. Religious beliefs and practices were considered harmful because they preoccupied men with disturbing thoughts of death and the uncertainty of life after death.

Etruscans

The Etruscans, a culturally unified people who settled in central Italy (between the Arno and the Tiber rivers) from around the beginning of the 1st millennium until the 1st century BC, were referred to by the ancient Greeks as the *Tyrrhenoi* (Tyrrhenians), a name that they also gave to the sea off Tuscany, still known today as the Tyrrhenian Sea. Undoubtedly, this name was given to the Etruscans because many Greeks believed that they had emigrated to Italy from the east, specifically from Lydia in Asia Minor, and were led away from a devastating famine by the son of the Lydian king, who was called Tyrrhenus (Tyrsenos). This story is preserved by the Greek historian Herodotus (1. 94. 2), writing in the 5th century BC, and is typical of traditional Greek explanations of the origins of people or city states, i.e. they began as the result of a migration under the leadership of a mythical founding hero. Other Greek historians (e.g. Hellanicus and Anticleides) had similar beliefs about the eastern origins of the Etruscans and connected them with the Pelasgians, an ancient wandering people who eventually settled on the coast of Italy. The one ancient exception to this view is the Greek historian and rhetorician Dionysius of Halicarnassus (1. 25–30), writing towards the end of the 1st century BC, who argued that the Etruscans were autochthonous. This, according to Dionysius, was the Etruscan view of the matter. Indeed the Etruscans did not call themselves the Tyrrhenians at all, but referred to themselves as Rasenna or Rasna. This is also the view of most modern scholars who, as the result of decades of archaeological study, now believe that the Bronze Age inhabitants of central Italy (from *c.*3000 to 1000 BC) should be considered the ancestors of the Iron Age inhabitants, i.e. the Etruscans.

Unfortunately, because Etruscan civilization was relatively short-lived and because their once extensive literature was either obliterated by the Roman conquest or else simply failed to survive the process of transmission during the Middle Ages, very little is known about the internal events of Etruscan history. The archaeological record and the incidental references to the Etruscans by contemporary Greek and Roman writers are not complete or always reliable sources of information about Etruscan culture. However, these sources do yield considerable information about the trade relations between Greeks and Etruscans. For example, the early Euboean colonies at Pithecusae and Cumae were deliberately well situated for trade with Etruria and, by the end of the 8th century BC, Etruscan culture was largely transformed and Hellenized by Greek and other eastern objects and techniques that were introduced by the colonists. In the 7th century BC many Corinthian and east Greek vases made their way to Etruria, and by the 6th century BC the market was dominated by fine Athenian wares. There is also evidence that in the 6th century BC many Greek potters worked with Etruscan taste in mind. For example, the class of pottery known as "Tyrrhenian amphorae" features especially colourful narratives with nonsensical inscriptions that were unlikely to be recognized as such by the Etruscan buyers. Other ingenious potters, such as Nicosthenes, began supplying the brisk Etruscan market with types of vases familiar to the Etruscans from their own native *bucchero* pottery (e.g. the so-called Nicosthenic amphorae and *kyathoi* or wine ladles), but decorated in the popular Greek black-figured style.

In exchange for Greek pottery and other imported objects (Near Eastern seals, bronzes, etc.) it seems that the Etruscans mainly traded raw materials (metals). During the 8th and early 7th centuries BC, however, some Etruscan objects do begin to appear in the votive deposits at several international Greek sanctuaries (e.g. Delphi, Olympia, Dodona, and Samos). These objects are not trade goods but typical Italic votive offerings such as bronze helmets, shields, horse bits, and other ornaments. In fact, according to Pausanias (5. 12. 5), it was the Etruscan king Arimnestos who made the very first dedication (a throne) at Olympia. During the 6th century BC Etruscan merchants seem to have circulated more widely, since their native *bucchero* pottery has been found at nearly every major site in Greece except for the international sanctuaries of Delphi, Olympia, Isthmia, and Nemea, which instead attracted finer Etruscan donations, such as bronzes, art objects, and war

trophies. Most of the *bucchero* vases found in Greece are tall stemmed cups with two vertical handles – a shape that inspired the development of the *kantharos* (large-handled cup) in Boeotia and Athens. The Athenian Agora has produced a few examples of Etruscan *bucchero*, although the bulk of Attic trade with the Etruscans occurred later than the production of this type of pottery. So, in the later 6th and 5th centuries BC, the Etruscans probably traded other goods such as bronze utensils, candelabra, tripods, and spouted pitchers (known today as *Schnabelkannen*) which were widely admired by the Greeks.

The influence of Greek imports on Etruscan art is easily recognized as well. Native artists copied the Euboean Geometric and early Orientalizing styles as well as all the Corinthian styles down to the middle of the 6th century BC. Greek shapes were introduced into *bucchero* pottery. Athenian black- and red-figured pottery was also imitated by local artists, and Greek subjects and styles were introduced into Etruscan tomb painting. Greek influence is additionally apparent in Etruscan metalworking (particularly in the production of certain fibulae) and in the Etruscan art of architectural terracottas which was developed as the result of trade relations with the Peloponnese.

There is also evidence of Greeks who actually lived and worked in Etruria. For example, according to Pliny (*Naturalis Historia*, 35. 152), Livy (1. 34), and Dionysius of Halicarnassus (3. 46), one Demaratus of Corinth emigrated to Tarquinia (with three Greek artisans) in the middle of the 7th century BC, carried on a prosperous business, married a local noblewoman, and sired the fifth king of Rome (Tarquinius Priscus). Tarquinia was also home to a significant school of Etrusco-Corinthian vase painting that has been linked to Corinthian immigration. In addition, the port city of Tarquinia, Gravisca, had a wealthy Greek quarter that included a sanctuary with Greek-style temples where a syncretism of Greek and Etruscan cults took place. The Etruscan city of Caere also seems to have been partly settled by Greeks, who called it Agylla and dedicated a treasury at Delphi. At Caere an itinerant Greek artist named Aristonothos produced an interesting and unusual hybrid *krater* (mixing bowl) depicting a naval battle and the blinding of the Cyclops Polyphemus by Odysseus and his men (Paris, Louvre).

Etruscan culture was influenced by the Greek imports and immigrants in other ways as well. For example, the Greeks brought to Etruria the alphabet and the art of olive cultivation. Greek-style hunts and athletics are depicted in many Etruscan tombs, although it seems unlikely that the Etruscans accepted the social ideals that went along with these sports in Greek culture. Etruscan weapons and warfare, including the use of warships as well as the organization of the cavalry and infantry (phalanx formation), also seem to have been influenced by Greek practice. In addition, Etruscan dress was closely related to Greek models, although the Greeks were known to have admired the native Etruscan sandals with their hinged wooden soles. The Etruscan elite also adopted the practice of banqueting on couches with drinking equipment of the type used at the Greek symposium. But unlike the Greeks, the Etruscans reclined together with their wives – a practice that the Greeks thought was barbarous.

Despite this apparent cultural dependence, Greek–Etruscan relations seem to have worsened after the large Etruscan fleet was defeated at Cumae in 524 BC by the Greeks and the Latin alliance. At this time, the Greeks controlled the overland routes into Campania and soon after they gained control of the seas as well. By the end of the 4th century BC, trade with Greece had declined considerably and very few dedications were made by Greeks in the sanctuary at Gravisca. Some Greek trade with Etruria continued in the 3rd century BC with areas as remote as southern Russia receiving a few Etruscan objects. In this small way, before they were conquered by the Romans, the Etruscans contributed to the *koine* (shared culture) of Hellenistic civilization.

ANN M. NICGORSKI

Summary

A people settled in central Italy for most of the 1st millennium BC, the Etruscans were believed in antiquity to have originated in Asia Minor, though this now seems unlikely. Trade with Greece began early and Etruscan culture was largely Hellenized by the 8th century BC. Relations with Greece cooled in the late 6th century and trade declined after the 4th century BC.

Euboea

Island in the Aegean

Euboea is the second largest Greek island after Crete and runs for about 180 km along the eastern coast of mainland Greece. It is separated from the mainland by a strait, known as the

Euripus, that narrows at the mid-point along the west coast. Euboea is separated into three geographical areas, each region defined by a major peak. The well-watered and forested north is dominated by Mount Pyxaria (1341 m). The central, most fertile, region is south of Mount Dirfis (1745 m), the highest point on the island, and boasts forests of chestnuts and pines on the north side. Surrounding plains produce grains, vines, figs, and olives. The southern region of the island sits below Mount Ochi (1394 m). The island has substantial mineral wealth as well, including quantities of lignite and magnesite (now being exported), marble and asbestos. The marble (cipollino) of Carystus was widely popular in antiquity, particularly in Rome during the imperial era.

From the 5th century BC bridges across the Euripus have joined Euboea to Boeotia allowing access to the western portion of the island from the mainland. With the exception of the reasonably good port located at Kymi along the rocky east coast, Euboea was most accessible by sea at Chalcis and Eretria, also on the west coast and on the southern tip at Carystus. Important modern ports are still located at Chalcis and Carystus.

Throughout the history of Euboea, environmental and geographic divisions of the island were paralleled by sociopolitical divisions. According to tradition, Euboea was originally settled by people from Thessaly – the Ellopians in the north, the Abantes in the centre and west, and the Dryopes in the south. Each region included, and still includes, a major town. Histiaea-Oreos, the modern village of Orei in the north, is located on the coast. The town was important from the Bronze Age until Classical times when it became known as either Histiaea or Oreos (perhaps an old deme name). Histiaea-Oreos controlled a fairly large and fertile plain and was described by Homer as "rich in vines" (*Iliad*, 2. 537).

Chalcis, in the centre, is located at the narrowest part of the island, facing Boeotia. The town was a trade centre for pottery and metalwork and was important during the Dark Ages. Chalcis flourished despite losing its independence, first to the Athenians, then to the Macedonians, and then to the Romans. Carystus, in the south, is located on the coast below Mount Ochi. On top of Mount Ochi is an example of the famous "dragon houses" of Euboea – ancient structures whose use is unknown. Carystus' importance stems from its control of the southern entrance to the Euripus and of maritime traffic through the Andros straits as well as from its cipollino marble and asbestos. (Still visible in the ancient quarries are abandoned, but worked, columns from the Roman period.) Carystus suffered destruction at the hands of the Persians when its inhabitants were the first to try to oppose the invaders in 490 BC; it later came under Athenian control and may have had an Athenian cleruchy settled there. Near Carystus is Geristos, the site of a sanctuary of Apollo (first mentioned by Homer) and the one safe harbour on the southeast coast of Euboea. It was the first good stopping point for merchant ships travelling from the east and it is possible that this was the main port for Carystus in Classical times.

According to tradition, the original Euboeans were later joined by Ionians from Attica, Aeolians from Phthiotis, and Dorians from the Peloponnese. Because the textual record for the settlement and activities of early Euboea is limited, the site of Lefkandi and its rich material remains play an important role in recreating a picture of Late Bronze-Age and Dark-Age Euboea. At Lefkandi, located between Chalcis and Eretria (explored in 1965–66, 1969–70, and again in the 1980s by the British School at Athens), was found extensive early evidence for occupation from the Early to the Late Helladic and the Geometric periods, and in particular the site sheds light on the transition from the Mycenaean period to the early Dark Age. Of particular historical importance for an understanding of post-Mycenaean economic, social, and architectural developments in Greece is a cemetery found on Toumba hill (about 200 m north of Lefkandi village). At this site is the largest building known from Dark-Age Greece (*c.*1000 BC). It was an apsidal building, about 10 m wide and 45 m long, built of mud brick on top of a stone foundation. There was a double grave in the main room, one grave containing the richly adorned remains of a cremated male warrior and an inhumed woman. The other grave held four inhumed horses. The material remains show clear contact with other areas in the Mediterranean (such as Crete and Attica) and, more surprisingly, the existence of this structure testifies to a much more active economic role for Euboea than had been previously suspected for this early period.

During the 8th century the inhabitants of Chalcis and Eretria were among the first Greeks to found colonies and trading posts on the coasts of Sicily, Italy, Thrace, the islands of the Aegean, and possibly Syria. In fact, at Eretria, mentioned in the Homeric catalogue of ships and located about 18 km south of Chalcis, the earliest physical evidence dates to the Geometric period, when Eretrians established colonies abroad. Currently it is believed that in the late 8th century competition for land and power between these two cities led to the Lelantine War, named after the rich Lelantine plain. The victor in this war is unknown, but the war is reputed to have involved numerous Greek states. Herodotus says that Miletus supported Eretria and Samos supported Chalcis and Thucydides implies that other states were involved, but further details remain stubbornly elusive.

Euboea played an important role in many of the major historical events of the Archaic and Classical periods. For example, Hippias, the former tyrant of Athens, fled there after his expulsion from power. Indeed, after his arrival in Euboea, the Chalcidians allied with Boeotia against Athens, partly in an attempt to restore him. As a result, in 506 BC, the Athenians attacked and defeated the Chalcidians, then took their land for the settlement of 5000 cleruchs. Similarly, the inhabitants of Eretria angered the Persians because of their support of the Ionian revolt, so that in 490 BC the Persians attacked and burned Eretria, and then enslaved the citizens. Off the cape of Artemisium, a promontory on the northwest coast of Euboea, the Greeks and Persians fought one of their first important sea battles in 480 BC. (The statue of Zeus or Poseidon hurling a thunderbolt was also found there and is now located in the National Museum at Athens.)

Euboea joined the Greek forces to defeat the Persians and became a member of the Delian League until 411 BC. However, the Euboeans came to resent Athenian rule and revolted from the league in 446 and in 411 BC. The first revolt was put down by Pericles, who expelled the inhabitants of Histiaea-Oreos and settled at least 1000 cleruchs there (though after the Peloponnesian War the Spartans drove the cleruchs out and

recalled the refugees). The second revolt, probably led by Eretria, was more successful, since the Athenians had been weakened by internal troubles and war with Sparta. Also in 411 the Chalcidians and Boeotians built a bridge over the Euripus, partly to interfere with Athenian maritime trade. Yet, between 378 and 376, due to dramatic changes in the balance of power in Greece, the Athenians induced most Euboean cities voluntarily to join a new maritime league. Thereafter, the populace of Euboea vacillated in their support between the Athenians and the Macedonians.

The Euboean alliance with Athens was not long lived. After the Battle of Leuctra in 371 BC, control of Euboea passed to the Thebans. In 358 the Euboeans were liberated by Chares, who restored the alliance with Athens. In 341 a Euboean confederacy was established, though after the Battle of Chaeronea (338) the island was incorporated under Macedonian control (Philip of Macedon recognized the strategic importance of Euboea and, indeed, claimed that the "master of Euboea is the master of Greece"). Chalcis sheltered at least one important refugee in this period – Aristotle died in Chalcis in 321, at the age of 62, after fleeing there because of persecution by an anti-Macedonian faction in Athens.

Roman interference in Euboean affairs began in earnest during the 2nd century BC. The Romans captured Histiaea in 199 and then in 198 captured and ransacked the city of Eretria, and in 87 BC Eretria was utterly destroyed and deserted. In 194 Euboea, as a whole, was taken from Macedon by the Roman general Flamininus, who briefly restored the Euboean confederacy. In 146 BC Chalcis was nearly destroyed for fighting with Macedon against Rome. The island was next attached to the province of Macedonia, until 27 BC when Greece became the province of Achaea. Though Euboea's political fortunes declined after incorporation into the province of Achaea, the island was still economically viable. Greek lands, including land in Euboea, became an important source of economic power and prestige for Roman elites and archaeological investigations reveal villas and other signs of wealth. Thus, for most of the period under Roman rule, Euboea did not show signs of serious economic decline, at least until early Byzantine times, in part because of its marble and in part because of its favourable position in the trading networks used by the Romans.

The early Byzantine period was one of profound social, religious, political, and economic transitions in the Graeco-Roman world. The now-Christian empire was more clearly divided into eastern and western sections (Euboea was in the east). A series of migrations and invasions from the north, to which Euboea was subject, changed the nature of land use and settlement on the island (people were more likely to cluster in defensible towns than remain on their unprotected rural homesteads). Pagan cult places were replaced with Christian monasteries and churches. During the 7th century AD the territories of the empire began to be reorganized into themes in an attempt to create a better system of defence. The development of the theme system probably had an immediate economic impact, even on Euboea, because local soldier-farmers were allotted lands in return for their military service.

By the end of the 9th century silk was nearly as important to the economy of the provincial Byzantine nobles in Euboea as the quarrying of marble had been in Roman times. During the Second Crusade in 1147, Roger II, king of Sicily, used his army to abduct silk workers from Thebes and Chalcis, because silk was considered so desirable in the west. Mulberry trees, food for silk worms, can still be found in abundance in some areas of the island (especially Carystus).

In 1209 Euboea was divided into the triarchies of Chalcis, Carystus, and Oreos, which were governed by Franks, who ruled from dramatic newly built castles, and who later recognized Venetian overlordship. The Venetians controlled Euboea for more than 200 years. (Above the modern town of Carystus sits Castel Rosso, a well-preserved Venetian fort – named after the reddish colour of its stone.) It was the Venetians who gave the island the name of Negroponte, "Black Bridge", which is a corruption of the Greek *ston Evripo*, "on the Euripus", already changed to *Egripo*, and additionally refers to the bridge (*ponte*) over the Euripus. Since Negroponte ranked as a "kingdom", its flag was one of three raised in St Mark's Square.

When in 1453 the Turks conquered Constantinople, it was only a matter of time before Euboea became part of the new Ottoman empire. So it was in July 1470 that the island fell to the Turks, after a brutal battle at Chalcis led by Sultan Mehmet II. Despite continued fierce resistance in the cities, rural Euboeans may have benefited under the new rule since villagers were no longer serfs (as when they were under the control of Byzantines and Venetians) and could even own property. Agricultural production began to improve as early as the 16th century, although the area around Eretria declined in productive capacity and became swampland until 1824, when a refugee settlement (Nea Psara) was located there. There is now an important regional museum located at Eretria which displays many antiquities including the well-known terracotta centaur of the 10th century BC from Lefkandi.

In the 19th century Euboea was finally released from external rule. Following the Greek War of Independence (1821–30) Greece became the first Balkan state to achieve independence from the Ottomans. Fighting in Euboea appears to have been limited and sporadic, and for three years after most of Greece became independent Euboea remained in Turkish hands. But on 22 February 1833 Euboea was finally declared part of the new Greek state.

The modern island flourishes and is a popular destination for European and Athenian travellers, partly due to its lovely beaches. Modern Carystus, for instance, a town of about 5000 inhabitants, founded after the War of Independence, receives numerous Athenian visitors throughout the summer, ferry services permitting. Many local ancient customs have been preserved, which can be seen in the numerous celebrations held in mountain and coastal villages and at monasteries throughout the year.

CYNTHIA K. KOSSO

Summary

Second largest island in Greece, Euboea was settled by the Neolithic and played a central role in the era of Greek colonization of the 8th and 7th centuries BC. Throughout Classical times it was often controlled by Athens. It remained central to Greek politics well beyond the Classical period because of its location and relative wealth.

Euclid

Mathematician of the 4th–3rd centuries BC

Hardly anything is known about Euclid's life (even in antiquity he was sometimes confused with the Socratic Euclides of Megara); even his dates are uncertain. Proclus (5th century AD) knew only that he was later than the pupils of Plato and earlier than Archimedes (which could be inferred from the surviving works of Euclid and Archimedes, and so probably does not rest on independent evidence). Proclus' guess that he lived in the reign of Ptolemy I Soter (305–282 BC) is a reasonable one, but is based only on anecdotes; his claim that Euclid's goal in pursuing mathematics was to give support to Platonism is certainly no more than an attempt to include the best-known mathematician of the ancient world within Proclus' own school.

A number of mathematical works by Euclid have survived. The *Data* defines and discusses what must be "given" in a geometrical proof; *On Divisions* (surviving only in Arabic) deals with problems about dividing figures into parts that have a given ratio to one another; the *Phaenomena* concerns the astronomical applications of spherical geometry; the *Optics* is on the geometrical aspects of optics. Another work attributed to him, the *Catoptrica*, which deals with the geometry of reflection, seems not to be by Euclid in its present form, but may contain much Euclidean material.

These works establish that Euclid was a substantial creative mathematician in his own right, but there is no doubt that he is most renowned not for this, but for a work that is a compilation and systematization of the work of his predecessors, the *Elements*. Euclid was not the first to compose such a work. The first attempt to compile and systematize geometry appears to have been made by Hippocrates of Chios in the late 5th century BC, and this may have been the basis of much of the earlier books of Euclid's work. It is unclear which (if any) parts of the *Elements* are Euclid's own. He certainly made use of Theaetetus' work on irrationals, and Eudoxus' on the theory of proportion (and he uses extensively the mathematical method devised by Eudoxus and usually called "the method of exhaustion"), and there is clear evidence that other sections of the material incorporated in the *Elements* predate him (for example, Common Notion 3, "if equals are taken from equals, the remainders are equal", is cited by Aristotle in a form very close to that of Euclid's own).

The *Elements* is in 13 books (the alleged 14th, on dodecahedrons and icosahedrons inscribed in a sphere, was written by Hypsicles in the 2nd century BC, and the 15th, on the regular solids, is a compilation of the 6th century AD or later). Book 1 begins with a statement of definitions and of the axioms of mathematics, the unprovable and allegedly self-evident assumptions that are the starting point of mathematical proofs (though even in antiquity some of them, e.g. Postulate 5, were controversial). It then goes on to deal with elementary theorems on triangles, intersecting straight lines, and parallelograms. Book 2 deals specifically with rectangles (the view once held that the theorems in this book constitute a kind of "geometrical algebra", that is a geometrical method of solving quadratic and other equations, is now no longer thought to be probable). The subject of books 4 and 5 is the geometry of the circle and inscribed and circumscribed rectilinear figures. Book 5 is devoted to the theory of proportion; it is probably dependent on the work of Eudoxus, and constitutes one of the most sophisticated and elegant surviving pieces of Greek mathematics. In book 6 the conclusions of book 5 are applied to plane geometry. Books 7, 8, and 9 are on number theory, and book 10 deals with irrationals. Finally, books 11, 12, and 13 deal with solid geometry, with a series of propositions parallel to those on plane geometry in the early books. Though the individual sections are impressive in isolation, Euclid's real achievement is to bring together a mass of mathematical material and to articulate it into a coherent and ordered system, based on the minimum of axioms.

Euclid's *Elements* subsequently became the basis of all mathematical education, not only in the Roman and Byzantine periods, but right down to the mid-20th century, and it could be argued that it is the most successful textbook ever written. His clear and logical exposition of mathematics facilitated the process by which geometry became an essential part of the educational syllabus, and a familiarity with its principles an indispensable accomplishment for every educated man. Certainly it helped to establish mathematics as one of the foundations of Hellenic culture, and the discovery of formal proof as one of Greece's most valuable and enduring legacies. A series of commentaries on the *Elements* demonstrates its continuing importance. The most important of them (on book 1) was written by Proclus in the 5th century AD. Proclus was primarily a philosopher rather than a mathematician, and his commentary stresses the significance of Euclid's geometry for Neoplatonism. Though the work was undoubtedly designed for students of philosophy who were beginners in mathematics (and may have been based on a series of lectures given by Proclus), there are signs that a general readership was also

envisaged, which, if true, would be evidence of a continuing interest in Euclid's work among a wider educated public.

Like most school textbooks, the *Elements* was adapted by teachers to fit their own needs, and before the 19th century the text universally used was not Euclid's own, but an adaptation of it devised by Theon of Alexandria in the late 4th century AD. Theon corrected what he believed (often wrongly) to be errors in Euclid's mathematics, tidied up his diction, and introduced material (including whole propositions) with the intention of making the argument clearer. There are signs that some of the additions were not Theon's own, but were taken over from earlier adapted texts. It was only with the edition of F. Peyrard, completed in 1818 (and made possible by Napoleon's looting of manuscripts from Italian libraries), that a good text close to Euclid's own was made available. The *Elements* was first translated into modern Greek in 1820.

Biography

The most famous Greek mathematician, even though almost nothing is known about his life. He may have lived in the reign of Ptolemy I (305–282 BC) in Alexandria. Surviving mathematical works include the *Data*, *On Divisions*, *Phaenomena*, *Optics*, and *Catoptrica*. His best-known work is undoubtedly the *Elements* in 13 books. It remained the standard textbook of geometry for 2000 years.

Eudoxus *c.*390–*c.*340 BC

Mathematician and astronomer

Though he is reported to have taught at Cyzicus and studied in Egypt, most of Eudoxus' activity is associated with Plato's Academy in Athens, where he was working in the middle of the 4th century BC. None of his writings survives, and so we must reconstruct his work through reports in later writers. He was clearly a man of very broad interests. Aristotle (*Nicomachaean Ethics*, 10. 1172b) reports that in ethics he held that the supreme good is pleasure, on the grounds that pleasure is what all creatures desire; Aristotle remarks that his view attracted support, not from the cogency of the argument, but because of Eudoxus' own reputation for moral rectitude. He is also said to have done work in geography, and to have written a code of laws for his home city Cnidus.

Eudoxus is, however, best known for his work in astronomy. He did a good deal of detailed observational work. He appears to have been influential in marking the sun's annual movement in terms of the 12 signs of the zodiac, and to have introduced the practice of identifying individual stars in constellations by letters of the alphabet. He is the first Greek astronomer of whom we can say with reasonable certainty that he had access to the ancient astronomical knowledge of the Babylonians (though his supposed study in Egypt left no discernible trace); for example, in the placing of the solstitial and equinoctial points in the middle of the appropriate signs of the zodiac (rather than at the beginning), and in equalizing the lengths of the seasons, he is following Babylonian rather than standard Greek practice. His main contribution, however, was to apply contemporary mathematics, and particularly the geometry of the circle and the sphere, to astronomical problems. Both the fixed stars and the sun seem to move round the earth in circular orbits on the surface of a sphere. The moon and the planets, however, appear to move in much more complex ways (indeed the planets sometimes appear to move backwards). Eudoxus' system is an attempt to explain these movements mathematically in terms of combinations of circular orbits, the axes of which were not fixed but rotated around different axes – or, in other words, complex arrangements of concentric spheres. He believed that the movements of the moon and the sun could be explained by using three such spheres for each body, while the five visible planets needed four each, making, with the sphere of the fixed stars, 27 in all. The apparent retrograde movement of the planets is accounted for by having their third and fourth spheres rotate in opposite directions to one another, and around axes at an angle to one another, which produces movement in something like a figure-of-eight; Simplicius tell us that Eudoxus called this figure a *hippopede* (horse-fetter). Despite the mathematical sophistication of this system, it failed to account even for those movements that were well known to astronomers of his time (perhaps the most striking example being the inequality of the seasons). It soon had to be modified (and complicated) by Callipus of Cyzicus, a version of whose system was the one used by Aristotle, and it was later superseded by the more accurate systems of Eratosthenes, Hipparchus, and Ptolemy. Nevertheless, Eudoxus was the first to make a serious attempt to create a mathematical model of the movement of the heavenly bodies, and so can claim to be one of the founders of scientific astronomy. His system was an entirely mathematical one, and he made no suggestion that we know of as to the mechanism whereby the mathematics could be converted into actual moving bodies.

Important though his astronomical work is, however, there is no doubt that it was his contribution to mathematics that had the most permanent and creative influence. He is said to have been largely responsible for the material on proportion contained in book 5 of Euclid's *Elements*. He is credited with the discovery of a method of handling both commensurable and incommensurable magnitudes, which meant that it became possible to simplify and clarify proofs in a number of important areas, and opened up the way for significant new developments in geometry. Eudoxus seems also to been responsible for one of the most powerful and characteristic strategies for proof in Greek mathematics, the so-called "method of exhaus-

tion". The name by which it is now generally known is seriously misleading. It is used to relate the areas or volumes of figures bounded by curves to those of figures bounded by straight lines, and its purpose is to avoid the difficulties posed by infinite division; for example, although a polygon can be inscribed in a circle as closely as you like to the circumference of the circle, it can never be inscribed so closely that another polygon cannot be inscribed between the first polygon and the circumference of the circle, and the space separating the two can never be entirely exhausted. Eudoxus' method avoids this problem by proving that, for example, a given polygon encloses an area that can be neither bigger nor smaller than that enclosed by a given circle, and so must be equal to it. This ingenious strategy enabled the solution of many problems (including those arising from attempts to square the circle) and is the basis of much of the geometry of Euclid and Archimedes.

RICHARD WALLACE

Biography

Born *c.*390 BC at Cnidus, Eudoxus was taught geometry by Archytas and medicine by Philistion. He is said also to have visited Egypt, Cyzicus, and Halicarnassus before settling in Athens to teach, where he was acquainted with Plato. None of his writings survive, but he made important contributions to mathematics and astronomy. He died *c.*340 BC.

Eunuchs

"Eunuchs" may seem at first sight a jarring entry in an encyclopaedia of Greece and the Hellenic tradition, for eunuchs are primarily associated with the Orient. Indeed the Greeks of the Classical world linked them especially with Persia, where court eunuchs were prevalent, as on the Assyrian model. Herodotus alludes casually to the eunuchs to be found at the Persian court, but also to those in Median and Egyptian circles; in the *Acharnians* (91–122) Aristophanes has the Great King's Eye report to the Athenian assembly, flanked by two eunuchs; famously, Xenophon in his *Cyropaedia* presents an elaborate justification of the use of eunuchs by king Cyrus; while Ctesias' *Persica* is full of tales concerning eunuchs at the Persian court.

Yet eunuchs and castration did have a closer proximity to the Greeks. Castration was as much a part of Greek mythology as that of other Near Eastern religions. Hesiod in his *Theogony* (178–200) describes the castration of Uranus' genitals with a sickle by Cronus, the blood from which was received by Earth who bore the Erinyes, the Giants, and the Meliae nymphs. The genitals themselves were thrown into the sea, from which grew Aphrodite. The effect of the castration of Uranus was disempowerment, and he was replaced by his son Cronus as the supreme deity. Castration also found a place in Greek epics (e.g. the mutilation of Melanthius in the *Odyssey*, 22. 474–77). In the real world, eunuch priests had their part to play in the Anatolian cults of goddesses, notably that of Cybele.

It is clear that eunuchs also impinged more directly on the Greek world. Herodotus records that Periander the tyrant of Corinth sent 330 boys of the leading families in Corcyra (modern Corfu) to the Lydian king Alyattes at Sardis to be castrated, though the people of Samos saved them. Perhaps more reliably, Herodotus states that during the Ionian revolt the Persians threatened to eunuchize Ionian boys, a threat which the historian says came to pass. Herodotus also relates the history of Hermotimus (the most favoured of Xerxes's eunuchs) who came originally from Pedasus east of Halicarnassus. He was bought as a prisoner of war by a Chian, Panionius, who castrated him as part of his regular trade in eunuchs, whom he would sell at Sardis and Ephesus. Plato even asserts that Callias, a wealthy Athenian in late 5th-century BC Athens, had a eunuch doorkeeper, though it is vital to remember that Plato was writing a century later. Other evidence for eunuch slaves in Athens is found in Terence's *Eunuch*, which was based on a work of the Athenian playwright Menander; in the extant Roman version the plot revolves around the fact that an Athenian woman has a eunuch slave whose place is taken by an uncastrated male so that he can gain access to the house and seduce a girl. In the 4th century BC Aristotle certainly seems very familiar with eunuch physiognomy, discussing for instance their impotency, gender status, and voice, though his knowledge may be based on the Hippocratic corpus (itself problematic) rather than on personal observation.

With the advent of Alexander the Great, the Greek world came into even closer contact with the tradition of political eunuchism. For when Alexander conquered the Persian empire he did not simply replace it with an extension of the Macedonian kingdom, but sought to present himself as the legitimate ruler of Persia. This entailed his adoption of the Persian royal style and its trappings, including the use of court eunuchs. In all the subsequent Hellenistic kingdoms (with the exception of Macedonia, which maintained its character undiluted) eunuchs are to be found. It is well known that the decision to murder Pompey after his flight to Ptolemaic Egypt following his defeat in the civil war with Julius Caesar was primarily encouraged by the eunuch Potheinus, a key figure in the regency of Ptolemy XIII. Eunuchs feature prominently in the stories of Mithridates VI, king of Pontus. A more unusual case marks the principality of Pergamum; the establishing figure of this was Philetaerus, said to have been eunuchized as a child when crushed in a crowd at a funeral.

With the shift of power in the Mediterranean to Rome, Greek political power took a back seat, but the Hellenistic court style, based on the Persian model, eventually triumphed at the Roman court of late antiquity; as a result of this eunuchs are a striking feature of the history of the later Roman empire. This development is associated primarily with Diocletian (284–305), who seems to have enhanced imperial status and

ceremony to promote the authority and security of the emperor.

The phenomenon of the court eunuch, introduced to the Roman empire in late antiquity, reached an apogee in the Byzantine empire. One of the curiosities of the Byzantine system was, however, the internal production of eunuchs. Rome had expressed vehemently again and again that no Romans themselves were to be made eunuchs, or indeed that castration was not to occur within the empire, preferring to rely on the importing of foreign eunuchs, but in Byzantium there is clear evidence for the internal production of eunuchs. The 10th-century Arab historian Masudi states baldly that the Byzantines, like the Chinese, practised the castrating of their own children, while a hagiographical anecdote points to Paphlagonia as a region particularly given to the production of eunuchs. This latter story seems to find confirmation in the appearance in middle Byzantine history of a large number of Paphlagonian eunuchs, such as Constantine, Bringas, and John the Orphanotrophos. Undoubtedly this fact was due to the high demand for eunuchs at the imperial court, but also the high rewards that could be achieved. Another striking feature of Byzantine eunuchs, however, is the existence of a substantial group as free individuals, beyond imperial service. Eunuchs are met as actors, teachers, prostitutes, singers, monks, and clergy; some even became patriarch of Constantinople. In the case of Ignatios (patriarch from 847 to 858 and again from 867 to 878), he owed his eunuch state to the fact of his castration as a youth which was carried out to block him from imperial power, for he was a son of the deposed emperor Michael I (811–13).

Castration seems to have been a more general form of punishment also – rapists and homosexuals could expect to be castrated. There is no doubt then that in Byzantine times castration and eunuchs were a full part of the Hellenic tradition, but one that did not remain uncontroversial. Indeed, in the 12th century Theophylact of Ohrid wrote a defence of eunuchs, at the instigation of his eunuch brother.

A decline in the phenomenon of powerful court eunuchs occurs from the 11th century onwards, and is variously linked with the establishment of the aristocratic regime of the Komnenoi, the disaster of 1204, and the westernization of Byzantine society. Yet it seems that the general presence of eunuchs continued, and the system certainly provided a stimulus, if not a model, for the succeeding Ottoman empire. Here, this striking aspect of the Hellenic tradition continued to flourish.

Euripides *c.*480–c.407/06 BC

Tragedian

Euripides spent the last two years of his life as a guest of Archelaus in Macedonia. He won his first victory in 441 BC and three others in his lifetime (including one with the trilogy that contained *Hippolytus* in 428 BC, and an additional one for the posthumous performances of *Iphigenia in Aulis* and *Bacchae* in 405 BC). Although he later became the most popular Greek tragedian, in his own lifetime Euripedes was less successful than Aeschylus and Sophocles.

Nineteen of his plays, out of some 90, survive (one of which, *Rhesus*, is probably by a later poet), including our only complete satyr play, *Cyclops*. In addition to the ten plays that survive because they were the most commonly read in the Hellenistic and Roman periods, a further nine survive through a lucky accident: they were preserved in a manuscript that presents them in a quasi-alphabetical order (they evidently formed one part of a collection representing *The Complete Euripides*). In addition, there are extended fragments of the *Antiope*, *Alexander*, *Archelaus*, *Bellerophon*, *Cresphontes*, *Cretans*, *Erechtheus*, *Hypsipyle*, *Captive Melanippe*, *Wise Melanippe*, *Phaethon*, and *Stheneboea*.

The dates of performance for nine of Euripides' surviving plays are known, and others are tentatively proposed on the basis of evidence provided by the scholia or other writers or of his own developing metrical practice: *Alcestis* (*c.*438 BC), *Medea* (*c.*431), *Heraclidae* (*c.*430), *Hippolytus* (*c.*428), *Andromache* (*c.*425), *Hecuba* (*c.*424), *Suppliant Women* (*c.*424–420), *Electra* (*c.*422–416), *Troades* (*c.*415), *Heracles* (*c.*415), *Iphigeneia among the Taurians* (*c.*414), *Ion* (*c.*413), *Helen* (*c.*412), *Phoenissae* (*c.*409), *Orestes* (*c.*408), *Cyclops* (uncertain), *Iphigeneia at Aulis* (*c.*405, posthumous), *Bacchae* (*c.*405, posthumous), and *Rhesus* (possibly post-Euripidean).

Euripides has been called the first psychological playwright. Longinus praised his depiction of madness and love (*On the Sublime*, 15. 3). Aristotle says that Sophocles claimed that he depicted men as they ought to be and Euripides as they were (*Poetics*, 1460b33ff.). Whereas in Aeschylus god confronts god, and in Sophocles man confronts god, in Euripides man confronts man, or woman, and often himself or herself. Only Medea can stop Medea: her main debate is with herself. In the works of other playwrights the traditional heroes are endorsed; Euripides focuses instead on women, children, and slaves. He shows us women doing noble acts (e.g. Iphigeneia, Macaria), children acting nobly (both characters just mentioned, and Menoeceus in *Phoenissae*), and the figure of the noble slave (e.g. in *Helen*).

Euripides questions traditional beliefs and attitudes, and his plays feature debates that were also popular among the Sophists of his time. In these debates both strong emotions and strong intellectual positions are expressed; examples are Hippolytus' confrontation with Theseus (*Hippolytus*) and Hecuba's with Helen (*Trojan Women*). This bothered many critics in the 19th century who would have preferred inspired emotionalism without philosophical debate (see Nietzsche's condemnation of Euripides for just this rationality, which he considered a debasement of the noble goals of tragedy).

Aristophanes' *Frogs*, which highlights a contest between Aeschylus and Euripides, shows the latter as an innovator and an iconoclast. It is from Aristophanes that we get the dubious impression that Euripides was a misogynist. He was instead a scientist of the emotions and focused on unconventional, passionate women. It may have been his idea to have Medea kill her children, the ultimate revenge against the husband she hated. His psychological characterization is outstanding; he gave the first instance of a guilty conscience (*Orestes*, 395–96), described as an internal disease rather than an externally imposed punishment as we find in Aeschylus and Sophocles.

Euripides' language is accessible, and at times colloquial. His structure varied from the most organized and conventional (*Bacchae*, *Iphigeneia among the Taurians*) to loose and episodic (*Trojan Women*, *Iphigeneia at Aulis*). He specialized in arias to enhance emotional states; he also excelled in debate (*agon*) as a revelation of character. His choruses can range from being integrated with the plot, to the less relevant. This may reflect a trend of the time.

There were regular revivals of Euripides' work after 386 BC. Around 330 BC the Athenian politician Lycurgus prescribed that copies of the texts of the plays should be deposited in the official archives, and that future performances should conform to these texts. The purpose was to safeguard the plays from adaptation and interpolation by actors and producers, of a kind to which they had already become vulnerable. These copies were lent to the Egyptian king Ptolemy I Euergetes, and will have passed into the Library at Alexandria, to form the basis of the critical edition made by the librarian Aristophanes of Byzantium (*c.*257–180 BC). Aristophanes divided the lyrics (previously written as continuous prose) into metrical cola. He also added brief introductory comments, probably making use of Aristotle's lost *Didaskaliai* (production records). Part of these comments survive in the *hypotheses* (plot summaries) that were prefixed to the plays by later scholars in the Roman period. The composition of commentaries (scholia) on the plays was began in the Hellenistic period (by scholars such as Aristarchus of Samothrace, ?217–145 BC, and Didymus, ?80–10 BC). Further scholia were added in the Byzantine period.

The Romans prized Euripides, and Ennius (239–169 BC) wrote adaptations: *Andromacha*, *Hecuba*, *Iphigenia*, and *Medea*; Pacuvius (*c.* 220–130 BC), *Antiopa*; and Accius (170–?86 BC) *Alcestis*, *Bacchae*, *Hecuba*, *Medea*, and *Troaïdes*. Half of the plays by Seneca (?AD 1–65) are from Euripides: *Hercules* [*Furens*], *Troades*, *Phoenissae*, *Medea*, and *Phaedra*.

The selection of the ten "school edition" plays that we possess was probably done in the 2nd or 3rd century AD, and scholia were included. After parchment gradually replaced papyrus (around the 4th century AD) the unselected plays gradually passed out of use. Stobaeus' anthology (5th century) of gnomic sayings often quotes lines from Euripides, including many from the lost plays. After the Athenian Academy was closed in AD 529, the Classical texts disappeared from sight for several centuries and did not re-emerge until the revival of learning in the middle Byzantine period, when they were copied from the uncial into the new cursive script. Among the scholars who wrote commentaries and handled the texts of the plays the most important are Thomas Magister (late 13th century), Manuel Moschopoulos (*fl.*1300), and Demetrios Triklinios (early 14th century). Triklinios brought a new metrical awareness to the amendment of the text, in particular the lyrics.

The nine alphabetical plays mentioned above are preserved only in two 14th-century manuscripts, L and its copy P. The earliest manuscript is the Jerusalem palimpsest from the 10th or 11th century and it includes the school selection. The Euripidean plays most commonly read in Byzantine times were *Hecuba*, *Phoenissae*, and *Orestes*. *Christus Patiens* was a play written in the 11th or 12th century on the passion of Christ using lines from Euripides, Aeschylus, and Lycophron, and some of the ending of the *Bacchae* has been reconstructed from it.

Medea, *Hippolytus*, *Alcestis*, and *Andromache* were first printed in Florence about 1494; an edition of 18 plays followed in 1503; *Electra* was not published until 1546. For the next 400 years there were revivals and reworkings of Euripides' plays in Europe, most notably by Racine, Goethe, Schlegel, and many others. In the 20th century Euripides is the playwright of social protest par excellence.

There have been many performances of Euripides' plays in modern times in Greece. A few of the most notable are: *Alcestis* in 1901 (music by Gluck, direction and translation by Constantinos Christomanos) and 1934 (Karolos Koun, director, and set by Giannis Tsarouchis); since 1868 *Medea*: 1942 (Takis Mouzenidis, director, music by Manos Hazidakis), 1956 (Alexis Minotis, director, music by Hadzidakis, starring Katina Paxinou), and 1989 (Aspasia Papathanasiou, director and star); *Hippolytus* since 1897: in 1937 (Dimitris Rondiris, director, Dimitris Mitropoulos, Alexis Minotis as Hippolytus, and Katina Paxinou as Phaedra) and 1965 (Dimitris Rondiris, director, music by Dimitris Mitropoulos; Aspasia Papathanasiou as Phaedra); *Bacchae* was notably done in 1962 (Alexis Minotis, director, music by Hadzidakis, Alexis Minotis as Kadmos, Basilis Kanakis as Pentheus, Katina Paxinou as

Agave), 1977 (Karolos Koun, director), and 1986–88 (Theodoros Terzopoulos, director, with his Attis theatre). Mikis Theodorakis's opera *Medea* (1991) is a parable of the history of Greece.

There are many films based on Euripides; Cacoyannis's *Trojan Trilogy* is based entirely on his work, with *Electra* (1961), *Trojan Women* (1971), and *Iphigeneia* (1976), all protesting in their own way against unjust oppression; Mikis Theodorakis composed the music for these films. Jules Dassin filmed *Phaedra* (1962) with a social message, contrasting the mass tragedy of loyal workers with the personal tragedy of dissolute jet-setters; he also based his *Dream of Passion* (1978) on *Medea*. Pasolini's *Medea* (1967) dealt with the myth behind the play in psychological and anthropological terms.

Biography

Born *c.*480 BC in Phyla, Euripides moved to Athens in childhood and first competed in the city Dionysia in 455 BC, winning his first victory in 441. He won four other victories (including one posthumously in 405). Of about 90 plays written, 19 survive (one of them spurious), including our only complete satyr play. He was less successful than Aeschylus and Sophocles in his lifetime but more popular than them later. He died in Macedon *c.*407/06 BC.

European Community and European Union

On 1 January 1981 Greece became a full member of the European Community (EC), which metamorphosed into the European Union (EU) when the Maastricht Treaty came into force on 1 November 1993. Greece was thus a "second generation" EC member. However, as the first state to apply for an Association with the European Economic Community, Greece had participated in the economic integration process from the early years.

The EEC, founded in 1957 by West Germany, France, Italy, the Netherlands, Belgium, and Luxembourg, initially entailed the creation of a common market based on the "Four Freedoms" – freedom of movement of goods, capital, labour, and services – plus a Common Agricultural Policy (CAP). From an economic viewpoint, the Greek application to the EEC on 8 June 1959 can be seen as the logical extension of the switch to an export-led development strategy adopted in 1953. By the end of the 1950s the EEC-6 already constituted the main outlet for Greek exports (over 30 per cent), and association facilitated access to Community markets. However, the motivation of Constantine Karamanlis's National Radical Union (ERE) government also appears to have been political, with the aim of consolidating Greece's links with its west European allies during a period of Cold War. Like European integration itself – which can be summed up as the quest by west European states to achieve "ever closer union" politically via an economic route – the Greek association pursued political ends through economic means.

Official negotiations began in March 1960, culminating with the signature of the Athens Agreement on 9 July 1961 and its coming into effect on 1 November 1962. The basis of the association was a customs union between Greece and the EEC-6, to be completed over a 22-year period ending in 1984. Reflecting the disparity in economic development levels, the dismantling of tariff barriers was to take place more rapidly on the EEC side, so that Greek products would gain access to European markets before the domestic economy opened up fully to foreign competition. Clauses not subsequently implemented provided for free movement of labour and the progressive harmonization of Greek agricultural policy with the CAP. A financial protocol attached to the association offered $125 million in subsidized development loans from the European Investment Bank – a significant recognition of the EEC's responsibility to support the economic development of its weaker partner. The association also declared that, when Greece could assume all the obligations of full membership, the contracting parties should "consider the possibility" of accession. While hardly a binding legal commitment, this can be regarded as a clear indication of intent by both parties. Thus, the association acknowledged this developing country, with a per capita GDP around 40 per cent of the EC average, as a potential full participant in the influential Community club.

This prospect seemed to be threatened when the military coup of 21 April 1967 resulted in the EC limiting the association to its "routine administration". While tariff dismantling continued on schedule, agricultural harmonization talks were suspended, free movement of labour was not implemented, financial aid was frozen, and political contacts significantly reduced. The unbalanced functioning of the association continued following the junta's fall in July 1974. Although the association was formally reactivated five months later, the EC declined to discuss free movement or agricultural harmonization, while agreement on the Second Financial Protocol required tough negotiation.

Greece's relative marginalization coincided with a rapid advance in European integration. In 1968 the EEC merged its institutions with those of the European Coal and Steel Community (founded in 1952) and the European Atomic Energy Commission (1957) to form the European Communities or, more simply, Community. In the early 1970s the EC expanded from six to nine members with the accession of the United Kingdom, Ireland, and Denmark; made an explicit move from the economic to the political sphere with the first timid steps towards foreign policy coordination (European Political Cooperation – EPC); and embarked on an ill-fated first attempt at Economic and Monetary Union (EMU).

The EC's rapid development, combined with the unbalanced functioning of the association, made full membership desirable sooner rather than later. The official application was submitted on 12 June 1975. Karamanlis's New Democracy government hoped accession would consolidate domestic democracy and enhance national security vis-à-vis Turkey, while regarding the challenge of the EC market combined with CAP support as an optimum framework for economic development. In the aftermath of the Turkish invasion of Cyprus and temporary Greek withdrawal from NATO's military wing, EC membership was also expected to restabilize Greece's links with its western allies, while simultaneously permitting the adjustment of the postwar patron–client relationship with the United States. On a symbolic level, Karamanlis's description of accession as Greece's "new *Megali Idea*" defined EC entry as the route to national regeneration – to be achieved, not through the pre-1922 dream of territorial expansion, but by Greece's transformation into a modern state in the contemporary European mould.

Accession was a controversial policy choice. Advocated by the right-wing New Democracy, the Centre, and (rather more critically) by the small Eurocommunist party (KKE-Esoterikou), it was adamantly opposed by the Panhellenic Socialist Movement (PASOK) and the orthodox Communist Party (KKE). While the two anti-EC parties promoted different

alternatives – closer economic links with the Third World in the case of PASOK compared to the KKE's support for increased trade with the eastern bloc – their analyses of the EC were remarkably similar. Both parties regarded the Community as an imperialist creation and warned that accession would result in economic subordination to multinational monopolies, the distortion of democracy, and the betrayal of national foreign policy interests. While the dispute was clearly shaped by Cold War dynamics, on another level it represented a new phase in the long-running debate about Greece's cultural identity and relationship to Europe. The EC's supporters saw "Europeanization" and "modernization" as both synonymous and desirable, and regarded accession as a homecoming to the area where Greece rightfully belonged. In contrast, its opponents, continuing a tradition which viewed western Europe as an alien region inimical to Hellenism, warned that Greek culture was endangered by accession. On occasion, there appeared to be a curious convergence of views between the two anti-EC left-wing parties and Church circles which feared entry to the "Catholic" EC threatened the spiritual values of Orthodoxy.

The path to accession was not especially smooth. The European Commission's initial proposal for an extended pre-entry period was rejected by the Council of Ministers. But the negotiations, which formally opened in July 1976, were then threatened by the 1977 Spanish and Portuguese membership applications. The subsequent threat of "globalized" entry talks, delaying Greek admission, was apparently averted by the dynamic personal diplomacy of prime minister Karamanlis. He was clearly assisted by west European concerns to reestablish unity on NATO's southeastern flank and to ensure Greek accession before the election of an anti-Western government. The membership treaty, signed on 28 May 1979, included a five-year transitional period before the full application of the CAP (extended to seven years for certain products, including peaches and tomato paste, and seven years for free movement of labour). Opposition claims that Greek entry occurred on particularly onerous terms later seemed to be disproved when Spain and Portugal finally entered the EC five years later than Greece and with longer transition periods.

Despite 18 years of association, neither the economy nor the administration was well prepared for accession. The government's strategy appeared to be summed up by Karamanlis's famous remark to the Greek industrialists, that he was throwing them into the sea, confident that they would learn how to swim. Nor did PASOK's electoral victory ten months after Greek accession facilitate adjustment to membership. In particular, the party's first term in office (1981–85) saw intense ideological conflicts in the field of foreign-policy cooperation, frequent attempts to delay economic integration by seeking postponements and exceptions from EC rules, and adamant opposition to proposals for deeper political integration. A formal request for a special status, made in the Greek Government Memorandum of 1982, was rejected by the EC. However, the Community's offer of substantial funding through the Integrated Mediterranean Programmes provided the justification for a subsequent change of heart. In 1985, after a period of prevarication, prime minister Andreas Papandreou, claiming that PASOK had improved the terms of participation, announced that Greece was in the Community to stay.

Subsequently, PASOK moved towards an increasingly pro-European stance. Public opinion was already convinced: from the mid-1980s polls showed clear pro-EC majorities. By the 1990s opposition to integration was no longer a mainstream political position. But by this time Greece had acquired an unflattering image among its partners, owing to its weak economic performance, foreign policy incompatibilities, and generally non-*Communautaire* stance. This picture only began to change during the premiership of Kostas Simitis after 1996.

Meanwhile, after the mid-1980s, the EC had acquired a new momentum: expanding from 10 to 12 and then 15 members; moving from the customs union to the single market and subsequently to EMU; enhancing supranational decision-making; and acquiring an explicitly political content with the adoption of the Common Foreign and Security Policy (CFSP) and Justice and Home Affairs Cooperation as the two new "pillars" of European Union alongside the existing economic Community. Membership of the current EU clearly has more far-reaching implications than the more limited Community which Greece initially joined. Over a historically brief period, accession has already had a deep and wide-ranging impact on Greece's economy, international standing, and domestic political system, which can only be schematically indicated here.

For instance, participation in the customs union has encouraged trade reorientation towards the EU, which by the 1990s accounted for over 60 per cent of both imports and exports. A growing trade deficit has been accompanied by the decline of industry's share in GDP. Increasing import penetration has stimulated significant lifestyle changes, including a startling growth in consumerism. For example, the rapid rise in meat imports, of which the EC accounted for almost 90 per cent by 1985, has been a notable factor in altered eating habits. On the other hand, it could be argued that such change was inevitable anyway, while EU membership provides some defence against the ubiquitous effects of globalization.

Membership has also promoted economic liberalization, encouraged by the single market programme and reinforced by the drive to meet the strict entry criteria for EMU. The consequences include the ending of state monopolies in many sectors, ranging from air transport and telecommunications to match production, and the stimulation of economic restructuring, e.g. in the banking sector. The overall effect has been a significant erosion of the Greek state's previously dominant economic role, upgrading the importance of market forces.

Net transfers from the EC/EU budget grew from 0.5 per cent of GDP in 1981 to over 6 per cent by the late 1990s. The lion's share (around 60 per cent) came from the CAP, accounting for over 35 per cent of national agricultural product by the late 1990s. This brought a visible new prosperity to the Greek countryside, narrowing the urban–rural divide in living standards; the CAP and tourism together stemmed the tide of the postwar rural population exodus. Meanwhile, by the mid-1990s, the Structural Funds (Regional, Social, and Agricultural Guidance) provided about one-third of total public investment. The Greek state's regional development policy, almost in its entirety, is now conducted in partnership with the EU. Sadly,

the inflow of funding has failed to achieve real economic convergence: Greek GDP per capita as a proportion of the EC/EU average has actually declined since 1981.

Participation in EPC/CFSP has brought closer foreign-policy alignment with the EU partners. A prime example was diplomatic recognition of Israel, overturning Greece's previously pro-Arab stance. Traditionally an object rather than a subject of international power politics, Greece has acquired a greater voice in global affairs through its ability to influence EC/EU policy. Membership has also provided a powerful weapon in bilateral relations with the Balkan neighbours; this proved controversial when used to block international recognition of the Former Yugoslav Republic of Macedonia or EU financial aid to Turkey.

The implications of European integration for national sovereignty and democracy remain a topic of heated debate; but they are clearly not the same for Greece as for the former imperial powers. Since independence in 1830 Greece, as a small, weak state occupying a strategic position, was frequently an object of Great Power intervention, often with unsettling effects on domestic democracy. Membership of western Europe's most powerful club helped to break the pattern of dependence on foreign patrons, providing a stable framework for consolidation of the post-1974 democracy. While the transfer of legislative responsibilities to "Brussels" has undermined the role of the Greek parliament, the latter was traditionally weak anyway. Although not one of the more powerful players, within EU institutions Greece is now a policy-making participant with some decision-making influence.

Meanwhile, it has been argued that integration may be producing a more diffuse power distribution among different levels of government: for example, by effecting shifts in centre-periphery relations. Thus, EC/EU structural policy has broadened the horizons of Greek local government, and necessitated the creation of administrative regions as the basic units for EC/EU-funded programmes.

Despite entrenched resistance, "Europeanization", in the sense of the internalization of values, norms, and practices prevalent within the EU, is increasingly apparent throughout the political system. Examples range from the ideological and programmatic convergence of Greek political parties with their west European counterparts, to the introduction of new principles of planning and monitoring public works projects in response to the rules of EU-funded programmes. Meanwhile, public policymaking is increasingly driven by the constraints and opportunities of EU membership. For example, Greek environmental policy – still in a rudimentary phase at the time of accession – has essentially taken shape under the twin stimuli of the EU's legislative framework and financial inputs.

Thus, after two decades of Association and two of full membership, the European Union has essentially become the focal reference point for Greek economics, politics, and international identity. The extent and range of future EU influence will depend not only on how the Union itself evolves, but also on how well Greece responds to the continuing challenge of European integration.

Eusebius *c.*AD 260–339

Ecclesiastical historian

In his native Caesarea Eusebius was a pupil of the great Origenist Pamphilus, whose martyrdom he celebrates in his *Ecclesiastical History*, and whose name he honoured by adding it to his own. Like Pamphilus he admired both the theology and the scholarship of Origen, whose library must have furnished him with materials for his apologetic work, the *Preparation of the Gospel*. Written after AD 313, this was in response to the Neoplatonist Porphyry, who had written a damaging work against Christianity. The *Preparation*, far excelling both Origen and Pamphilus in its knowledge of and sympathy with Greek literature, remains our most abundant source of passages from the authors whom we now call Middle Platonist. With his monograph *Against Hierocles* (*c.*300) Eusebius refuted another disputant, who had argued that the miracles attributed to the pagan saint Apollonius of Tyana were both holier and greater than those of Christ. He completed his apologetic task with the *Demonstration of the Gospel*, which set out what he understood as the elements of theology, supporting them from scripture and drawing the first of many illegitimate comparisons between the Christian Trinity and the "three hypostases" (One, Mind, Soul) of Neoplatonism.

The most original of Eusebius' many talents were devoted to historical inquiry, which invariably led to the discernment of God's providential will in the affairs of his chosen people(s). More serviceable to later generations than his commentaries on Luke and Matthew were his *Onomasticon*, a glossary of the Hebrew names in scripture, and his (lost) *Chronicle*, which in Jerome's Latin adaptation supplies the modern historian with many of his dates. Eusebius' reckoning is by Olympiads, since his object was to match the biblical record with the events of secular history; in this, as in his concordance of the gospels, his success was not so great as he supposed. His most important labour was the *Ecclesiastical History*, the first seven books of which may have been complete before the persecution of Diocletian in 303. Taking the fall of Jerusalem in AD 70 as a proof that Christianity had supplanted Israel in the plan of God, he reckoned up the bishops of all the major sees, alluded to works by previous apologists, commemorated the lives of outstanding churchmen, and showed how the integrity of both scripture and the episcopate had been maintained against the assaults of heresy. His practice of quoting written sources, typical of Greek oratory but not of historiography, is a further indication of his apologetic motive. But if his purpose was (as one suspects) to be the Josephus of the Church and win the Romans to his party, he was undeceived by the years of persecution (303–13) which he recounts in his last three books and in the associated history of the Palestinian martyrs. The final version of these, however, was published after the Christian warlord Constantine assumed the throne of a united empire in 324, and Eusebius saw his reign as the consummation of God's purpose in the world.

He now had the opportunity to set out his optimistic view of history more fully in the second of his two *Theophanies*, which treats the supersession of the Jews as an accomplished fact and predicts an imminent judgement of the world. In his *Tricennalian Oration* of 336 he endows his sovereign with a benevolence, perspicacity, and promptitude of action scarcely inferior to those of the Almighty. The *Life of Constantine*, more a panegyric than a biography, was finished after its hero's death in 337, and credits him with a thoroughgoing policy for the conversion of the empire, which he never executed and may never have entertained. This work also preserves an embellished narrative of Constantine's conversion and the fifth book is an appendix that contains the emperor's one surviving sermon, the *Oration to the Assembly of the Saints.*

That this work is not a forgery by Eusebius is clear from several passages that contradict the teaching of the theological treatises that he was forced to write in the aftermath of the Council of Nicaea in 325. As bishop of Caesarea, he reluctantly put his name to the Creed that imposed the word *homoousios* ("being of one essence") on the clergy; but, as he showed in a letter to his own flock, he did not construe this term to mean that God and Christ were equal or identical. He set out the scriptural basis of his position in his writings against Marcellus of Ancyra, who, according to him, denied that the incarnate Christ possessed his own identity (*hypostasis*) and made him only a temporal emanation of the Father. Eusebius was prepared to speak of Christ as the second member of a triad, who existed with the Father before the ages and brought the cosmos into being, but he never calls him eternal or consubstantial with the Father. Following Origen, he held that the Father was God by nature (*ho theos*, *autotheos*), whereas Christ was only God by derivation (*theos*; cf. John 1: 1); in so far as he was equated with the Wisdom of Proverbs 8: 22, he could even be called a creature. At first it seemed that his position, upheld as it was by the Council of Antioch in 341, was likely to triumph over that of Athanasius, who maintained that all three persons of the Trinity were equally divine. The orthodox position after 381, however, was that Christ could not be called a creature (whatever we make of Proverbs 8: 22) and that the Father's priority in the order of generation does not entail the subordination of the Son.

Eusebius' theology thus became obsolete, but his scholarship did not. No historian undertook to do his work again, though some of his continuators offered a different view of Constantine. His narrative was taken up in Greek by Socrates, Theodoret, Sozomen, Gelsasius, and Philostorgius, and in the West by Rufinus, another Origenist. His enduring reputation is attested in the West both by Rufinus' Latin version of the *Ecclesiastical History*, and by the name of Rufinus' great contemporary Hieronymus Eusebius, better known to us as Jerome. His celebration of Constantine as God's vicegerent, with power to summon councils, to dictate a creed, and even to unseat religious dignitaries, strengthened the hands of later Eastern sovereigns in their dealing with the Church. Most of his works survived in Greek, for all Athanasius' efforts to portray him as an Arianizing heretic. This he was not, but rather a conservative and peaceful ecclesiastic; no doubt he spoke from the heart in his *Life of Constantine* when he alluded to Athanasius, without naming him, as one who had gratuitously sown discord in the Church. The consequence was that he, like his sympathetic master Constantine, failed to

achieve the rigorous orthodoxy that enabled many worse men of his epoch to be recognized as saints.

MARK EDWARDS

Biography

Born *c.*AD 260 in Caesarea, Eusebius was a pupil of Pamphilus who gave him access to the library of Origen. Elected bishop of Caesarea *c.*313, he attended the Council of Nicaea in 325 and the Council of Tyre in 335. Of his many works the most important are his *Ecclesiastical History*, the model for all subsequent histories of its type, and a *Life of Constantine*. He died in 339.

Eustathios *c.*1115–*c.*1195

Archbishop of Thessalonica and scholar

Eustathios was a commentator on ancient literature and a composer of brilliant speeches. He belonged to a circle of learned men at the end of the 12th century that included famous scholars such as Michael and Niketas Choniates, Euthymios Malakes, and Gregory Antiochos.

He was born around 1115 in Constantinople, where he was a pupil of Nikolaos Kataphloron, who was a well-known rhetorician and perhaps also his uncle. He spent some time with other colleagues such as Euthymios Malakes, later the metropolitan of Neopatras, at the Euphemia monastery in Constantinople. Eustathios mentions his education only twice: he speaks about his severe teacher and an expedition with him into the outskirts of Constantinople to visit the broken column at Pinakidion.

Eustathios started his career as a scribe at the patriarchate and soon became deacon with responsibility for the sacred treasures during the reign of patriarch Luke Chrysoberges (1157–69/70). Thus he was attached to the group from which the higher ranks of the clergy were chosen. After 1166 he is mentioned as master of the rhetoricians (*magistros ton rhetoron*), the highest teaching position at the patriarchal school, which he held until he left Constantinople. Following in the footsteps of his teacher Kataphloron, Eustathios became a very successful teacher and continued teaching after his move to Thessalonica. Sons of distinguished Constantinopolitan families were even sent to him there for lessons.

Eustathios rose up the ecclesiastical hierarchy and held several posts of a juridical and fiscal nature. During the patriarchate of Michael III Anchialos (1170–78) his career stopped for some time: he lost his post as a deacon at Hagia Sophia, because the deacon who had been dismissed by Luke Chrysoberges was reinstated. He complained about this in a short document (a so-called *hypomnestikon*) and sent a petition asking for support to Michael Hagiotheodorites, the powerful minister of transport and internal affairs (*logothetes tou dromou*). He was successful and was nominated for the see of Myra, but within a short time he was assigned on the orders of the emperor to Thessalonica, where he arrived around 1179. In 1185 the Normans conquered Thessalonica. Defending his diocese, Eustathios was captured but well treated. The occupation did not last long, and the Normans were soon routed by general Alexios Branas.

Eustathios had some problems with the local clergy and he published some critical remarks about the monks' lifestyle (e.g. his pamphlet *On the Improvement of Monastic Life*), which provoked his temporary expulsion from Thessalonica. In February 1191 he delivered a speech in front of Isaac II Angelos (1185–95) in Philippopolis and by the end of April he was back in Thessalonica. After his reinstallation by the emperor Isaac II a new conflict arose, but this time the patriarch Georgios II Xiphilinos personally acted for him and it seems that he lived the rest of his life without troubles until his death in 1195/96.

Eustathios, one of the best-known scholars, commented on a wide range of ancient literature. Two fragments of his commentary on Pindar are preserved. He wrote voluminous commentaries on the *Iliad* and *Odyssey* of Homer citing many ancient authors (some fragments are preserved only in Eustathios). And he did further philological work on Aeschylus, Dionysius Periegetes, and Strabo.

In his official capacity he composed a few speeches for the emperor Manuel I Komnenos (1143–80), whom he supported politically and sometimes dared to criticize. He delivered speeches on various subjects, including a shortage of water in the capital, on the marriage of Alexios II, son of Manuel, to Agnes of France (1179), and on the wedding banquet in the city. In 1180 he delivered the funeral sermon (*epitaphios logos*) for the emperor Manuel. Later he glorified Isaac II Angelos in several speeches.

The capture of Thessalonica (1185) by the Normans was a traumatic event for all its inhabitants. Eustathios's account (the *Capture of Thessalonica*) is in two parts: the first deals with

the reign of Andronikos I Komnenos (1183–85); in the second part the author describes the capitulation of the city and his own capture. A collection of 47 of his letters also survives. Eustathios provides the modern scholar with valuable insights into ancient literature and also a window into the learned culture of the late 12th century.

Evagoras *c.*445–374/73 BC

Ruler of Cypriot Salamis

For much of the 5th century BC Cyprus was a bone of contention between the Greeks and Persia. When in 449 BC Athens, the leading Greek maritime power, and its alliance (the Delian League) were forced to come to terms with the Great King (the so-called Peace of Callias), whereby Cyprus was conceded as belonging within the Persian sphere of influence, the Greeks of Cyprus were effectively left to fend for themselves. The Persian-backed Phoenician minority quickly gained the ascendancy and Phoenician kings were imposed on a number of Greek Cypriot cities, including the most important, Salamis, which had been ruled by the Teucrid dynasty since the city's foundation at the close of the Bronze Age. A member of this dynasty, the youthful Evagoras, was forced to flee, but he returned a few years later (possibly in 415/14 BC), perhaps with Athenian help, expelled the Phoenicians, and restored Greek royal rule. It is commonly believed that Evagoras immediately submitted to Persia and paid tribute, but this is unlikely. At any rate his actions in helping Athens, an enemy of the Great King, do not point to such a conclusion.

The evidence for the career of Evagoras is none too plentiful and much of it is equivocal, but on balance it seems to point to his having been from the very start fixed on the policies we see him pursuing in later years. The development and strengthening of Salamis was the first and indispensable step to unifying the island under his rule and wresting it from Persian control. Close ties with Athens, the heart of Hellas, and the full Hellenization of the island went hand-in-hand with this aim. It should be stressed that Hellenization in the Cypriot context meant (for the Cypriot Greeks at least) a process of catching up with their fellow Greeks. Having lived in relative isolation for many centuries, the Cypriots still adhered to older ways of living and thinking.

By 412 BC Evagoras had rendered Athens, locked as it was in a life-and-death struggle with Sparta (the Peloponnesian War), services sufficiently important for both him and his sons to be rewarded with the city's citizenship. In 405 BC, when the Athenian fleet was destroyed by Sparta, the Athenian general Conon, with a number of warships and many hundreds of Athenians, took refuge with Evagoras in Cyprus. Together Conon and Evagoras planned the defeat of Sparta and the restoration of Athenian power. Because Persian money and resources were necessary for this, Evagoras made his peace with the Great King and agreed to be his tribute-paying vassal. In 394 BC at Cnidus the Spartan fleet was decisively defeated by a Persian-financed force led by Conon. The Spartan naval hegemony was over. A grateful Athens heaped honours on the two men, including the setting up of their statues in the Agora next to the image of Zeus Soter, an unprecedented and extraordinary gesture, extended only to two other men, Timotheus, the son of Conon, and, centuries later, Hadrian, the great Roman emperor and philhellene.

Evagoras now turned his attention to the unification of Cyprus, which meant the subjection of the other city kingdoms of the island, all of them tribute-paying clients of Persia. He seems to have been well on the way to achieving this when the Great King, fearful and suspicious, resolved to strike first and restore the status quo. War broke out around 390 BC and lasted for some ten years. Allied with Athens, who repeatedly sent ships and troops to the island, and Egypt, Evagoras initially went from success to success. He captured Tyre and caused much of Phoenicia and Cilicia to revolt against Persia. Citium in Cyprus, the main Phoenician stronghold on the island and always strongly pro-Persian, nevertheless held out, and the tide definitely turned against Evagoras when Sparta and Persia enforced the King's Peace in Greece in 386 BC. A central clause of the peace recognized Greek Asia and Cyprus as belonging to the Great King. Athenian forces evacuated the island and Evagoras stood alone, bereft of his vitally important Greek support. A mighty Persian armada invaded the island, probably in 385 BC, and though Evagoras fought well and bravely, and with considerable initial success, in the end he found himself besieged in Salamis and was forced to come to terms. He was still strong enough, however, to resist complete subjection to Persia and to insist instead on being granted his previous status of an autonomous, but tribute-paying, client king. He died a few years later, assassinated with his eldest son, in rather mysterious circumstances in 374/73 BC.

One of the most eminent of British historians summed up the career of Evagoras thus: "There are few more striking demonstrations in Greek history than the attempt ... of Evagoras of Salamis, with the limited resources of a small island, to challenge the great Persian empire and to make Cyprus more Greek than Greece" (J.B. Bury in *A History of Greece*, edited by Bury and R. Meiggs, 3rd edition 1951, p.73). That contemporary Greece, and in particular Athens, whose honorary citizen he was, would have concurred fully with this judgement is proved not merely by the high praise of the prominent Athenian orator Isocrates (above all in his pioneering oration, the *Evagoras*), but also by two new fragments (identified in 1979) of the stele bearing the decree voted in honour of Evagoras by the Athenian assembly in 393 BC (D.M. Lewis and R.S. Stroud, *Hesperia*, 48 (1979): pp. 180ff.). It would appear that the public herald was to proclaim on the occasion of a dramatic festival, *inter alia*, that Evagoras had done his duty by Greece and Greek freedom as a Greek ought.

While Evagoras' policy of the further Hellenization of Cyprus met with much success (the wholesale importation of Athenians and their culture left an indelible mark on the island), his political aims failed. After so many years of war, which exhausted the resources of Salamis, he was at the end no nearer his purpose than when he began. Nevertheless, his goal of a united island that would moreover form part of the wider Greek world, and the tenacity with which he pursued it, lived on to inspire the modern Greek Cypriots in their own equally long struggle for national rehabilitation.

P. J. STYLIANOU

Biography

Born *c.*445 BC as a member of the ancient Teucrid dynasty of Cyprus, Evagoras was at first forced to leave the island but returned *c.*415/14 to expel the Persian-backed Phoenicians and restore Greek rule. Allied with Athens, he united most of Cyprus. After the King's Peace (387/86) he defied the Persians and secured honourable terms. He was assassinated in 374/73 BC.

Evagrius of Pontus *c.*345–399

Monk and theologian

Judging from the sophistication of his works, it is clear that Evagrius received a fine Classical education. His theological formation was with the Cappadocian Fathers – he was ordained a reader by St Basil and a deacon by St Gregory of Nazianzus; Evagrius described Gregory as the one who had "planted" him. After accompanying Gregory to the Ecumenical Council of Constantinople in 381, Evagrius fled for fear of causing scandal, first to Jerusalem and then to the Egyptian desert. There he came into contact with the great elders of the day, and particularly with St Macarius of Egypt and St Macarius of Alexandria. From the living experience of the Egyptian desert, Evagrius drew the substance of his teaching on the ascetic life.

Evagrius' genius lay in his ability to systematize what he had learned in the desert, and to present it in a form that was intelligible to the educated reader. His systematization of the spiritual life is presented in three major works: the *Praktikos*, 100 chapters on the ascetic struggle; the *Gnostikos*, 50 chapters on the proper conduct of the true gnostic; and the *Kephalaia Gnostika*, 6 centuries, each of 90 chapters, dealing largely with the more speculative aspects of his thought. In this last work Evagrius reproduces and reifies the cosmological speculations of Origen. He posits the pre-existence of a Henad of pure intellect, engaged in the contemplation of God. A rupture is produced by the fall of these rational beings from contemplation, due to satiety or negligence and occasioning the second, physical, creation, in which each intellect is given a soul and body so that it might return, by way of contemplation, to the original unity.

Evagrius' work is chiefly concerned with the stage of return. The path back to God shown by Christ requires a conscious turning from materiality, both in body (the struggle against the passions) and in intellect (the divestment of forms). One begins with the practical struggle that produces love. The intellect must then turn to the contemplation of nature, perceiving the inner realities of creation and then passing on to essential knowledge, true theology, the contemplation of the Holy Trinity. Each of these stages requires a proportionate divestment of the intellect from all forms, material and immaterial, until it is perfectly "naked" and reunited to unoriginate intellect. Thus the original state of all things is restored and the *apokatastasis* (restoration) is accomplished.

Evagrius died just before the outbreak of the Origenist controversy in Egypt. It is, however, clear that it is largely his brand of Origenism that was condemned at the Fifth Ecumenical Council of 553. This black mark against his name did not, however, put a stop to his influence. The Church tradition took the eminently sensible course of discarding his metaphysical speculations and keeping much of his spiritual teaching under a pseudonym, usually that of Nilus. Evagrius' work was simply too valuable to be lost for the sake of his overenthusiasm for metaphysical speculation. He had crystallized much of what was best in the Egyptian desert, not only in his *Praktikos* but also in other works, such as his *One Hundred and Fifty-Three Chapters on Prayer*, *Ad Monachos*, and *Texts on Discrimination*. The *Kephalaia Gnostika* disappeared from the Greek tradition, being preserved only in the Syriac.

Evagrius has often been criticized for giving a disproportionate role to the intellect. There is a great deal of truth in this observation, but it has to be nuanced. He had no antipathy to the material order – the body and soul are there to help the intellect, not to hinder it. Moreover, intellect, soul, and body form a whole, the soul forming the bond of unity. On the Last

Day, soul and body are to be raised to the level of intellect. Evagrius allows a certain role to the heart in the spiritual life, linking it to knowledge and wisdom and treating it as the locus of the spiritual struggle. He was certainly not a dualist, although it is true that his anthropology lacks balance.

Evagrius was a crucial figure in the shaping of the monastic spiritual tradition. St John Cassian and Palladius were early disciples, and did much to propagate his teaching. His work rapidly entered into the mainstream. His influence is palpable in the works of St Diadochus of Photice and St John Klimakos. St Maximos the Confessor made extensive use of Evagrian structures and terminology, noticeable throughout his work but especially in the *Chapters on Love*. His influence is also discernible in the *Centuries* of Thalassios and Hesychios of Batos. There is a significant section of Evagrian material in the *Philokalia*, ascribed to St Nilus in the original editions, but restored to Evagrius in the recent English translation. While his attempt to integrate the Christian philosophical tradition with the wisdom of the Desert Fathers was not entirely successful, it has been remarkably fruitful.

MARCUS PLESTED

Biography

Born *c.*345 at Ibora in Pontus, Evagrius was ordained a reader by St Basil the Great and a deacon by St Gregory of Nazianzus. With Gregory he attended the Council of Constantinople in 381 and then fled into the desert of Egypt to become a monk. He wrote a number of works on the ascetic life of which the most important are the *Praktikos*, the *Gnostikos*, and the *Kephalaia Gnostika*. He died in Egypt in 399.

Evil Eye

Many elements of belief associated with commonly held ideas of the evil eye are evident throughout the Greek tradition from antiquity to the present day. While the basic notion of the evil eye, that harm or damage may be caused by a glance, is found unequivocally at many points in this tradition, it is probably more helpful to see it in the context of a larger group of beliefs evident in Greek thought, which involves the idea that change in physical or emotional condition may be effected in humans, animals, and inanimate objects by means of the power of sight alone and without obvious physical contact. The ability to cause such change is not confined to human beings, for it is also attributed to various supernatural powers and forces; nor is the change thought to be necessarily evil, although it is without question most commonly associated with bad effects and the fear that an envious, jealous, or perhaps hateful glance may cause serious harm is particularly prominent. Care is to be exercised in relating the Greek tradition concerning the evil eye to superficially similar but often significantly divergent ideas found in a broad range of cultures around the Mediterranean and beyond.

Firm literary evidence for the existence of many elements within this complex of ideas goes back at least to the early Classical period, while cross-cultural comparison and archaeological evidence may well suggest that such beliefs were present in some form from the very beginnings of a recognizable Greek culture. Phrases directly equivalent to the term "evil eye", such as *vaskanos ophthalmos* or *ophthalmos poneros*, are attested only from later antiquity, but writers throughout the pagan tradition such as Aeschylus, Plato, Theocritus, Callimachus, Apollonius Rhodius, Libanius, and Heliodorus allude in a wide variety of contexts to the closely related idea of the malignant and communicable power of envy (*phthonos*) or jealousy (*vaskania*); indeed, it is probable that the verb *vaskainein* in ancient Greek is to be taken primarily as meaning "to bewitch", very much in the sense of casting the evil eye through jealousy. Kindred notions are also found in the powers attributed to the gorgon and basilisk of Greek myth. Plutarch (*Quaestiones Convivales*, 5. 7. 680–83) provides the fullest discussion of the topic in antiquity and proposes that the eyes of a jealous person emit a stream of particles that strike the victim and so transmit harm, a theory of explanation close to one suggested by Democritus (to which he alludes) and followed by several later writers. As Plutarch also reveals, the notion of malignant envy or the evil eye was sometimes treated with suspicion and scorn in antiquity, but nevertheless its persistence in the Greek tradition as a whole attests to its general acceptance.

A number of passages in the New Testament (e.g. Matthew 20: 15, Mark 7: 22, and Galatians 3: 1) are connected with this tradition and Church Fathers, such as Basil, John Chrysostom, and Eusebius, discuss the belief and its implications for Christianity. All conclude that the apparent power of the evil eye is to be attributed to the activity of the Devil, but all fail to deny completely the validity of the idea. Given the inability of such intellectual early Christian authorities to do so, it is not surprising that the literary and material record from the Byzantine period down to the present day indicates a widespread popular belief in the power of the evil eye and in apotropaic practices associated with it, many of which are scarcely Christianized.

Belief in the evil eye is thus very widely attested, though not universally accepted, in the popular culture of modern Greece. The term generally used is *kako mati* (evil eye) or simply *to mati* (the eye), although there are many other local and regional expressions, most derived in some way from the *ophthalmos* (eye) of ancient Greek (e.g. *thiarmos* in western Crete). Symptoms associated with "the eye" tend to be ill defined, since specific indications will normally suggest a more

conventional diagnosis, but in general everything thought to have been affected by it will show signs of sickliness and loss of function. Symptoms in adults commonly include a feeling of malaise or depression, yawning, chronic feverishness, nausea, or headache; young children may sleep badly, lose their appetites, or cry constantly; animals will display signs of weakness, lethargy, and infertility; crops will fail to grow or will wither; and machinery will cease to function properly. Despite its vague symptoms the evil eye is thought to be very serious and, if left untreated, potentially fatal.

Explanations of the cause of the evil eye focus most usually on perceived jealousy or envy. It is commonly associated either with over-zealous admiration to the point at which the thing admired is actually coveted or else with the expression of insincere admiration. Some individuals are thought particularly likely to cause it, perhaps because of their social situation (e.g. elderly spinsters) or their unpleasant demeanour, while physical characteristics, such as blue or green eyes (usually an indication of foreignness), may also be thought to be signs of danger. Occasionally it may be thought to have been deliberately induced by magic. The view that the evil eye may be cast unknowingly and without any deliberate intent is, however, also widespread, making both detection of origin and prevention very difficult.

Practices to avert the evil eye are numerous and varied. Among the most common objects employed are cloves of garlic, blue beads or thread, the image of a staring eye (usually blue), and Christian symbols and objects such as the cross or an amulet containing holy material; these are either worn or placed in contact with whatever is being protected. Other techniques involve such things as spitting after making a compliment, or the invocation, either aloud or silently, of a spell or prayer.

Diagnosis and cure of the evil eye are also performed in a wide variety of ways, many of which show strong regional and local characteristics. Healers, often women, are to be found and openly acknowledged in most villages and towns. Among the commonest methods of diagnosis and cure, which usually form a single ritual, are those that involve dropping a substance or object (often oil but perhaps salt, incense, charcoal, or a cross) into a vessel of water. Affliction is determined through the behaviour of the material in the water, and, in the curative phase of the ritual, victims will drink some of the water or have it sprinkled on them; sometimes the healer will exhibit the victim's previous symptoms. The rituals, whatever their precise nature, are accompanied throughout by spells or prayers that almost always involve at least some overtly Christian elements, although these are often used in ways that are far from orthodox. Indeed, the Church, doctrinally speaking, disapproves of the popular notions of the evil eye since these tend to challenge the central Christian principle of the omnipotence and goodness of God. Nevertheless an acceptable explanation is found by seeing the supposed power of evil eye as a manifestation of the familiar activity of the Devil or his demons operating through humans, and the Orthodox Church has available, at least at a local level, a fully Christian ritual for removing it.

Execias

Potter and painter of the 6th century BC

Execias worked as a vase painter from about 545 to 530 BC, but his career as a potter started earlier: his signature is recognized on an amphora representing Heracles and Geryon (now in Paris, Louvre F 53, from Vulci), which is assigned to the so-called Group E, as well as on a number of cups (e.g. Munich, Antikensammlungen 2044, from Vulci). He signed a neck amphora (Berlin, Staatliche Museen 1720, from Vulci) and a type A belly amphora (Vatican Museums 344, from Vulci) as both potter and painter: "Execias painted and made me". Execias' great contribution to the Athenian black-figure tradition lies in his potting as well as his painting. Although the number of vases attributed to him is not large, the range of shapes is very wide, including amphorae (type A and type B), neck amphorae, a Panathenaic amphora, a *dinos* (goblet), a *pyxis* (box), cups, a calyx crater, and funerary plaques. He was responsible for the development of the type A cup and the type A belly amphora – both vases are of large size, around 60 cm high – and probably invented the calyx crater since the earliest surviving example was decorated by him (Athens, Agora Museum, from the Acropolis north slope). He demonstrated a preference for amphorae, especially of the neck type and of

type A, identified by its decorated flanged handles and a stepped foot.

The influence of the earlier Group E has been observed in his work, especially in his painting style as well as in his choice of ornaments and shapes. His scenes are simple, including only the essential elements of a composition. He demonstrated, however, an interest in the detailed representation of armour, manes, hair, and drapery, and experimented with the rendering of three dimensions. His workmanship is characterized by precision and his scenes of action by originality, since he seldom used standard motifs or compositions. He preferred to interpret well-known scenes anew, such as Ajax carrying Achilles, or invent others, such as Dionysus in his ship.

Execias has been considered a master of narration; by eliminating extraneous figures from his scenes, he focused on just those essential for his story. Despite the limitations of the black-figure technique, he often attempted to render some degree of emotion on the faces of his figures without distorting them, as on the mourners' faces on his funerary plaques. He preferred scenes that displayed strong tension in a subtle way, while occasionally depicting the moment before the action, as in the scene of Ajax's suicide (on a belly amphora, Boulogne Museum 553, France). In these respects Execias could be considered the forerunner of the Classical style.

Just as Execias had a liking for certain vase shapes, he also favoured specific patterns framing his pictorial scenes. Chains of lotuses and palmettes with separated and finely drawn leaves ornamented the neck or framed the panels of amphorae. The handles of his type-A amphorae are decorated with a tendril of ivy leaves.

His originality is also expressed in other forms. He broke the Attic convention of a tondo in the interior of cups and painted Dionysus sailing across the interior of a *kylix* (wine cup, Munich, Antikensammlungen 2044, from Vulci). Both the "coral-red" background of the scene and the pair of eyes decorating the exterior of the cup seem to be his inventions. Moreover, he was the first painter to depict ships sailing around the rim of a *dinos* (Rome, Villa Giulia Museum 50599). Execias often named not only his heroes but also their horses, the representations of which are classified among his favourite subjects.

Execias' iconographic repertoire is based on mythological scenes, especially those related to the Trojan War, but few of them followed established patterns. Unlike his contemporaries, he showed a lack of interest in the secular *komos* (revel) and the symposium, while the sole scenes from everyday life that he depicted are the *prothesis* (laying out) and the *ekphora* (carrying to burial) of the dead on funerary plaques. His Trojan scenes are devoted to episodes from the lives of Ajax and Achilles or to the events leading to their deaths and do not follow the versions of the myth found either in the *Iliad* or in any other of the known literary texts. Thus, Execias depicted Ajax and Achilles playing a board game – the scene appears here for the first time in Greek art and was repeated numerous times in vase painting thereafter – Ajax's suicide, Achilles killing Penthesilea, Ajax lifting the dead Achilles from the ground, the dead Patroclus fought over by Hector and Diomedes, as well as scenes with Memnon. Although Execias does depict the heroes Heracles, Theseus, and the Dioscuri, it was the two Trojan heroes that prevailed in his scenes. It has therefore been suggested that Execias countered the heroic virtue that other artists portrayed through Heracles by his use of Ajax and Achilles.

Although Execias' interest in Heracles was not remarkable, the scene with Heracles wrestling with the lion introduced to Athenian vase painting the composition of the lion fight in a prone position. His treatment of the Dioscuri is also innovative: he represented the homecoming of Castor before Polydeuces and their parents, Leda and Tyndareus. Previously the two heroes had appeared either at the Calydonian boar hunt or at the wedding of Menelaus and Helen. Execias was less interested in the depiction of a specific mythological event than in the heroes themselves.

ELENI ZIMI

Biography

Execias of Athens was active as a painter and potter from about 545 to 530 BC. He signed two amphorae as both potter and painter and his contribution to Athenian black-figure vase decoration is recognized as combining both activities. He departs from convention to depict both the character of his subjects and the tension of the moment.

Exile and Detention

Myth repeatedly describes individual banishment, usually for murder, but also for incest and other forms of sacrilege, as religious purification of a whole community. The outcast, interdicted from fire and water, deprived of ancestral worship, and cursed with all his issue, was deemed legitimate prey for any man. His only possible safety came from supplication at alien shrines or courts, and mere sufferance was often his most ambitious hope. Survival of this religious element of banishment into the time of the city state can be illustrated by *inter alia* a historical event and a festival at Athens. Some years after Megacles, the head of the Alcmaeonidae, had in 632(?) BC sacrilegiously allowed the suppliant supporters of the defeated Cylon to be slain, not only was the whole clan exiled but the

bones of its dead were exhumed and cast beyond the borders of Attica. At the purificatory festival of Thargelia in honour of Apollo, Athens still included in the Classical period the practice of beating and driving beyond its borders two *pharmakoi* (scapegoats) who at least theoretically took the evils of the city with them.

Banishment in the Archaic, Classical, and Hellenistic periods could be suffered by whole communities, groups, and individuals. Inhabitants of conquered cities were at the mercy of their victors, who sometimes chose to drive them out. That they could often then keep a sense of communal identity was due to allies who gave them shelter within their walls or found them land to settle, and they often later managed to regain their homes (all three of these fates befell the Plataeans driven out by the Thebans at the beginning of the Second Peloponnesian War). The survivors of the citizens sold as booty when Philip II sacked Olynthus in 348 were settled 32 years later by Cassander in his new foundation of Cassandreia.

Greek historians frequently do not make clear whether groups (or individuals) were exiled or fled voluntarily. In most cases their removal was due to governmental change in the struggles between tyrants, oligarchs, and democrats. Nearly all these exiles were from the upper classes, and could stay with sympathizers or had connections in other states, and frequently returned home at a change of government (that they themselves sometimes engineered) or upon an amnesty.

Individual exile was largely a political weapon. Most victims were politicians or generals, who suffered for real or alleged treason, military failure (as in the case of the historian Thucydides), or just unpopularity. The punishment, that was for either life or a set number of years, could be severe because it usually entailed deprivation of civic rights and confiscation of property. An exile returning illicitly ran the risk of summary execution; anyone harbouring an exile became himself liable to expulsion. Individual recalls and general amnesties were not, however, uncommon: Diodorus Siculus states (18. 8. 5) that according to Alexander the Great's decree in 324 BC, 20,000 Greek exiles were permitted to return to their homes. Voluntary exile could be chosen to avoid trial and even after the sentence of death had been passed (Socrates famously refused his friends' request to go into exile). In the 5th century BC the Athenian *ekklesia* was enabled to vote in favour of holding an ostracism, whereby if at least 6000 citizens took part the man whose name was recorded on the highest number of *ostraka* (potsherds) was exiled, without loss of citizenship or property, for ten years. Aristotle claims (*Athenaion Politeia*, 22) that the law was introduced by Cleisthenes in 508/07 BC, but the first ostracism was not held until 487. The last man ostracized was the demagogue Hyperbolus between 417 and 415, after which the *graphe paranomon* (indictment for offence of proposing an illegal law or decree) became the preferred means of attacking politicians. Forms of ostracism were employed also at Argos and at Syracuse – at the latter it was called *petalismos* ("leafing") since the names were written on olive leaves.

Information on detention is scant and largely Athenian. Non-productive long-term incarceration was extremely rare, its function served by deprivation of civil rights. Short-term incarceration, however, was occasionally used, sometimes in addition to a fine: otherwise the prison in Athens, under the supervision of the Eleven, held men on remand for certain crimes (e.g. maltreating parents or failing in military duties), men delinquent in the payment of some categories of fines, and men awaiting execution. Soldiers captured in battle were usually executed, taken or sold into slavery, exchanged, or ransomed. Occasionally they were held in detention as hostages, sometimes later to be exchanged (e.g. the Spartiates held by the Athenians in the city and elsewhere in their empire for nearly four years after their capture on Sphacteria in 425 BC). In contrast, the survivors of the Athenian expedition against Syracuse in 415–413 were imprisoned for life in nearby stone quarries, where some years later the dithyrambist Philoxenus, temporarily imprisoned for adversely criticizing the poetry of the tyrant Dionysius I, wrote one of his more famous pieces.

The most innovative penal theorist was Plato, who in his *Laws* prescribed varying terms of imprisonment and exile for different classes of criminals (citizens, metics, visiting foreigners, and slaves) and different crimes. More revolutionary, in addition to a large general and a purely punitive prison, he envisaged a reformatory (*sophronisterion*), where suitable offenders convicted of impiety were to be subjected to at least five years of counselling before being reintegrated into society (recidivists were, however, to be executed). Plato's ideas were largely ignored in antiquity.

Greeks under Roman rule were subject to Roman law, which, with modifications, survived in the Greek world until the Ottoman sack of Constantinople in 1453. Exile in the Byzantine empire was occasionally imposed upon economic offenders, but mostly upon the emperors' political opponents (often ecclesiastics). *Exoria* involved permanent or temporary exile without confiscation of property, *periorismos* restriction to a prescribed area with loss of property. Places of exile varied from remote borderlands and islands to monasteries and even personal estates. Conditions similarly differed, as can be seen from a wide range of letters written from confinement with complaints ranging from torture, starvation, and squalor to lack of books and nostalgia for life in the capital. Some politicians (e.g. Michael Psellos) voluntarily became monastic exiles until they deemed it safe to return to an active life.

In law prisons were regarded as remand centres, but in practice stay there was not always brief and, unlike in ancient Greece, they were common (there were five or six prisons within the complex of the Great Palace in Constantinople alone). They housed traitors, murderers, thieves, forgers, adulterers, magicians, and, if they could not be looked after at home, the insane, but only males since women were confined in convents to avoid risk of abuse from gaolers. Prisons fell into two types: those containing unchained and those containing chained inmates. In the former there were even some relatively comfortable single rooms, but conditions were particularly bad in the latter which were notoriously dark and cold and where food was scant and poor. According to legend one widow was so appalled that she offered her house for use as a prison, an offer accepted by the emperor Phokas (602–10), who nevertheless paid her the full price. Although the official in charge of prisons was subject to punishment if he illegally alleviated the lot of prisoners, some legislation attempted to ameliorate conditions, as did emperors, the nobility, churchmen, monks, and the pious with visits and donations of money

and food. References are numerous also to emperors, the Church, and rich individuals paying the ransom of prisoners of war (and those held by bandits), who stood a far better chance of rescue than in antiquity. Constantinople had a prison specifically for Muslims: a letter from the early 10th-century patriarch Nikolaos Mystikos to the caliph Al-Muqtadir claims that there Arab prisoners suffered only the deprivation of their friends and family since, among other comforts, they enjoyed spacious quarters, clean air, and even an oratory set apart for their devotions. Although private prisons were banned by law, monasteries were frequently so used.

After the War of Independence (1821–29) the new state of Greece established its own prisons for both short- and long-term stay for a wide variety of crimes. Conditions varied, but stimulus towards reform was hampered by the frequent changes of governors consequent upon changes of government.

Modern prisons are divided into several categories: in 1998 there were 28 in all, of which 12 were for those serving light sentences or awaiting trial, 7 were closed prisons for those sentenced to over 5 years of incarceration, 4 were rural prisons where inmates did agricultural work during the day, 2 were medical/psychiatric prisons, 2 were closed prisons for minors (the minimum age was 12) and the last was an open prison where bread was baked for hospitals and other prisons in Athens. Although the last execution took place in July 1972, capital punishment was not abolished until 1993. The average custodial sentence in 1998 was from 2 to 5 years, with a "life"-sentence of at least 16 years.

The percentage of the population incarcerated fluctuated greatly, some regimes even resorting to internal exile. In 1970 Greece had one of the lowest rates among the member states of the Council of Europe at 0.0409 per cent of the population, but this rose rapidly to 0.0607 per cent by the end of 1997 despite minimal numbers of females and minors. Over-crowding (approximately 50 per cent above capacity) was a growing problem, but legislation aimed at alleviation was being thwarted mainly by a reluctance of judges to grant bail (in 1997 over 30 per cent of those incarcerated were awaiting trial) and a rapidly growing number of foreign convicts (in mid-June 1998 over 40 per cent of a total prison population of 7021), largely for drugs-related offences. Moreover, poor conditions in prisons, shortage of qualified educational and therapeutic staff (approximately a third of prisoners were on drugs-related charges) and low morale of both warders and prisoners were fostering increasing recidivism.

F

Fable

A fable (*ainos*, *logos*, *mythos*) can best be defined as a fictitious, metaphorical narrative. It has been asserted that fables typically are about animals and have a moral purpose, but these restrictions do not take into account the genre's historical multiformity: fable collections traditionally include stories with rational as well as irrational characters, and the genre's functions may vary widely, notably from persuasive to satirical, from moral to explanatory, from didactic to illustrative. It is to this flexibility that the genre owes its remarkable, millennia-long vitality.

Throughout ancient literature fables are used in a variety of other literary genres. The oldest extant Greek fables occur in Archaic Greek epic (Hesiod) and lyric poetry (Archilochus, Semonides, Stesichorus, Ibycus, Simonides). In the Classical period fables are adduced in both prose and poetry; they are applied not only by tragedians (Aeschylus, Sophocles), satyric playwrights (Achaeus), and comedians (Aristophanes), but also by historiographers (Herodotus), rhetoricians (Aristotle), orators (Demosthenes (allegedly)), and philosophers (Socrates (allegedly), Plato, Xenophon). From the Classical period onwards fables are typically connected with the name of Aesop, the legendary fabulist. By then, already, fables were apparently so popular that authors could confine themselves to mere allusions, obviously presupposing the audience's knowledge of the rest of the story.

At the beginning of the Hellenistic period Demetrius of Phalerum compiled the first fable collection, probably an anthology of fables excerpted from the works of Archaic and Classical authors, made up as a repertory for orators looking for a fable that could appropriately be used in some speech or situation in accordance with the advice given by Demetrius' teacher Aristotle in what is the oldest extant treatise on fable as a genre (*Rhetoric*, 2. 20). Regrettably enough, Demetrius' collection has been lost but for its title (*Collections of Aesopic Fables*), preserved by Diogenes Laertius.

The extant fable collections all date from the imperial period of Greek literature. Most are in prose. Of the oldest one only fragments of 14 fables remain (*Rylands Papyrus* 493; early 1st century AD). The verse collection by Babrius (late 1st or 2nd century AD) has also been incompletely preserved, but 144 fables have come down to us in their original form, whereas knowledge of what has been lost may be gained from prose paraphrases. The largest collection is the so-called *recensio Augustana* (see below), consisting of 231 allegedly Aesopic, but really anonymous, prose fables concluded by *epimythia* (less felicitously called "morals"). In addition, we have three small prose fable collections, probably used in rhetorical education. One, by Aphthonius (4th century AD), includes 40 fables, all equipped with both a *promythion* (an introductory moral, serving as title) and an epimythion; another, by his contemporary Libanius, has only three fables; a third, anonymous collection (*Codex Brancatianus*) contains 14 fables with iambic *epimythia*.

At the same time, fables continued to be used in other literary genres. In the Hellenistic period fables are adduced not only by poets such as Callimachus and Nicander and by epigrammatists (Leonidas), but also by historiographers (Theopompus, Diodorus Siculus) and philosophers (Philodemus). In the imperial period fables occur not only in traditional genres – notably historiography (Dionysius of Halicarnassus, Flavius Josephus), oratory (Aelius Aristides, Dio of Prusa, Themistius), and philosophy (Philo) – but also in new genres such as epistolography (Julian, Libanius), romance (Aesop romance, Alexander romance, Achilles Tatius, Heliodorus), and biography (Plutarch).

Simultaneously, the theory of the fable was also studied. Of great importance is the treatise on fable by the rhetorician Theon (late 1st century AD), who formulated the oldest extant – and, according to some, the best possible – definition of the genre: "a fable is a fictitious story that gives the semblance of reality."

The polytheistic background of the ancient fables, traditionally featuring "pagan" gods, did not prevent the early Christian writers from using them in their own works, witness references in poems by St Gregory of Nazianzus, in epistles by St Basil the Great and St Gregory of Nyssa, in homilies by St John Chrysostom, and in apologetical works by Epiphanius of Salamis and Theodoret.

Byzantium preserved the heritage of the ancient fable tradition. On the one hand, the fables from antiquity were copied and paraphrased; on the other, they inspired Byzantine fabulists to write new versions or original fables of their own. The anonymous prose fables must have been very popular, demonstrated by the great number of manuscripts that regularly combine the "Aesopic" fables with the *Life of Aesop*. The fable collections can be subdivided into three classes, named after

the library where its principal manuscript was found, or after its editor: the ancient *Augustana* (Augsburg); the Byzantine *Vindobonense* (Vienna; 127 fables); and the *Accursiana* (Bonus Accursius; 130 fables). They are also called, respectively, *recensio* I, II, and III: II is mainly based on I and Babrius, III on I and II. The exact date and purpose of these collections are still under debate.

Two other Byzantine collections also predominantly derive from ancient Greek models. The 89 *Tetrastichs* attributed to Ignatius (9th century) are mainly inspired by Babrius. The collection of 62 prose fables ascribed to Syntipas (the legendary Sindbad the Sailor) and translated from the Syriac possibly by Michael Andreopoulos (*c.*1100) largely goes back to Babrius on the one hand and to the *Augustana* on the other; all of these fables have *epimythia*. Both the pseudo-Ignatius and the pseudo-Syntipas collections contain some fables that have not been preserved elsewhere.

Throughout the Byzantine period fables were, as in antiquity, frequently used in other literary genres, both in poetry (John Tzetzes) and in prose, particularly by epistolographers (Theophylaktos Simokattes), lexicographers (Photios, the *Suda*), philologists (Eustathios), historiographers (Nikephoros Gregoras, John Kantakouzenos, John Zonaras), paroemiographers (Apostolios), orators and rhetoricians (Michael Psellos, Theodore Prodromos).

Typical of fables are easy transitions from and to other genres and forms of imagery. Thus, fables are often reduced to, or based upon, proverbs and comparisons. Conversely, fables can also be elaborated into beast epic, whose function is typically satirical. Famous examples are the ancient *Batrachomyomachia* (Frog-Mouse-War; 1st century BC/AD) and the late Byzantine *Legend of the Ass* (early 16th century).

In Byzantine times the Classical fable tradition was further enriched with fables of Indian provenance. Greek versions of two frame stories served as vehicles for this influx of oriental fables. First, the Christian romance of *Barlaam and Joasaph*, adapted from a Buddhist prototype by St John of Damascus (8th century), contains a number of fables. Second, the book of *Stephanites and Ichnelates*, translated from the Arab *Kalila wa Dimnah* (which in its turn goes back to the Sanskrit *Panchatantra*) by Symeon Seth (late 11th century, at the instigation of Emperor Alexios I Komnenos), is interspersed with fables. Both books were widely read, as is clear from the numerous medieval manuscripts.

The *Stephanites and Ichnelates* remained so popular that it was twice paraphrased into modern Greek by superior order: first by Theodoros Zygomalas, protonotary of the patriarch of Constantinople, in the 16th century; later by Demetrios Prokopios (1721), commissioned by John Nikolaos Mavrokordatos. Both modern Greek versions were, in their turn, copied several times.

The first translation of ancient fables into modern Greek prose was by the Corfiot Nikandros Noukios (Venice, 1543; 150 fables). It was to be followed by many others (e.g. by Ioannis Patousos, Venice, 1752). More original, but clearly also modelled on the Classical fable tradition, are two modern Greek verse fable collections (*Mythoi*), one by Georgios Aitolos from Corinth (1525–74; 144 fables), the other by Jannis Vilaras from Ioannina (1771–1823; 20 fables). The former's rhyming political verses may be considered to be a predecessor of the elegant versions by the famous 17th-century French fabulist Jean de la Fontaine, who is one of the latter's sources of inspiration.

In modern times the text of the ancient fables was published. A milestone along the road was the edition by the erudite scholar Adamantios Korais (Paris, 1810); typically enough for a man who contributed so much to the consciousness-raising of the Greeks, the title of Korais's *Collection of Aesopic Fables* referred back to the prototypical collection by Demetrius of Phalerum mentioned above. The first edition of the *recensio Augustana*, by Schneider, was to follow suit (Bratislava, 1812).

That the fable tradition from the golden age of Hellas continues to be popular without abatement in today's Greece is evident not only from the inclusion of a fable in the famous *Life and Works of Alexis Zorba* by Nikos Kazantzakis, but also from two really modern media: the edition of a series of stamps and comic strips with *Fables of Aesop*. The latter may therefore without exaggerating be said to embody the Hellenic tradition.

Fairs and Markets

Periodic markets take place monthly or more frequently, typically once a week. Fairs are less frequent, typically annual, and often serve multiple purposes: religious, political, social, as well as economic. Both are worldwide phenomena.

"Landings, sailings, numbers of people and goods and ships: these prove the merit of a fair, a harbour, or a market", said Dio of Prusa in the 1st century AD. Evidence of Greek fairs and markets is scattered and piecemeal. Demosthenes and Aristophanes are among sources for the Classical period; Hellenistic inscriptions supply details of trade regulations at fairs; in Roman times, special coin issues, commemorating local festivals, imply busy economic activity there.

The agora was the central public space of an ancient Greek city. The word also denoted the activity of a market, whether it took place in that public space, at a fair, or at a harbour.

In Classical Greece fairs (*panegyreis*) were chiefly religious festivals, but trade was a part of almost every *panegyris*. Thus, at a festival at Andania, "the priests shall indicate a place for all sales. The city *agoranomos* [market supervisor] shall ensure that sellers sell fairly and cleanly and use the city's weights and measures. He shall not restrict the sellers as to volume of sales, or as to time, or charge them for the site" (no. 65, lines 99–107 in *Lois sacrées des cités grecques*, edited by Franciszek Sokołowski, Paris: Boccard, 1969). An Amphictyonic decree of the 2nd century BC prescribes currency equivalents to be operated by "the money changers who sit in the cities or at the *panegyreis*". Fairs, often lasting several weeks, could be interrupted by a city's periodic market. At Oenoanda, in western Asia Minor, the quadrennial festival was suspended on the sixth of the month, the regular market day.

Some fairs attracted dealers and customers for a range of merchandise: in Roman times the twice-yearly fair near Tithorea in Phocis sold "slaves, cattle of all kinds, clothes, silver, and gold" (Pausanias). Other fairs too, including the Pylaea at Delphi, were noted for slaves. Domestic animals are mentioned in several sources as a typical purchase at an annual fair.

Fairs often attracted tax-free status, *ateleia*. Some fairs were held in cities or just outside them; others traditionally took place far from any centres of population, like the mountain-top fairs still known in the Balkans and first mentioned in a work attributed to Aristotle (*On Marvellous Things Heard*, 104).

The great religious festivals were major commercial events. According to the Roman historian Livy: "The Isthmian Games had always been well attended ... because of their excellent location, which enabled the Isthmus to deal in all kinds of commodities imported over two different seas. The market there was a fair for Asia and for Greece" (*Ab urbe condita*, 33. 32. 1–3, abridged).

In the Hellenistic period the regular political gatherings of the Aetolian and the Achaean Leagues were accompanied by some kind of commercial fair or market. Under Roman rule a provincial governor's judicial progresses attracted trade: "the courts are in session every year, bringing together a numberless throng – litigants, jurymen, orators, nobles, attendants, slaves, pimps, muleteers, hucksters, whores, and craftsmen. Those who have any goods to sell can get the highest prices; nothing in the city is out of work, neither the draught animals nor the households nor the women. This contributes noticeably to prosperity", Dio observed. But the most important fairs continued to be the religious ones. We hear of the struggles of conscience that Christians faced in attending them. "A believer must not go near a fair, except in order to buy a slave (and thus save his soul) or to buy one of the necessities of life", according to the *Apostolic Constitutions* of the 4th century AD. Yet they attended; and Christian festivals slowly replaced pagan ones as the occasion for fairs. In Byzantine Greece the fair that began six days before St Demetrius's Day at Thessalonica attracted traders from Catalonia, France, and Italy. The Ottoman traveller Evliya Çelebi described the annual fair of the salt beef merchants, "infidels of Moldavia and Wallachia", held outside the walls of Constantinople for 40 days beginning from St Demetrius.

Thus fairs have a long history in Greece. Periodic markets, weekly to monthly, are less talked of. In Roman times there may have been such markets in northern Greece. Certainly they existed near the Aegean coast of Asia Minor, where inscriptions record ten-day markets around Magnesia and monthly markets elsewhere.

Cities of some size certainly supported daily markets in Classical times, as they do now. Written sources refer to various specialized markets: a cattle market at Sparta; a covered market (stoa) specializing in spices at Megalopolis.

Classical sources are most informative about the market at Athens. This occupied a considerable area, centring on the Agora. It included sections such as *eis tous ichthyas*, the fish market, and *eis toupsa*, delicatessen. There was a distinct women's market: maids could be hired there. Characters in Athenian Middle and New Comedy spent a good deal of time boasting of their success at market or complaining of the price of fish. Athens also held a monthly fair or market on the day of the new moon (*noumenia*) at which slaves and animals were sold: a slave acquired on that day might be named *Noumenios*.

Fairs and Markets: The Central Market in Athens, successor to the ancient Agora

In coastal cities, and in the Greek islands, periodic markets are not recorded in ancient times and are not common nowadays. Trade here has been seaborne, dependent on sea conditions, and thus unsuited to a market timetable. Instead, the practice is for a market to be set up at the harbour when ships arrive. This is seen in many places today when a ferry puts in, often signalling its arrival with a blast on the foghorn. The evidence in Classical texts is of the arrival of fishing boats being announced by a harbour bell. Early sources, beginning with Homer and Herodotus, tell stories that depend on this practice of impromptu harbour markets.

Family

Throughout recorded Greek history, the family has functioned as the central social unit. In ancient Greek there is, however, no word for "family" in today's sense, and the nearest equivalent, *oikos* or "household", refers not only to the human members of the family group but also to its property, be that house, land, tombs, slaves, or animals. This is evident as early as Homer's *Odyssey*. Crucial, therefore, to the continuation of the *oikos* was the production of legitimate heirs to whom the family property could be passed. Ancient Greek society was patriarchal, as indeed it has been until almost the present day. However, whereas in Homer the male hero stood alone at the head of his *oikos*, the *oikos* of the Archaic and Classical Greek polis, or city state, was tied closely to the social, military, civic, and religious structure of the city. While the polis provided protection from enemies to the *oikos* and its property, the *oikos* provided the polis with its citizen soldiers. The *oikos* of the Archaic and Classical periods therefore functioned on both a public and a private level. Although patriarchal, the *oikos* nevertheless laid great value on the woman's role as wife and mother. Proper and chaste behaviour was highly prized, indeed expected, by Greek society as a means of ensuring legitimate family succession and inheritance. The woman also played a central role in household management, and in the conduct of proper death ritual (preparation of the corpse and mourning) for deceased family members.

Marriage in ancient Greece, and throughout subsequent Greek history, was based on the principle of monogamy and, as again until recent times, was an arranged affair involving agreement between the bride and groom's families; this included agreement on the dowry, usually a sum of money, that the woman would bring to the marriage. At Athens during the Classical period the bridegroom was generally aged around 30 while, in order to ensure her virginal status, the bride was usually half his age. Following the wedding, the bride moved from her father's house to that of her husband. There, although sharing the family house and concerns, man and wife led distinctly different lives, for while the adult male participated daily in the public citizen life of Athens, the female remained at home, leading a private existence concerned only with domestic matters. In the case of an unsatisfactory marriage divorce was possible and could be instigated, in theory at least, by either husband or wife. Athenian law required that on divorce a woman's dowry be returned to her; this protected her from becoming destitute and made her an attractive candidate for remarriage. Procreation of children within marriage was highly important, not only to safeguard the inheritance of family property, but also to provide care for the parents in old age: indeed the nuclear family was often extended to include elderly relatives within the household. The production of children, furthermore, ensured that the older generation would receive the appropriate death ritual and proper burial when the time came, and that the family tomb cult would be maintained. Since inheritance of family property operated through the male line, sons were especially desired; daughters, by contrast, had to be provided with a dowry. It has therefore been suggested that infant exposure, which is known to have occurred, involved more female than male children, though hard evidence for this is not forthcoming. It is also worth noting that, since all sons had an equal right to share in their father's property, the production of a number of male children could also be considered problematic. Inheritance matters were protected by complex legislation, necessary since the polis was founded on an agrarian basis; where, for example, a family lacked a male heir, a son could be adopted or, alternatively, property could pass through a daughter to her sons.

As a result of a bias in our evidence, most of what we know about the family in Classical Greece relates to the Athenian upper class. It is, therefore, interesting to compare the case of Sparta, where the state claimed a much greater degree of involvement in the family and household matters of the Spartan upper class. The underlying reason for this was the maintenance at Sparta of a professional standing army. Following marriage, which was compulsory, the groom returned to a communal military life until he was 30. Consequently, husband and wife did not live together for a number of years, resulting in Spartan women leading more public and active lives than their Athenian counterparts, and being able to exercise a degree of control over family property matters. They were, furthermore, able to own property and wealth independently. Unlike Athenians, Spartan women were not married until they were fully grown, and then generally to a man of similar age. According to Xenophon, a Spartan man could have children with the wife of another consenting Spartan male, and a young wife married to an elderly husband might also produce children with another man: these arrange-

ments probably operated to combat cases of infertility, adoption of children also being practised. The decision to expose a child rested not with the parents, but rather with the tribal elders who had always in mind the military requirements of the Spartan community. Furthermore, the education of male children was not determined by their parents but by the state, which removed boys in their seventh year to communal barracks where they received a military, as well as traditional, education.

The Hellenistic period in Greek lands witnessed, as seen in the plays of Menander and others, a shift of focus towards the family's and individual's private affairs. This occurred as the polis structure weakened and the relationship between polis and *oikos* changed. For example, whereas in the Classical period at Athens one's membership of the polis depended on membership of an Athenian citizen family, in the Hellenistic period some states were happy to bestow citizenship on individuals descended from non-citizen parents. Furthermore, women in many states gained the ability to own and manage wealth and property in their own right, resulting in a new emphasis on their individual, as well as family, identity and worth.

During the Roman period the family underwent further evolution due, in part, to the introduction of Christianity. The most profound change revolved around the alternative roles now open to women. In the 4th century AD the emperor Constantine decreed that a woman did not have to marry, but could rather devote herself to the Church as a bride of Christ. This in turn impacted on inheritance law, for such women could now also bequeath property to the Church instead of to relatives. For the first time, priestesses aside, women could reject marriage and childbearing: either they could continue to live in their paternal home, or choose solitude, or reside within a community of women. This increase in celibacy and non-family life in the early Christian period applied equally to men as to women. Most men and women did, however, continue to marry and produce children. Marriages, as before, were arranged and contracts, recording financial agreements, were drawn up. As earlier, most girls were married by the time they reached 16, and a legal minimum of 12 years was set for brides. Now for the first time, Christian teaching established the requirement of fidelity within marriage for men as well as for women; further, in AD 326 Constantine went so far as to outlaw the ancient practice of concubinage, that is a stable sexual liaison between a married man and a woman not his wife. Many subsequent emperors, however, regarded this practice with greater tolerance. Divorce law, particularly relating to the grounds on which divorce was permitted, changed many times during the early Christian period, due perhaps in part to the influence of Christian teaching. Nevertheless, even though Christian belief stressed the indissolubility of human marriage as a reflection of the union between Christ and the Church, divorce continued to be a legal option. In the event of divorce, a woman's dowry had to be returned to her as before, while the children officially remained under their father's authority although they did not necessarily live with him. Abortion and infant exposure were now regarded with strong moral disapproval, though again the legal response was more liberal. Encouraged by the Church, some provision of care for orphans developed through private and local charity.

Throughout the Byzantine period the *oikos* comprised an essentially nuclear family. As earlier, however, no precise word for "family" exists in Byzantine Greek and the nearest equivalent, *syngeneia*, refers to both the nuclear family and the wider kinship group. Beginning in the late 8th and 9th centuries, these kinship groups began identifying themselves by adopting family names which were then passed to the next generation. Indeed, by the end of the 11th century these lineages were becoming, at the aristocratic level, the basis of political organization, giving rise to a "feudal" family network possessing great economic and political power. Marriage, therefore, represented an important family strategy for social and political advancement. By the 8th century the Christian marriage ritual was developing a definite form, with the exchange of rings, prayers, and blessings and the crowning of the couple with a floral wreath or later a metal diadem. Nevertheless until at least the end of the 9th century the marriage contract was a civil agreement, without any involvement of the Church in the legal aspect of the union. Gradually thereafter, however, the Church's marriage rite became the only acceptable way of joining man and woman in wedlock. Whereas in ancient Greece intermarriage between blood relatives had been commonplace, now incestuous marriage was severely prohibited, laws being passed as early as the late 3rd century AD: by the 11th century marriage was forbidden to any couple related up to the seventh degree. Furthermore, from the 6th century onwards, such prohibitions on marriage applied not only to blood relatives but also to those linked by the spiritual kinship of godparenthood. Although divorce continued to be a legal option, the grounds on which it was granted were strictly limited and remarriage was discouraged for both divorced and widowed spouses. Celibacy, on the other hand, claimed a higher moral status than marriage for both sexes, and individuals entering a monastery or convent were required to renounce their blood family in favour of spiritual kin. Except for the celibate, however, marriage, childbearing, and household management remained the prime female roles and, with the exception of a few women from imperial and aristocratic circles, the place of women generally remained confined to the secluded sphere of family life. In this context, the female as wife and mother commanded considerable prestige, enhanced by the all-important spiritual model of the *Theotokos*, Mary, as Mother of Christ. In the event of divorce, moreover, the children now no longer remained under the father's sole legal authority, the parental rights of mother and father having been balanced by the 8th century AD. Under Leo VI (886–912) a law was also passed to allow women to adopt children: consequently women who were virgins, or those who were barren, did not have to remain childless. Unadopted children were cared for in monasteries or orphanages, some having been abandoned in infancy even though infant exposure, like abortion, was legally forbidden. Regarding inheritance, the equal division of wealth and property among the family's children continued as earlier.

The centuries of Ottoman rule in Greece have thus far received relatively little study and have left scanty historical documentation relating to family life. Nevertheless, we can at least observe that, as long as the Greeks remitted the required Ottoman taxes and maintained a peaceful profile, matters of everyday domestic life were allowed to remain essentially

under the authority of the Orthodox Church. This ensured a large degree of continuity in Greek family custom and inheritance law. A rare example of the involvement of the Ottoman state in the Greek family concerned the selection every four years by Ottoman officials of promising Christian children who were then removed from their families: these children were converted to Islam and brought up in the service of the state to become skilled administrators or members of the military elite. This practice continued until the mid-17th century.

Following the liberation of Greece from Ottoman rule and the establishment of the Greek nation state in the early 19th century, the factor which had perhaps the most profound effect on the Greek family was urbanization. Gradually the power of the old endogamous land-based "archon" families, which had grown and flourished under the Ottomans, was replaced by a developing merchant middle class. Marriage dowries for both men and women in the form of property, land, livestock, and cash, and a trousseau of fine clothes, jewellery, and household goods for women, all underwritten by a matrimonial contract, now provided a channel for the transmission of wealth and therefore the means of achieving social mobility. The institution of godparenthood was also strategically employed in the formation of desirable family alliances. As in antiquity a strong desire for the production of sons persisted, as also did the separation of male and female roles into public and domestic spheres respectively.

Since the end of World War II and the Greek Civil War, numerous changes have taken place in Greek family life, at least in the ever-growing urban centres. The amassing of increasingly large cash and property dowries, particularly for women, was brought to an end in 1983 by a new family law which abolished the age-old practice of dowry exchange. This, however, does not mean that unofficial dowry agreements are no longer made: the most common practice is for the bride to bring to the marriage a house or apartment. This has contributed to a trend for the newly wed couple to establish their own independent nuclear family unit, in contrast to the previous traditional arrangement under which the bride was transferred to the groom's family. Nevertheless, the modern Greek word for "family", *oikogeneia*, can refer either to the nuclear or the extended family, and much moral value is set by Greek society on the family caring for elderly or sick parents. Increasingly in the cities young people now choose their own marriage partners, representing a major departure from the time-honoured custom of arranged marital unions. Developing alongside this can be seen the growing social and economic power of women, many of whom now contribute to the family not only in domestic terms, but also as paid employees working outside the home. Further, though Greek society has traditionally strongly disapproved of divorce, current rising urban divorce rates suggest changes in the perception and expectations of married life. In recognition of this, the law of 1983 endowed both parents with equal rights in respect to their children. Greece's current low birth rate is a cause of considerable concern for the country's leaders. This results from a number of factors, not least the improved education of women. Effective birth control, in particular the use of abortion, though still contrary to the doctrines of the Greek Orthodox Church, is widely practised. Also significant for the relationship of Church and family is the law of 1983 which made a civil wedding ceremony a legal, though still not widely popular, alternative to the Orthodox marriage ritual. Nevertheless, both family and Church still represent powerful forces in Greek life, with marriage and the production of children being greatly desired, expected, and morally respected.

Fascism

The word fascism derives from the *fasces*, bundles of elm or birch rods tied round a battleaxe and carried ahead of consuls as a symbol of state authority in ancient Rome. However, the term acquired its current usage in the 20th century. The ideology of fascism is the product of the economic and social crisis in Europe after World War I. Nevertheless, elements of fascism can be detected in the 19th century and beyond, as its roots reach back to the reaction of the ruling classes to the French Revolution.

Specifically, fascism refers to the 1919 movement formed by Benito Mussolini in Italy. The same movement brought him to power in 1922. Generically, fascism is an authoritarian movement, founded as Nazism in Germany, the Falanges in Spain, the Iron Guard in Romania, or the British Union of Fascists of Sir Oswald Mosley. Fascism was never a coherent ideological and social system comparable to Marxism, for example. In addition, fascist movements in various countries reflected their different national backgrounds.

In the case of Greece, the presence of fascism may be considered only in a broader sense. There has not been a fascist movement similar to those mentioned previously. On the contrary, the movements and politicians labelled fascist in Greece generally rejected the characterization as infamous. In fact, the term fascism was used against opponents of right-wing parties, against nationalists, and even sometimes against centrist-liberals. There is no doubt that during the era of dictatorships, such as that of Metaxas in 1936 or the colonels in 1967, fascist methods of violence and oppression were used. That happened also during the Greek Civil War (1944–49) and the era that followed it. However, these are methods used by a dictatorship or authoritarian regime whether civil or military.

The historical context of the development of what has been labelled Greek fascism remains linked to World War I and the catastrophe of Asia Minor in 1922. The brutal end to the long history of Hellenism in Asia Minor changed the whole social and political spectrum of Greece as two million refugees were suddenly added to the population. The destruction of national ideals had inaugurated a new era, a time of political and social crisis. In March 1924 the monarchy was abolished and the republic established. There soon followed political instability, coup d'état, social and economic crises, re-establishment of the monarchy, and finally the Metaxas dictatorsip in 1936 which marked this troubled period of modern Greek history.

The socialist and communist movements appeared simultaneously and the reaction against them soon followed in the form of nationalistic and authoritarian discourse. In May 1936 political disillusionment and depressed living conditions among workers and peasants led to strikes and social unrest, especially in Thessalonica. The refugees of Asia Minor reinforced the liberal and left labour movement. Within this context of domestic crisis, reinforced by an international economic and social crisis, fascist ideas appeared in Greece.

The Metaxas dictatorship was formally established on 4 August 1936, hence it has always been known as the regime of 4 August. It was an authoritarian regime using fascist methods against its opponents, especially left-wing liberals and communists. However, one should also remember that the Germanophile Metaxas, whose regime was sometimes considered fascist, was partly the creation of the Anglophile Greek monarch, king George II.

In one way or another, the regime of 4 August 1936 opened a long era of authoritarian government including the German occupation and the terrible Civil War, a struggle which in practice ended only with the fall of the colonels' dictatorship in July 1974. Yet authoritarian regimes are not synonymous with fascist regimes. For example, the colonels' regime, also labelled fascist, was a military dictatorship which had the acceptance and support of the USA, if not its blessing.

The real fascist movements in Greece after World War I remained as marginal as they were during the Civil War and the era following it. Nevertheless these marginal movements not only supported the dictatorships but also provided people who could be used by the regime and even by right-wing parties to carry out the oppression of the Greek public. This fact and, in a sense, the liberty of action allowed to small fascist groups gave the impression of a great fascist movement in Greece. In addition, both the communists and the left in general misused the term fascism as a weapon against their opponents. This linguistic abuse lent credence to the idea that dictatorships and right-wing authoritarian governments were in essence fascist.

However, from a sociological point of view, fascism never was a real political or ideological force in Greece. At this point it is useful to review the main traits of fascism: relatively coherent militaristic ideology, presence of a unique political party of the masses and a charismatic leader, significant popular support for the regime (e.g. the fascism in Italy or the nazism in Germany). Other traits of fascism are nationalism, populism, anti-communism, anti-liberalism, anti-democracy, monopoly of power, and the heavy use of propaganda and terror.

Greece has never had either a coherent fascist ideology or a unique fascist party of the masses and, of course, no significant popular support for dictatorships. Other traits of fascism observable in Greece, such as anti-communism, nationalism, anti-democracy, or the use of propaganda, are common characteristics of authoritarian regimes and even some liberal regimes (e.g. anti-communism or nationalism).

On the other hand, Greece, unlike France and a few other European countries, had no intellectuals developing fascist theories and ideas. Certainly there were nationalist intellectuals and some of their themes gave the impression of a fascist approach to Greek social problems. Indeed, some intellectuals were compromised hy their links to dictatorships. However, they produced nothing in terms of fascist ideology and even proclaimed their faith in democracy and justified their support of dictatorships as necessary under the "special" circumstances in which the country found itself at that time.

In conclusion, it appears that dictatorships, reactionary, authoritarian, and right-wing parties or movements were generally lumped together and called fascist in Greece by their opponents. Nevertheless, one should recognize that at times this conservative front did use methods of fascist inspiration and did oppose liberal reforms and liberal visions of Greek society, thus amalgamating communism with liberal and progressive ideas and using the army as a barrier against these visions and ideas.

Fasts

The Greek word *nisteia* (fast) has the general meaning of "not having eaten" or "being without nourishment". Most often, however, it is used in a religious context to denote the total or partial abstention from particular foods at certain periods of the year or on certain days of the week.

The act of fasting in antiquity was prevalent among the Greeks and was primarily associated with rites of mourning. Its main purpose seemed to be an apotropaic one; the mourning fast was seen as a powerful medium of warding off demonic spirits that could enter the body through eating and drinking. Fasting was also considered by the ancient Greeks to be a means of expiation and purification that rendered the faster fit for union with the deities. In the festival of Thesmophoria, an Athenian cult in honour of Demeter, a one-day fast was demanded of women. In the Eleusinian mysteries fasting was imposed on the initiate in order to render them worthy of receiving the sacramental drink. Another context in which abstinence from food was required in antiquity was that of manticism. It was believed that the one who fasted was more receptive to divine revelation. Thus, preparation by austere fasting was a necessary precondition for the dream oracles through which the gods unveiled the future to their devotees and made promises to them. Yet, fasting in antiquity, apart from its ritual functions, had also therapeutic ones. The Greek philosophers often praised self-restraint for hygienic purposes and recommended fasting for the sake of philosophy. Notwithstanding such philosophical ideas, fasting in antiquity did not seem to have an ethical pertinence.

In early Christianity the position adopted towards fasting was different and exceptional. Jesus had criticized the ritual formalism of the Pharisees because it assumed precedence over ethical action. Jesus, however, did not eliminate fasting for he spent 40 days in the desert praying and fasting and he suggested that both could be used as effective means against the devil, a view which is reminiscent of ancient practices. Yet, because of the association of fasting with mourning, Jesus regarded fasting in his Messianic presence as meaningless (Mark 2: 18). Early Christianity, therefore, broke away from Jewish customs regarding fasting. Dietary restrictions were considered redundant by Christians since they were signs of the old Covenant. Hence, in the 1st century, Christians did not observe any voluntary fasts. Fasting at that period was connected only with the preparation for the revelation of the Holy Spirit to the Apostles for guidance in their decision making.

In the post-apostolic period, however, Christianity imposed its own rules with regard to fasting, which seem to have developed from Jewish ones. In the 2nd century the Easter fast was established. The duration of this fast was analogous to the period of time that Christ spent in the tomb. However, it was not associated with mourning, but rather was viewed as a preparatory period for the celebration that lasted from Easter to Pentecost and as an outward sign of the anticipation of spiritual fulfilment. During the course of the 4th century this fasting period was extended to 40 days in commemoration of Jesus' 40-day fast in the wilderness; from then onwards it was known as the Great Fast (Lent). Also, by the 3rd century, Wednesdays and Fridays were designated as fasting days for Christians (in contrast to Mondays and Thursdays, which were fasting days for Jews). These days were chosen because they were days of mourning: Wednesday in remembrance of the betrayal of Jesus and Friday in remembrance of his death. To fast on Sunday, the day of Christ's resurrection, was prohibited since fasting and joy were regarded as antithetical. Three other main fasts were subsequently introduced, observed first in monastic communities and much later being commonly kept by clergy and laity also. These were the Apostles' Fast (ranging for one to six weeks before 29 June – the feast of SS Peter and Paul – depending on the year), the Assumption Fast (1–15 August), and the Christmas Fast (15 November–24 December). Apart from these four main periods of fasting, some one-day fasts were also established in the Orthodox Church: that of the Exaltation of the Cross, the Beheading of St John the Baptist, and on the eve of the Epiphany. It is worth noting here that in the first centuries of Christianity fasting became a necessary practice for neophytes before baptism. Finally, a complete abstention from food and drink is required by Orthodox Christians before receiving Holy Communion.

The Orthodox fasts are of two types (cf. Schmemann 1969): ascetic fast and total fast. The first refers to the abstinence from particular food and to a drastic reduction in food intake. It is a means of eschewing physicality in an attempt to achieve spirituality. Its purpose is to subject the body to privation so as to free the spirit from bodily desires, which are seen as the tragic consequences of the Fall: sin entered into the world through the act of eating and it is abstinence from food that would allow us to be redeemed. Thus, physical hunger and thirst should be redirected to a continuing hunger and an unquenchable thirst for God. Of all the ascetic fasts the most severe and the most rigorously observed by the laity is the Lenten fast. During this period one should abstain from meat, fish, all dairy products, oil, and wine. Unlike ascetic fast, which is long in duration, "total fast" lasts only for a day or even half a day and involves total abstinence from food and drink and from sexual relations. Total fast is the last and ultimate preparation before one is fed on Christ. It is a state of spiritual concentration and waiting that precedes the coming of the Kingdom of God. Fasting may also be viewed as a sacrifice. By

dying to bodily needs one symbolically offers one's body as a gift to God with the hope of salvation.

Fasting was also regarded by the Church Fathers as a necessary preparation for real prayer. Because of this connection with prayer, its rejection of bodily sensations, and its eschatological meaning, fasting seems essentially linked with monasticism. The dietary restrictions observed by monastics are more rigid than those imposed on the laity. There is a permanent abstention from meat. Apart from Wednesdays and Fridays, Mondays are also fast days for monks and nuns, on which only one meal, free from all animal products, oil, and wine (*xerophagia*, eating "dry food") is permitted. Athonite monks practise a total fast for the first three days of Lent, and take only a single meal (*monophagia*) on other fast days. As far as the laity is concerned, women normally fast more often and for longer periods than men, especially as they progress in age. In doing so they believe that they strengthen their own and their family's relationship with God.

Fasting in Orthodoxy is an act of unification and time-reckoning. It unites the soul with the body, the one who fasts with the divine, and also all Orthodox believers in the world in a shared action of alternate fasting and feasting.

Fate

The Greek words for fate – *moira*, *moros*, and *heimarmene aisa* – mean "portion". Apportionment is often said to be the work of gods, but the relation between fate and the other divine powers presented an acute problem to Greek thought. Usually a daimon is held responsible for an individual's allotted fate but often *moira* is the work of Zeus, the highest divinity of the Greek pantheon. Equally often *moira* appears to be determined independently of Zeus, and any interference with it amounts to upsetting the natural order of things (*Iliad*, 8. 70ff., 16. 435f., 22. 174f.). In this sense fate is regarded as being arbitrary and irrational, and therefore inexplicable and more powerful than the gods. A power closely similar to fate was fortune (*tyche*), and often, especially in later literature, the distinction between fate and fortune is vague. Although fortune can crucially affect somebody, originally its realm is that of chance, whereas the realm of fate is that of (godly) determination and strict necessity (cf. Aristotle *Nichomachean Ethics*, 1099b10–12). Throughout the history of Greek culture fate is seen as determining both sad and happy events with a power of universal law. Fate determines first and foremost death, and sometimes (e.g. in inscriptions) it is identical with death. The belief in the inevitability of man's allotted fate is of fundamental importance in Greek tradition and permeates Greek literature and thought from the Homeric age through the Classical and Hellenistic era up to modern times. It is striking to see that formulaic phrases and such terms as *moira* and *tyche* pervade all periods of Greek cultural history.

In the Homeric poems fate, *moira* or *aisa*, is neither a person nor a god or goddess but a fact. *Moira* appears in two forms: as a synonym for death, but also as signifying what is seemly or fit for someone, e.g. a share of honour. In its first form, *moira* is often found in formulaic phrases as the cause of death and destruction (*Iliad*, 4. 517, 19. 409–10, 23. 119). The hero frequently begs the gods for a reversal of fate (*Iliad*, 19. 287–302, 315–39) and often is able to reverse it or to worsen it by his own deeds (*Odyssey*, 9. 32f.), a situation described as *hyper moron* (beyond fate). In its second form *moira* reveals an ethical significance. One has to act and speak in accordance with one's own *moira*, taking into account social hierarchy, social and religious values, understanding of one's place and role in the social context.

Already in Hesiod fate becomes personalized in the figures of three old women spinning, the Moirai, the children of Night (*Theogony*, 219f.) or of Zeus and Themis (Righteousness) (*Theogony*, 904ff.); they were considered goddesses, able to "assign mortal men at their birth both good and ill" (*Theogony*, 217). Their functions are indicated by their names: Clotho spins the thread of life, Lachesis apportions destiny, Atropos makes final decisions. The Moirai appear in Greek iconography as early as the 6th century BC, and we know of the existence of their statues in various Greek cities, witnessing the cult of the Moirai. The power of Moira is stressed in the victory songs of Pindar and especially in tragedy. Aeschylus reserves a highly prestigious position for the Fates in the pantheon (*Eumenides*, 956f.), making even Zeus their dependant (*Prometheus Vinctus*, 511). The tragic heroes Ajax, Oedipus, Antigone, Philoctetes, and Alcestis lament their own fate and sing their own dirges. In Aeschylus'*Agamemnon*, Cassandra, endowed with the ability to prophesy, knows and laments her own fate and Agamemnon's.

The notion of *moira* plays a major role in funerary inscriptions and in the tradition of the literary epigram as well as in the magical papyri. A number of different formulae, many of them Homeric, are employed in funerary inscriptions to describe the work of Moira. Sometimes the deceased or the mourner directly addresses and reproaches Moira as the agent of their death. In funerary epigrams sentiments of grief are expressed for the inevitable action of Moira, especially when concerning premature death. From the 4th century Fortune

appears to supersede Moira, especially in some genres, such as comedy. The role of Moira and Fortune is highlighted in the stories of love and adventure of the Hellenistic and late antique novels. Fortune plays an active role in these novels as a personified agent, and dramatic tension is created by the innumerable reversals of fortune against which the heroes and heroines often protest.

The problem of fate appears from very early on in Greek philosophy. Parmenides maintained that fate determines that nothing exists but the being (fr. 8. 36–38). The problem of fate is first seriouly addressed by the Stoics. For them the way the world evolves is determined by a divine plan which includes our choices and decisions. Yet the divine plan is contingent on our own choices. Something can be dependent on us and still fated (but not necessitated) since a person's soul, together with external circumstances, is part of the network of fate. The human agent has power only over his or her own impressions. One may choose freely among them but whether one succeeds in realizing them is a matter of divine providence. Thus one is free if one does not desire anything beyond one's power (Epictetus, *Dissertationes*, 4. 7. 9). For the Stoics one exercises one's free will only when one gives assent to the right impression, but to act rightly or virtuously is not in one's power. The Stoic notion of fate was highly influential but was also polemicized by the Epicureans who denied the existence of a godly imposed fate (*D.L.X.*, 133–134). They argued that to the extent that men are rational their actions are voluntary, in the sense that they are under rational control. Later Alexander of Aphrodisias in his *On Fate* (*c.* AD 200), which argues that the Stoic view seriously restricts freedom.

In late antiquity the problem of fate and predestination was much debated among pagans and Christians alike. Gnostic sects, for instance, maintained a strict determinism, holding that salvation is reserved only for the chosen ones. The Christian Fathers were opposed to the pagan notion of fate, and the pagan view of astral determination. They maintained that everything is directed and guided by God's will and there is no room for an impersonal force like fate or fortune to be the agent of anything. The difficulty of this position is twofold, namely that God is the cause of evils and also that God is responsible for discriminating among humans, endowing some of them more and some of them less. From very early on, Christian Fathers stressed the human free will and Origen argued that man is created free by a just God who made all humans equal. The Christian notion of free will, like the Stoic one from which it springs, is shaped by a particular notion of freedom. Our freedom consists of acting in the way that God wishes us to act. Acting against God's will, we do not display our free will but our subordination to passions.

In the Byzantine period the image of fate has an important presence in both literature and philosophy. Fate remained a philosophical problem to which the Byzantines devoted special attention. The question of the extent to which human life is predestined, what is the realm of free will, and how this is compatible with God's foreknowledge of everything was vividly discussed by Maximos the Confessor and John of Damascus. Photios (9th century), Nicholas of Methone (12th century), and Nikephoros Gregoras (14th century) also dealt with the problem. In the Byzantine novels of the 12th and 13th centuries the picture is very much the same as in the ancient novels. At the same time a folk image of fate makes its appearance. In *Kallimachos and Chrysorrhoe* (1329–46) Tyche appears in the guise of a beggar woman dressed in black, a picture occurring also in folk tales. We also encounter the idea of the thread woven by Fate the Spinner or the decree of Fate, written down at the birth of a child, the *moirographema*, as it is called in *Kallimachos and Chrysorrhoe*, *Belthandros and Chrysantza*, and *Libistros and Rhodamne*, and other novels. Folk tales mention the records of *moira*, and even today Greeks use the expression "it was written" to indicate the inevitability of an event. In the 15th century the philosophical discussion of the problem of fate was revived. Plethon in his treatise *On Fate* maintains a strong determinism, arguing that God's will was a fixed law. In reply Theodore Gaza attacked Plethon, arguing that both Plato, whom Plethon invoked, and Aristotle allowed for human free will.

In modern Greece the belief in fate survives despite its obvious contradiction of Orthodox Christian doctrines. The role of fate is crucial in folk poetry. In folk tradition the Fates are depicted as three old women, of whom one at least is engaged in spinning, another holds a book with records of the decrees of people, and the third carries a pair of scissors to cut the thread of life. In many fables the Fates are said to present themselves after the birth of a child to determine its destiny, a motif which can be traced back to antiquity (e.g. Pindar, *Olynthian Odes*, 6. 42, Plato, *Symposium*, 206d). We also find the belief that the Moirai can change their minds if they are offered various gifts and prayers. A widespread popular tradition has been that of *Moirologia*. These are songs lamenting the dead, sung by women over the dead body or the tomb, recounting and blaming the work of the merciless Moira.

Federal States

The federal state was a major form of organization of the ancient Greek state. Its main characteristic was the union of various city states or tribal communities to form a single entity, which exercised certain political powers on behalf of its member states. By definition, the constituent parts of federal states enjoyed a specific degree of autonomy, including local government and the use of local citizenship, while the federal authorities were genuinely concerned with foreign policy. Political participation of the member states was achieved by the means of equal or proportional representation. Federal states were always founded on the basis of earlier Greek tribes – for instance the Boeotians, Arcadians, Achaeans (see below) – as a consequence of which tribal cults and ceremonies continued to play a prominent role in federal affairs. There is no single term to denote a federal state in ancient Greek. In the 5th and 4th centuries BC the term *koinon* is predominant, while in the Hellenistic period *ethnos* and *sympoliteia* are found.

One of the earliest – and one of the most important – federal states was the Boeotian League. Its chief officials, the Boeotarchs, appear to have been established by 519 BC, when Boeotian troops tried to incorporate Plataea into the Theban-led confederacy. Due to Theban Medism (support for Persia) in 480, the federal state was weakened after the Persian Wars. There was no official dissolution, but its political influence seems to have perished, and Boeotia came under Athenian domination in 457. A new confederacy was founded after the liberation from Athens a decade later, its polity being the best-attested form of representative government in antiquity. All Boeotia was divided into nine (in 427 extended to 11) electorate units, each of which provided one Boeotarch, 60 councillors, 1000 hoplites, 100 horsemen, and a certain number of jurors to the federal government. Active citizenship was confined to those who served in the federal troops (eligibility established by a so-called hoplite census). The constituencies were shared among the poleis according to their population. Both Orchomenus and Thebes were permitted two districts in 447, while smaller cities administered one or sometimes only a third of a district. In 386 the Spartans dissolved the federation on the grounds of the King's Peace. The League was soon re-established in the aftermath of the Theban revolution in 379. Its main political institution was the board of Boeotarchs, now reduced to seven. The representative councils were not revived. Instead, decision making rested with the primary democratic assembly in Thebes, which was open to all Boeotian citizens. Theban leadership soon became overwhelming. After the destruction of several poleis (most notably Orchomenus in 364), Boeotia was dominated by the Thebans alone. The sources tend to speak of the league in terms of a Theban *synteleia* (subordinate group), which indicates an amalgamation of polis structures and federal institutions. The confederacy was maintained in the Hellenistic age (despite the destruction of Thebes by Alexander in 335 BC), though its constitutional outline profoundly changed. At the head of government stood a board of seven (sometimes eight) Boeotarchs, who now were confined to one representative from any specific city. Next to them, the office of a military *strategos* (general) and a federal *synedrion* (council) were introduced. Another important improvement was the practice of taking the vote in the federal *synedrion* by cities. Effectively, no single polis seems to have dominated the federation until it was dissolved by Rome in 146 BC. In later periods the Boeotian *koinon* obtained cultural functions, such as hosting religious festivals.

In the north the Thessalian League was the leading federal state. It seems to have been established by the beginning of 5th century BC, emerging from the feudal kingdom of Thessaly. Its proper territory was divided into four tetrads (Thessaliotis, Phthiotis, Pelasgiotis, Hestiaeotis), each headed by a tetrarch. Initially, the office was monopolized by local aristocratic families (for instance the Aleuads of Larissa), who owned the vast majority of the Thessalian *kleroi* (land lots). Of these, each *kleros* was required to furnish 40 horsemen and 80 hoplites to the federal troops. With the growing importance of the *koinon*, the tetrarchs were replaced by four annual polemarchs. They were elected by the federal primary assembly of all free Thessalians. Like the polemarchs, the *tagos* (the head of state), was elective. His office embodied the supreme sovereignty of the league. However, the sources attest certain *atageiai*, which implies that there were substantial periods without a *tagos*. In the 4th century several tyrants of Pherae, most prominently Jason, sought to establish a lasting *tageia* over Thessaly. In resistance to their attempts, the league appealed to Philip II of Macedon, who was elected as federal archon and defeated the Pheraeans in a pitched battle in 352. Under his archonship the Thessalian League soon became a Macedonian protectorate. The tetrarchy was reintroduced, its officials being appointed by Philip. Further, he initiated a system of "decarchies" (boards of ten) in each of the cities, to anchor Macedonian interests. The next major reform was enforced by Flamininus in 194. The league, now detached from Macedon, obtained representative government, including a federal *synedrion* of city delegates. Apart from judicial and deliberative activities, its main objective was the annual election of the head of government, the *strategos*. Unlike most confederacies, this polity was officially maintained throughout the Roman empire, affiliated to the province of Achaea.

The Arcadian League presents a much shorter history. Founded after the Battle of Leuctra in 371, it was brought about by Mantinaean and Tegean democrats, who sought to unite their poleis against Sparta. To prevent rivalries between these prominent member cities, Megalopolis was founded as a new federal capital. The central political body was the primary assembly, the *myrioi* ("ten thousand" – that is, "all") in Megalopolis. This assembly was attended to a large extent by members of the federal army, the *eparitoi*, a mercenary force paid by the confederacy. At the head of the troops stood the *strategos*, the federal commander-in-chief. The most interesting institution was the federal *boule* (council) of 50 *damiourgoi* (councillors), who represented the cities approximately in proportion to their population. Despite this sophisticated combination of direct and representative bodies, the Arcadian League was soon crushed by internal civil strife and disintegrated in 364/63.

More successful was the Aetolian League, which – as well as its great opponent, the Achaean League – played a major role in the politics of Hellenistic Greece. Its origins can be traced back to the late 5th century BC, when Aetolia initially established some sort of federal government. The *koinon* had both tribal and city members. Foreign policy was in the hands of the

federal state. The confederacy held two annual meetings (*Thermika* and *Panaitolika*), to determine the league's policy and to elect military commanders. As early as 327, a federal *boule* is attested, and it is clear that this council served as the administrative body. This constitutional framework was the basis for further development of the federal state in the 3rd century, when its territory expanded considerably. While maintaining a remarkable degree of local autonomy, new members (such as the Lokrian district) were conceded an equivalent status to the genuine Aetolian tribes and cities. More distant members were granted the status of *isopoliteia* (state with reciprocal civil rights). Consequently, the federal council soon grew from its original extent to a size of possibly up to 1000 representatives. For practical reasons, a certain number of these served as executive councillors (*apokletoi*). The chief magistrates were the *strategos* and the *hipparchos* (cavalry commander), both elected by the federal primary assembly in Thermon. In the 2nd century BC the Aetolian League increasingly came under Roman power. After the reduction of its territory to Aetolia proper in 167, the federal state lost its sovereignty and was finally incorporated into the province of Achaea under the principate.

The federal constitution of Achaea goes back to the 5th century BC. The early confederacy appears to have been divided into 12 *merea* (units), each of which sent a contingent of delegates to the federal board of *damiourgoi* and to the oligarchic assembly at Aigion. By 389 the league had adopted a system of double citizenship: in that year the *koinon* incorporated Naupactus on the north coast of the Corinthian gulf by granting federal citizenship to its inhabitants. After 324 the league seems to have been broken up by Demetrius, but it was revived in 281/80 on the initiative of four Achaean cities (Pharae, Dyme, Tritaea, Patrae). The newly established federal state soon rose to great prominence. From 251, when Sicyon joined, the league gradually expanded and finally embraced the whole of the Peloponnese. Its main political body was the representative council, the *synodos*, assembling at Aigion. Additionally, there existed a federal primary assembly, the *synkletos*, which was concerned with extraordinary business. In both the *synodoi* and the *synkletoi*, votes were taken by individual cities. The league's executive rested with the annual board of ten *damiourgoi* and two *strategoi* (after 255 BC reduced to one). Election took place in the *archairesiai* (election meetings) of the Achaean citizens. With Roman support, the federal state became the most important single power in mainland Greece in the 2nd century BC. However, economic crisis and class struggle soon led to strained relations and to open resistance against Rome. In 146 the Achaean federal state was dissolved by Lucius Mummius. Like the late Boeotian *koinon*, it continued to serve as a community for cultural and religious ceremonies, until the province of Achaea was established in 27 BC.

Festivals

Antiquity

In a society that did not have the modern system of weeks – and accordingly, weekends – regularly recurring festivals offered opportunities not only for repose and entertainment, but also for maintaining contact with one's fellow citizens, and, on a more practical level, for eating meat. It is estimated that more than 60 days out of the Athenian year of 360 days were given over to festivals, when normal business – at least of an official nature – was suspended (the equivalent of our bank holidays). This compares well enough to modern western practice.

The Greek word for festival was *heorte*, which was used for most communal celebrations with a religious component. This would involve a sacrifice, conducted usually in the deity's sanctuary. This meant that the sacrificial beast had to be brought to the place of sacrifice, a requirement that easily developed into

a procession (*pompe*), sometimes very elaborate, in which the beast was accompanied by the priest, the butcher, other cult and public officials, and the public. The Heraia of Argos, for example, began with a procession that led from the city across the Argive plain to the Heraion, which served to demonstrate to the people of the Argolid, and remind them of the fact, that the Argolid belonged to Argos.

The essential feature of any festival was the actual gathering of people to participate, and, depending on the nature of the celebration, to watch. The supposed birthdays of gods and heroes were marked by celebrations, monthly and/or annual. Many festivals marked stages in the agricultural cycle. Such was the basis of the various Dionysiac rites celebrated during the late winter and early spring, to signal – and in some cases to stimulate – the reawakening of plant and animal life after the rigours of winter: Lenaia, Dionysia, Thyia, Agrionia. Similarly, the successful growing of grain was the goal of a whole series of rituals focused on Demeter and Kore Persephone, the most notorious of which were the Thesmophoria, a rite restricted to women.

There were other rites in which participation was restricted. These included festivals devoted either wholly or in part to the initiation of new members into a relatively closed community. Mystery rites – *teletai* – are one example of this kind of festival. The best known were those at Eleusis and Samothrace, which admitted initiates regardless of citizenship. Then there were the various rites of passage from one age group to another in the course of progression from childhood to full citizenship, which were part of larger local festivals. Thus at Athens one day of the Apatouria was given over to the admission of ephebes to the status of manhood, while something similar lies behind the confused rituals of the Spartan *agoge* (education system).

Festivals might range from relatively simple commemorations to full-scale celebrations, with formal procession, sacrifice, competitions (*agones*), and an attendant market and fair (*agora*). The inscription that sets out the arrangements for the festival connected with the celebration of the mysteries at Andania in Messenia is a mine of information. It dates from 92 BC, when one Mnasistratos, to whose family the operation of the mysteries had been entrusted in the past, turned over the operation of the cult to the state. We learn that, in addition to the initiatory ceremonies proper, there were extensive public celebrations. The sanctuary was out in the countryside, and arrangements had to be made to house, feed, water, bathe, and police the multitude who came. All we are really told about the mysteries is that new initiates were sworn in by former initiates – male and female – and that all of them had to dress in specific kinds of clothing. The "open" festival included a procession in which all the officiants as well as the priests and priestesses of other sanctuaries in the region took part, and in which sacrificial beasts were escorted. There was a sacred feast from the meat of the sacrificed animals, and performances of music and dancing. Close attention is paid to the regulations for the market, which was clearly an important feature of the festival. The whole – festival, mysteries, market – was open to men, women, children, free or servile (indeed, an area was set aside for slaves to seek refuge).

The term *panegyris* (an Aeolic form meaning literally "gathering of all") is reserved for festivals with a wider than purely local appeal. It appears in a fragment attributed (possibly falsely) to Archilochus, which refers to a *panegyris* of Demeter and Kore (fr. 322 West). An early description of such a festival – although it does not employ the actual word – is the gathering of Ionians with their children and wives on Delos, where, according to the author of the *Homeric Hymn to Apollo*, they regularly delighted the heart of the god with competitions in boxing, dancing, and song. The festivities also included hymns sung by the girls of Delos in honour of Apollo and Artemis and their mother Leto.

From the other end of antiquity we have a long inscription from Oenoanda in Lycia, dating from the reign of Hadrian, which records the foundation of a *panegyris* by a local tycoon (Caius Julius Demosthenes). The document gives a detailed account of the programme of events of a musical and theatrical (thymelic) agon. The festival was spread over 22 days beginning on the first day of the month (in high summer) with a competition for trumpeters and heralds (essential features of any festival: the victorious trumpeter would summon the multitude, the herald would announce the programme and dispense other information). The second to fourth days were reserved for public business: meetings of the council and assembly of the polis. The first competitions proper (the sequence and range of competitions are more or less identical in surviving victors' lists from all over the Greek-speaking world) were held on the fifth, when composers of prose encomia (probably in honour of members of the imperial family and important local people) competed. The sixth day was given over to the market. On the seventh day epic poets competed, on the eighth and ninth aulos players with chorus, and on the tenth and eleventh comic poets. On the twelfth day of the month there was a sacrifice to Apollo Patroos (patron god of the polis), followed on the thirteenth and fourteenth by the competitions of tragic poets, and on the fifteenth by a second sacrifice to Apollo Patroos. Singers with cithara accompaniment competed on the sixteenth and seventeenth days, and the agon proper ended on the eighteenth with a final open competition for all (perhaps all the victors in preceding competitions). For all these, prizes were awarded, in most cases to those who finished second as well as first. From the nineteenth to the twenty-first, hired mimes, singers, and other entertainers performed, but not in competition, and finally on the twenty-second day there were gymnastic events open to citizens (the inclusion of a few athletic competitions in musical festivals – and vice versa – is not unusual under the empire). During this *panegyris*, which took place in the theatre, the agonothete (president of the competition), priests, functionaries, civic dignitaries, and representatives from surrounding towns and villages processed through the theatre, and each individual group sacrificed according to a fixed schedule. There were penalties for non-participation.

The earliest competitive festivals (*agones*) we read of are the funeral games in honour of Amphidamas of Chalcis, presumably a real person (Hesiod, *Works and Days*, 650–59), and the fictional games for Amaryntheus of Epeia (*Iliad*, 23. 629–45) and Patroclus, the last vividly described in *Iliad*, 23. 297–897. Such games would naturally have been casual occasions, but they provided the model for games celebrated annually in honour of heroes. The Herakleia were celebrated at about the time of the winter solstice, when the people of Boeotia

performed public rites in honour of those who had died in the service of the state.

The best-known ancient Greek festivals were the four great Panhellenic gatherings at Olympia, Delphi, the sanctuary of Poseidon at the Isthmus of Corinth, and the sanctuary of Zeus at Nemea. Each of these sanctuaries was well placed to be a centre for an interstate festival: Olympia was at the confluence of the rivers Cladeus and Alpheus, and, as its name reveals, it was at the southern end of a land route used by rranshumant hersdmen, linking the Peloponnese with the north and north-east of the Greek mainland, where Mount Olympus looms. Similarly, Delphi is at the southern end of an overland corridor joining the north to the Gulf of Corinth. Both Olympia and Delphi were also easily accessible by sea to the Greek settlements in the west, a fact that greatly accelerated the pace and extent of their growth from local to interstate/Panhellenic meeting place. Isthmia is at the southern end of the portage across the Isthmus, which linked the gulf of Corinth and the Saronic gulf. Nemea, although at first glance of lesser importance, in fact lies astride a major north–south land route in the Peloponnese.

All of these festivals – Olympia, Pythia, Isthmia, Nemea – began as purely local operations. The first to attract a wider clientele was Olympia, where the list of victors in the stadium race begins at 776 BC, a date that more or less matches the archaeological record. The Olympian games probably began relatively simply, with the foot race, other competitions being added as time passed. During its early years the Argives and Spartans were major patrons; in the early Classical period much interest was shown by rich and powerful Hellenes from Sicily and southern Italy. The Pythian games traditionally began with a single competition, the performance of a hymn in honour of Apollo. By early in the 6th century BC (traditionally after the so-called First Sacred War), the Pythia, which had originally been celebrated at intervals of eight years, had become, like the Olympic games, pentaeteric, that is, they were celebrated every four years (every five by the inclusive reckoning used in antiquity). Furthermore, athletic contests were added to the musical ones (the Olympic games, on the other hand, remained strictly athletic). Delphi too attracted the patronage of Sicilians and Italians. At about the same time – *c.*582 BC – the Isthmian games became Panhellenic, to be followed a few years later (*c.*573 BC) by the Nemean games. Both the Isthmian and the Nemean games were trieteric, celebrated every second year. The Isthmia were originally athletic only, with musical competitions being attested from the 3rd century BC. The Nemean games included both musical and athletic contests. The games of the cycle – the *periodos* – were preceded and followed by a Sacred Truce, so that competitors and visitors might have safe passage to and fro (not so much a "truce" as we know it, rather an agreement not to seize the persons or property of people travelling to and from the site of the festival: in later antiquity these arrangements were not limited to the Periodic games). Olympic and Pythian games were held at the same time of year (late August/early September) with a two-year interval between them; the Isthmian games were held in April/May of every Olympian/Pythian year, and the Nemean games in July of every off-year, giving, for example, the following sequence for an Olympiad: 488 BC Olympia and Isthmia; 487 BC Nemea; 486 BC Pythia and Isthmia; 485 BC Nemea; 484 BC Olympia and Isthmia.

These contests were what was later called *stephanitai*, that is, the prize for victory was not monetary, but in the form of a wreath (*stephanos*), of wild olive for the Olympia, bay leaves for the Pythia, pine, later dry celery for the Isthmia, and fresh celery for the Nemea. Victors in these games could count on receiving more material rewards at home, in recompense for the glory they brought their communities: at Athens, for example, victors at the Olympic games (at least those well enough off to have entered a horse or chariot) were fed at public expense in the Prytaneum. The glory of such victories is also reflected in the epinician odes commissioned from such poets as Simonides, Bacchylides, and Pindar.

The polis of Elis was responsible for the Olympic games. The Pythian games, like the Delphic oracle, were governed by a genuine interstate body, the Delphic amphictyony. The Nemean games seem to have begun as a festival shared between the towns of Cleonae and Phlious, but eventually came under the control of Argos. The Isthmian games were Corinthian, except during the period 146–44 BC when Corinth lay in ruins and the direction of the games was assumed by Argos. (Argos became one of the two headquarters – the other being Thebes – of the guild of actors and musicians called the "Isthmian and Nemean Artists of Dionysus": these Hellenistic guilds – the other major associations were the Athenian guild and the guild of artists of Ionia and the Hellespont – ensured the participation of professional competitors at agons great and small.) Despite the fact that three out of four of these festivals were run by a single state, all four reached and held the status of interstate, Panhellenic festival, probably because they were clearly tied to the rural sanctuary in which they were held, rather than to the state itself. By contrast, the Panathenaia of Athens, founded or expanded in the 6th century BC, which included both musical and athletic contests, and for which huge amphorae were given as prizes, never reached true Panhellenic status. This was probably because they were too closely linked with Athens: the name itself was a form of propaganda.

A significant change in the world of Greek competitive festivals came with the institution of the Soteria at Delphi, first founded to celebrate the defeat of the Gallic invasion of 279/78 BC, and in the mid-3rd century BC refounded as a pentaeteric festival of Panhellenic pretensions by the dominant Aetolian League. This started a veritable flood of new festivals, many of them pentaeteric, throughout the Hellenistic world, whose organizers sought acceptance of their new or enhanced status from the Aeolian-controlled Delphic amphictyony, as well as from any other political power that would grant it. The main attraction of these games for competitors was the prizes, usually in the form of wreaths of gold or silver. The holding of such a festival and its acceptance became an important feature of international relations during the Hellenistic period, and it is probably true to say that these festivals were one of the most powerful instruments in fostering and maintaining Hellenic identity in late antiquity.

Modern Times

The festivals of the modern Greek year reflect the needs of the changing seasons, as did many in antiquity, but now within the framework of the Orthodox Church. Again, as in antiquity, there are many local variations, as well as celebrations that might truly be called Panhellenic. A good example is the series of rites over the 12 days of Christmas, which include mummers' shows and rituals aimed at averting evil spirits. Many of the festivals are concerned with ensuring the fertility of crops, kine, and mankind, and there are numerous occasions on which the graves of the dead are visited and adorned. These rites and others recall ancient practice, and it is possible, in specific cases, to identify a modern festival with an ancient predecessor; here and there even animal sacrifice survives. But all this is at a local level, and it would be wrong to posit any system of direct survival. What has survived are not the individual festivals, but the underlying Hellenic preoccupations with physical well-being in a difficult environment, spiritual comfort in an uncertain world, and survival of the *ethnos* (nation). The Church has been the great unifying factor, both at the Panhellenic level and locally, where a multitude of saints (many of them multi-faceted) has assumed the age-old function of local heroes.

The modern festival year follows the agricultural seasons, beginning with St Demetrius' Day (26 October), which coincides with the opening and tasting of the new wine. This precedes the sowing of the main cereal crops, the midpoint of which is marked on 21 November by the festival of the *Eisodia tis Theotokou* (Entry of the Virgin). The festivals of the *Dodekameron* (the Twelve Days), from 12 December to 6 January , include feasting on Christmas Eve, special tending of the graves of the dead, rites to avert the evil spirits (*Kallikantzaroi*), and others to welcome the new year under the auspices of St Basil. It ends with Epiphany, the day of Christ's baptism, which signals a new beginning and is in many places accompanied by the opening of new wine.

The three-week period preceding Lent is the season of Carnival (*Apokreos*). There is much feasting, and the performance of masquerades by wandering groups of players, which recalls the rustic *komoi* of ancient Attica. The 40 days of Lent are punctuated by rites to honour the dead and commemorate the triumph of the faith. At the same time, the beginning of March is regarded in many places as the real beginning of summer and so celebrated, and of course 25 March, Independence Day and Feast of the Annunciation, is a special national festival throughout the Greek world.

Easter rites abound from the day before Palm Sunday over Easter itself and throughout the entire following week. Another Panhellenic day of celebration is 23 April, St George's Day, marked not only by the usual festivities but also by athletic games. May Day is celebrated as a festival of spring, symbolized in many places by a maypole procession. But the most important festival in May is the *Anastenaria* (21 May), the feast of SS Constantine and Helena: among the highlights are processions, dancing, and the sacrifice of bulls and rams.

The month of June is given over to the harvest, and consequently there is little time for elaborate festivals, although rituals aimed specifically at the harvest are conducted: 24 June, the birthday of St John the Baptist, is celebrated by the lighting of bonfires. July is the month of threshing, and this too has its special rites, but the major festival is that of the Prophet Elijah on 20 July. Many of his rites take place on mountain tops, and it is clear that the prophet has inherited characteristics of Zeus (the farmer's god) and Helios (the sun god). The main festival of August is the Dormition of the Virgin Mary (15 August), a time of pilgrimage, while September brings both the vintage and the Exaltation of the Cross (14 September), which is the turning point from one agricultural year to the next.

Finance

Finance is the process by which individuals or groups collect and expend funds. This article focuses on governmental revenue and expenditure.

The earliest preserved financial documents from Greece are records of inventories and payments dating to the Mycenaean period (*c.*1600–1100 BC). Mycenaean Greece was organized into kingdoms staffed by officials who collected mandatory contributions from the king's subjects. Payments were made "in kind", i.e. in the form of produce such as grain or objects such as axes. Some of this revenue was used to support the royal household and the military. The remainder was redistributed to the kingdom's subjects in proportion to each individual's position in the political hierarchy.

After the collapse of Mycenaean civilization, both government and finance were greatly simplified. A king with strictly limited powers drew revenue from a piece of public land called a *temenos*, the produce of which was given over to him as long as he held power. Significant gains were also won through war and piracy. The king's financial responsibilities included funding military and religious activities and the entertainment of local nobles and foreign visitors.

Around 800 BC more complex state forms emerged. A sense of the different kinds of financial arrangements which were found in Greece thereafter can be had by looking at three

examples: Sparta, Athens under Pisistratus, and Athens under democratic rule.

The Spartan state was controlled by a military elite, the members of which neither worked nor paid taxes. They were supported by serfs called helots who tilled the estates of the elite and who were required to provide specified amounts of various foods to their master's household. No other regular taxes existed except for small gifts made to the kings. This remarkable absence of taxation was possible because governmental apparatus was minimal. The lack of revenue sources was, however, a problem in wartime when military expenses had to be met, sometimes only with difficulty, from the contributions of Sparta's allies, from the sale of booty, and from voluntary offerings by Spartan citizens.

Athens under Pisistratus presents a very different picture. Pisistratus became sole ruler (tyrant) of Athens in 546 BC. The primary source of revenue for his government was a tax on agricultural produce. State expenditures included the maintenance of police and military forces, the completion of a substantial building programme, and the celebration of religious ceremonies. A key feature of this financial system was the imposition of a direct tax on all inhabitants of Athens. (Direct taxes are levied on an individual's income or personal wealth. Indirect taxes are levied on services or transactions. Income taxes are an example of the former, sales taxes of the latter.) The obligation to pay direct taxes was seen as a form of subservience and thus as a sign of despotic rule.

The democratic government which came to power in Athens in 514 BC kept elaborate records, many of which are preserved. These, along with contemporary literary sources, provide unusually detailed evidence about financial practices.

The revenue of the Athenian state in the mid-5th century BC came from five sources: rents on state property, indirect taxes, direct taxes, tribute, and liturgies (see table). While indirect taxes were paid by all Athenians, direct taxes were normally paid only by resident aliens, each of whom was required to pay a yearly fee (a "head tax"). The Athenian state also derived revenue from the tribute it extracted from its allies. (Liturgies are discussed below.)

Revenue Source	*percentage of Revenue Supplied*
Rents on State Property	15
Indirect Taxes	15
Direct Taxes	5
Tribute	50
Liturgies	15

The revenues of the Athenian state were expended as follows. About 35 per cent of the total was used to support the military. Public works, particularly the massive building project which produced the Parthenon, consumed another 20 per cent. The internal administration of Athens involved the paid participation of thousands of citizens and thus resulted in heavy expenses for jurors (12 per cent) and for various other officials (7 per cent). Expenditures for religious ceremonies (10 per cent), for the support of orphans and invalids, and for the police force (about 6 per cent each) made up most of the rest.

In wartime, expenses increased significantly; this frequently put Athens in a difficult financial position, and upon occasion an emergency property tax (*eisphora*) was levied on all residents including citizens.

The administrative machinery which organized Athenian finance was quite simple. Governmental budgeting – projecting and adjusting total future revenue and expenses – did not make its appearance in Greece until the 19th century AD. All earlier governments administered their finances through "earmarking"; the proceeds of individual sources of revenue were kept in separate funds each of which was used to pay for one or more predetermined types of expenditure. This union of taxing and spending is reflected in the institution of liturgies. Many tasks of the Athenian state, including such items as the maintenance of warships, were carried out by assigning the task to a wealthy citizen. The liturgist was legally bound to supply all necessary expenses to complete the assigned project.

Of the three financial systems discussed above, the one used by Pisistratid Athens proved to be the most durable. The financial organization of the kingdoms which ruled most of Greece after the 4th century BC closely resembled that of Pisistratid Athens, despite obvious differences in scale. Revenues came from a direct agricultural tax on the entire population and were spent largely on maintaining the military and the leader's entourage.

This pattern of taxation and expenditure was remarkably persistent, existing well into the 19th century AD in spite of numerous changes in Greece's political situation. The revenues of the Byzantine empire were drawn primarily from direct imposts in the form of a land tax and a head tax. Of this revenue 80 per cent was expended on the military with most of the rest going to pay for public buildings, ceremonies and games, and the upkeep of the royal court. The Ottoman Turks made only minor changes in the system which they found in operation when they seized control of Greece in the 15th century. The same can be said of the various parties who ruled Greece in the first years of independence.

It was only in the 19th century that substantive changes in patterns of revenue and expenditure were implemented. The establishment of a national government organized along western European lines led to more thoroughgoing oversight by the state, beginning with a board of financial control (created October 1833).

In spite of the fundamental changes in the financial system of Greece which took place after the end of Turkish rule, a strong element of continuity with ancient practice is observable today. With the achievement of independence, a distaste for direct taxation resurfaced. The close parallel to the cessation of direct taxation on citizens in Athens after the establishment of the democratic government is significant. Direct taxation was associated with Turkish rule and was largely suppressed in favour of indirect alternatives. This predilection for indirect taxation continues to influence the financial practices of the Greek state. About 65 per cent of the national budget (excluding social insurance) is provided by indirect imposts whereas most European states derive the majority of their revenue from direct taxes.

Fire, Greek

Although "Greek fire" was never called by that name by its Byzantine originators, who referred to themselves as Roman, this appellation was adopted centuries ago (though exactly when is uncertain) to describe the Byzantine naval superweapon, used from the late 7th century until the empire fell in the 15th century, that consisted of a flame that was "thrown" from a pipe at the front of a ship. Although its exact composition is unknown, sources agree that – like modern-day napalm – Greek fire was capable of burning on water and would cling to any available surface, and that it was virtually inextinguishable except by means of sand, vinegar, or urine (which contains phosphates).

J.R. Partington, the foremost 20th-century authority on Greek fire, has suggested that the liquid used to produce this effect was probably rectified petroleum or volatile petrol, with resins or solid combustibles dissolved in it to thicken it to a jelly. Thickening increased the range of projection and the stability of the flame when it was shot through a leather or bronze hose. Sources disagree about its exact nature, but either the liquid ignited spontaneously upon contact with water or a small flame at the hose's mouth would light the material as it streamed past. A double-action pump on board the ship would keep the stream moving steadily.

Incendiary weapons were well known to the ancient world, and were often used in land warfare. Naphtha (naturally occurring petroleum) was contained in breakable containers, set alight, and tossed at the enemy, though this procedure does not seem to have enjoyed common usage until after the time of Alexander the Great. The first hint of something similar to Greek fire was described by Aeneas Tacticus around 360 BC. He described a mixture of pitch, sulphur, pine shavings, and incense or resin, and mentions that pots of the material were often thrown on to the decks of wooden ships. Pliny the Elder was struck by the fact that a mixture of quicklime with an inflammable substance such as naphtha will inflame spontaneously when wetted. In fact, anhydrous quicklime is a compound that can bind chemically with water to make another compound, forming molecular bonds to make up a crystalline structure called a hydrate. In the process of hydration it gives off heat. When the hydrate form is heated, energy is absorbed in breaking down the chemical bonds, and when the dehydrated form is again wetted, heat is given off when the crystalline structure reforms. The heat could then ignite the petroleum. This reaction may be the base of the story of Medea's assassination of the Corinthian princess Glauke by offering her a garment that burned her to death when she put it on: Medea's homeland, Colchis, has abundant naphtha resources.

Theophanes claims that the inventor of Greek fire as a naval weapon was Kallinikos, a Syrian from Damascus who sold the secret to the Byzantine emperor Constantine IV sometime around 672. Sources disagree about exactly what it was that Kallinikos sold; it might have been the formula for the mixture, or the method of shooting the mixture out of a siphon mounted on a ship's prow. When Muslim forces besieged Constantinople in 673, they were met with this devastating new weapon. In the year 680, at the Battle of Cyzicus, the Byzantine navy burned the entire flotilla of Syrian and Egyptian ships, and the seven-year siege was broken: the Muslims signed a 30-year truce. As the historian Aziz S. Atiya puts it, "The spell of the invincibility of the Arab broke down at the gates of Constantinople."

Both Arab and Greek sources agree that this weapon surpassed previous incendiaries in its destructive and demoralizing capacities, and the powerful effect of its introduction has been compared to the introduction of nuclear weapons in 1945. Since there are records of the Muslim forces using some form of Greek fire with catapults in combat as early as the year 683 (by the general Ibn 'Uqbah, at Mecca) and throughout the crusades, the military secret clearly applied to its use in naval combat only.

It might seem surprising that a Syrian would be willing to sell out his own country to the Byzantine empire until one remembers that Damascus had been a part of the empire until the city was taken by the Arabs in the year 635, and Syria itself was not conquered until the following year. Public accounts were still kept in Greek until the dawn of the 8th century, and Syrian society, after 1000 years of Graeco-Roman domination, remained very Byzantine in flavour. Muslim incursions into Byzantine territory began in 633, in the wake of several years of war between Byzantium and Persia. Persia had taken Antioch and Damascus in 613, Jerusalem in 614, and Egypt in 619; the Byzantine emperor Herakleios defeated the Persians in 630 and took back the territory, but both empires had been severely weakened by the struggle. The Byzantine army in Syria, led by Herakleios's brother Theodore, was exterminated by Muslim forces six years later. Jerusalem became Muslim in 637–38, and Egypt followed in 641. In 655 the Muslim forces enjoyed naval supremacy, having trounced the Byzantines off

the coast of Asia Minor and captured the young Byzantine emperor Constans II. Constantine IV was Constans II's son, and thus was acutely aware of the need to strengthen Byzantium's naval forces when he purchased Kallinikos's invention.

Throughout the existence of the Byzantine empire the secret of Greek fire was guarded obsessively. The emperor Constantine VII (913–59) wrote to his son:

> If you are ever asked to divulge information about the making of liquid fire discharged through tubes, you must reply, "This was revealed by God through an angel to the great and holy Constantine, the first Christian emperor. And we are assured by the faithful witness of our fathers and grandfathers that it should be manufactured among the Christians and in their capital city and nowhere else."

In 941 Constantinople was again defended, this time against the Russians. According to Liutprand of Cremona, whose nephew was then an ambassador to Constantinople, the Russian flotilla of several thousand ships was defeated by 15 "semifracta chelandria" which threw liquid fire from prow, stern, and sides. The Russians hurled themselves from the burning ships; those weighed down by their armour were drowned, and those who could swim were burned.

To add to the awesome effect, Byzantine shipmakers designed the prows of the ships to look like the heads of ferocious animals, from which the Greek fire would issue. It has been suggested that its use against Viking invaders in the 10th century in this manner led to northern tales of fire-breathing dragons.

Because of its originators' obsession with secrecy, Greek fire was long thought to be a lost art. It seems, however, to have adapted into other forms and to have found its way into artillery and gunpowder. In the earlier stages of development Greek fire and cannon were sometimes used together. By projecting flammable substances instead of cannon balls, fires were started within the walls of siege targets. It was used in some form in almost all wars, up to and including World War I in 1917.

Fishing

The Mediterranean is an enclosed sea, consisting of deep basins with poor water circulation and therefore limited distribution of nutrients. Annual evaporation rates exceed replacement from rivers and as a consequence the sea is saltier than waters of the north Atlantic. Sea temperatures are lower and the important commercial fish stocks of the Atlantic, such as cod and herring, are absent. In general, the Mediterranean is lacking in fertility and, although evidence is not conclusive, this appears always to have been the case despite changes to sea level in the Pleistocene–Holocene transition.

Although the seas of the Aegean and eastern Mediterranean are less fertile than the waters of the north Atlantic, they support a wide range of species. Over 1500 species of marine invertebrate are reported for the Mediterranean as a whole, and around 100 of these are edible. In Greek waters 447 species of marine fish have been recorded, comprising important pelagic species such as tuna, mackerel, and anchovies as well as a great variety of demersal species including the important families of Serranidae (grouper), Sparidae (sea bream), Labridae (wrasses), Mugilidae (mullet), and Scorpaenidae (scorpion fish). Numerous species of edible shark and ray exist, and turtles and marine mammals are also present. The variety of species means that fishermen are able to engage in diversified fishing and are not dependent on single species, whose stock levels may fluctuate annually and interannually.

A variety of fishing methods are recorded for antiquity, and archaeological evidence suggests that many of these methods go back into prehistory. Many of these fishing methods are still in use today. In the 2nd century AD the writer Oppian described four methods, namely the use of hooks, nets, weels (wicker basket traps), and tridents. Line fishing using hooks can employ a stationary line (as with the set line, the *paragathi*), a trolling line pulled behind a moving boat, or involve the use of a rod. Nets include simple nets (gill nets, cast nets, drag nets, and seine nets) or complex nets such as the three-walled *manomena*, a trammel net. The madrague (or *tratai*) is a specialized fishing method employed for catching tuna. A lookout alerts fishing boats to the arrival of a shoal of tuna and the fish are chased through a series of nets placed parallel to the coast until they reach a death chamber where they are gaffed. In the ensuing melee, many fish are killed by others in a frenzy. Aeschylus compared the slaughter of the Persians at Salamis to this fishing method. Weels, baskets, and pots are used to catch a range of fish and shellfish. Tridents were often employed at night with lights.

The earliest evidence for marine exploitation occurs at the littoral zone. Eels are generally caught by trapping and these

Fishing: fisherman mending his nets, one of 13,000 Greeks still fishing by non-mechanized methods

and demersal and littoral species dominate the earliest evidence during the Final Palaeolithic and Early Mesolithic. Evidence for the use of boats corresponds with the appearance of tuna remains, together with obsidian from the island of Melos, in Upper Mesolithic levels at Franchthi Cave in the southern Argolid. The two key sites for the prehistoric period are Franchthi Cave and the Cave of Cyclops on the island of Youra in the north Aegean. Youra has produced the largest known collection of bone fish hooks and fish gorges for any period in Greece. At both sites the proportion of fish remains in the total food refuse declines dramatically at the beginning of the Neolithic.

Iconography during the Bronze Age is an important source of information about fishing and marine exploitation. The Minoans and the residents of Akrotiri (Thera, modern Santorini) were fond of marine imagery and the fresco of the fisherboys at Akrotiri shows a mixed catch of dolphin fish (*Coryphaena hippurus*) and mackerel (*Scomber sp.*). The extraction of purple dye from the shellfish *Murex brandaris* occurs from Middle Minoan times. The set line or *paragathi* is also attested from Middle Minoan times, and lead weights that could well have been used for trammel nets date from the Late Bronze Age.

Homer's heroes did not eat fish, but whether this reflects a common practice or is simply an indication of the social status attached to various foods is unclear. The poems do, however, make mention of spears, nets, rods, and handlines which suggests that fishing was widely practised. The low status of fishermen is apparent in later periods, as they are commonly the object of jokes in comic theatre.

Classical Greece, or more particularly Athens in the 5th century BC, imported a broad range of foodstuffs, and expensive fish were part of the conspicuous consumption of the urban wealthy elite. Greek food consisted of staples like bread (*sitos*), drink notably wine (*poton*), and *opson*, the relish that accompanied these staples. The term *opson* survives in modern Greek as the word for fish, *to psari*.

Some of the most important "relishes" that accompanied food were fermented fish products such as *tarikos*, known to the Romans as *garum* or *salsamentum*. The earliest mention of salted fish is in the Hippocratic Corpus and the first mention of fish sauce is in Dioscurides, but Greeks no doubt ate salted and preserved fish well before these literary references. A 5th-century BC house at Corinth produced Punic amphorae, the sherds of which have preserved fish attached. Various species of fish and shellfish could be used in the process and the result is comparable with the modern Vietnamese fish sauce, *nuoc-mam*. No fish-processing centres have yet been excavated in Greece, although salting factories are known for the Roman period. Roman fish tanks are found in eastern Crete at Siteia,

Chersonisos, and Mochlos. Such facilities could have been used to breed or store fish, but at none of these sites is there evidence for associated salting facilities.

Greece continues to have the most artisanal of all the fisheries of the European Economic Union. In 1990 full-time professional fishermen numbered around 20,000. Of these, 13,000 were involved in small-scale and local fishing, employing mainly artisanal, non-mechanized fishing methods. Besides these statistics on professional fishermen it is important to note that since 1970 catch and employment statistics have not included vessels with a motor of 19 horsepower or less, yet such boats are estimated to number approximately 12,000 and have an average monthly production of 150–200 kg per vessel. Accurate catch data are therefore difficult to obtain, but for the official statistical group of fishermen the total catch for 1990 was 112,202 metric tons. Key species in this catch included anchovies (14,668.6 metric tons) and pilchards (11,053 metric tons). Although 55 species were identified, 11,451.7 metric tons of the annual catch is simply recorded as "other species".

In terms of fish landed, the most important fishing grounds in Greece today are the Thermaic gulf, the gulf of Chalcidice, the Strymonian gulf, the gulf of Kavala, the gulf of Lamia, and the gulf of north and south Euboea. The Argolid and Saronic gulfs, the seas around the Cyclades and the islands of Lesbos, Chios, Samos, and Icaria, and the seas of Crete also produce significant catches.

Florina

City in western Macedonia

According to the 14th-century memoirs of John Kantakouzenos, while Byzantium was facing a Serbian invasion in Macedonia in 1334, a notable from Constantinople, Sphrantzes Palaiologos, was appointed to the command of a province consisting of four small towns in western Macedonia, Chlerenon, Soskos, Staridola, and Debre. The first-mentioned among them, Chlerenon, can be safely identified with Florina, being the original Slavic name of the town, which is still known as Lerin in Slavonic languages. Florina is the later, Ottoman, name of the town which was also adopted by the Greeks.

The mention of Florina in the text of Kantakouzenos is the earliest record of the town which had remained in obscurity until then. The town's insignificance is also reflected by the absence of any high ecclesiastical authority there. Florina remained under the jurisdiction of the bishop of Prespa until the late 19th century when it was transferred to the diocese of Moglena. However, efforts were made by the Bulgarian exarchate to establish a metropolitan see of its own in Florina in the late 19th century.

The town is described for the first time in an Ottoman fiscal register of 1481. According to the data it provides, Florina had a population of approximately 1201 people (981 Christian, 220 Muslim). The Christian element of Florina's population was of a mainly Slavic ethnic character, as suggested by the personal names recorded. The same register points to an economy based on agriculture, as most of the town's fiscal revenue was of an agrarian provenance. In later centuries the town retained the agrarian basis of its economy, with commerce and handicrafts catering for local demands. Yet, the proximity of Florina to the principal land route which followed the course of the Roman Via Egnatia facilitated its contact with adjacent and more distant regions. Florina had grown bigger by the second half of the 17th century when it is described by Evliya Çelebi as having 1500 houses (which corresponds to a population of about 7500 people), 14 mosques, three religious colleges (madrasas), and one dervish convent (*teke*).

The Christian population of Florina and the surrounding area was primarily Slavic, though the Vlachs had a considerable presence, and other ethnic groups, such as Greeks and Armenians, were no doubt represented during the Middle Ages and the centuries of Ottoman rule. The people of Florina were receptive to Greek cultural influences, first from the Greek-dominated Orthodox Church, then through the establishment of Greek schools during the 19th century. The intensification of Greek cultural influence coincided with the age of nation-building ideas. As a result, the adoption of Greek cultural features, including the language, first bilingually then exclusively, was accompanied by the building of a Greek national identity among people of different ethnic backgrounds, including a percentage of the Slavs, in the district of Florina. Bulgarian reaction in the late 19th century led to strong rivalry in the areas of religion and education as the Bulgarians established their own institutions in order to counteract Greek progress in shaping local national sentiment. This Graeco-Bulgarian confrontation culminated in fighting which was particularly intense in the district of Florina between 1904 and 1908.

After Florina was incorporated into Greece in 1912, the Hellenization of the local Slavs progressed rapidly as there was no alternative for educational and ecclesiastical purposes, while the arrival of Greek settlers including refugees from Turkey enforced the already existing Greek or Hellenized element. Nevertheless, a considerable proportion of the Slavic

population strongly resisted the processes of assimilation and made the district of Florina one of the very few regions in Greek Macedonia where the presence of a minority created serious problems (31 per cent of the population in the district of Florina are recorded as Slavic speakers in the census of 1928). The Slavic communities of the district of Florina finally disappeared after the Greek Civil War (1946–49), as most of them sided with the leftist Democratic Army of Greece and had to flee the country facing defeat. The rest were completely assimilated to the virtual extinction of Slavic ethnicity in this region of Macedonia where it had been particularly strong. The recent history of Florina demonstrates the effectiveness and success of Greek policies and processes of assimilation.

KONSTANTINOS P. MOUSTAKAS

Summary

The city of Florina in western Macedonia is first recorded in 1334, and by 1481 it had a population of about 1200. Proximity to the Via Egnatia encouraged commercial expansion in subsequent centuries. Its Christian population was largely Slav and by the late 19th century there was serious rivalry between Greeks and Bulgarians for cultural influence. Slavs remained a significant minority until after the Civil War of 1946–49.

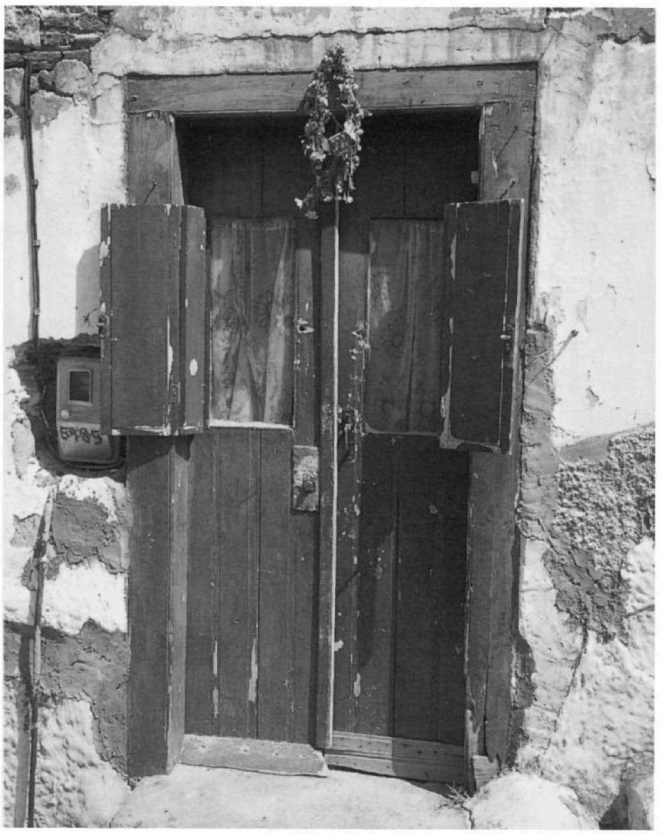
Folklore

Laographia is the term coined in 1884 by Nikolaos Politis, the noted Greek folklorist, to denote the systematic and scientific study of folk traditions, beliefs, customs, and oral literature, as he noted in his definition of the term published in the journal *Laographia*. Politis arrived at the term after thorough and careful consideration of the terms already available in the European academic vocabulary. He was interested in creating a term that would encapsulate the breadth of the English word *folklore* along with the thoroughness of the German term *Volkskunde*. To this end he engaged in extensive correspondence with leading European folklorists, primarily Bernard Schmidt. Politis had followed the European debates surrounding the establishment of folklore as a discipline, the appropriate terminology, and its contents. The English term "folklore" appeared in 1846 in the journal *Atheneum*, coined by the folklorist William Thoms who, writing under the pseudonym Ambrose Merton, proposed that a "good Saxon compound, Folklore" be used to replace the terms "popular antiquities" and "popular literature". Thoms proposed that the new term encompassed both the *study* (the discipline) and the *content* (the lore of the folk) of folklore, which he conceived of and defined enumeratively and specifically as a people's manners, customs, observances, superstitions, ballads, proverbs, and so on. Thoms's work, like Politis's, lay resolutely within the romantic and nationalist intellectual context that interfaced with the archaeological and philological projects of 19th-century epistemologies, which were supported by and themselves supported the struggle for national and ethnic definitions and legitimations that appeared with the dissolution of the Ottoman empire and the attempts at unification by European states (especially Germany and Italy). These nationalist movements, which sought to establish the legitimacy of new sovereign states based on claims of historical continuity with the past, also concerned themselves with proving the continuity of the people's *spirit*. To this end exhaustive research was carried out in Germany, initially, in 1812, by the Grimm brothers (the famous fairy-tale tellers), in Italy by Giuseppe Pitré, and in France, Spain, and Greece by Claude Fauriel, among others. In every case, the study of folklore was meant to show, on a basis of scientific truth (as the term was understood at the time), the validity of the claims made by various ethnic groups as to their historical and unbroken presence at a specific place, which thus acquired ancestral status. This ancestral status became the cornerstone on which the emergence of new national states came to be established, often (as was the case in both Greece and Italy) through war and revolution. The continued intimate relationship between folklore (as a discipline) and national discourses can be found in a "cursory definition" of folklore given by the Greek folklorist Dimitrios Loukatos in 1978, as "the discipline that observes and interprets the spiritual, psychic, and artistic expressions of the life of the people, the ones that constitute the civilisation of the people and the nation" (p. 21). As to any possible claims of folklore to "objective research", Alki Kyriakidou-Nestoros (the late professor of Folklore at the University of Thessalonica) noted that

> if we cannot innocently claim, any longer, for any of the social or even the positivist sciences, "objectivity" of knowledge and scientific lack of bias, I am afraid that we have to admit that folklore, even more so, is a discipline inherently biased ... because the notion of the "people" is particularly fluid and one that is easily susceptible to ideological manipulations and misuse. (p. 10)

Loukatos classified the aims of folklore as follows: scientific, national, humanitarian, and internationalist. As *scientific* aims he identified the historical and cultural information provided about the past and current life of that segment of the population that generates "folk" culture. "We have the duty to know about our past just as a family has the duty to know about its ancestors", he notes. The second scientific aim is the correct contextualization of Greek cultural development alongside the development of neighbouring peoples. The last scientific aim is the contribution of folklore to neighbouring disciplines. As *national* aims Loukatos classifies national self-knowledge which will lead to national self-discipline and self-inspiration. Self-discipline, he suggests, would combat many of the national shortcomings, while self-inspiration would contribute to the continued production of a Greek tradition. Under *humanitarian* aims he mentions the possibility of in-depth knowledge of the human psyche, which in turn would



Folklore: a garland of wild flowers gathered on 1 May and nailed to a front door in Nauplia to welcome the arrival of spring. The discipline of folklore in Greece was initiated by Nikolaos Politis to describe and account for such customs as this.

lead to the deeper love and appreciation of the psyche of the "simple people", something which, in its own turn, could aid the state in its designing and implementing a social welfare system that would be based on folk models of understanding and actions. Finally, through comparative folklore one could prove the internationalist nature of humanity and of the commonality of the human folk experience and goals.

Despite the fact that a well-articulated theory of the discipline of folklore has been in existence since the mid-19th century, its study has been practised by both trained and amateur folklorists in close collaboration with each other. This is especially the case in Greece, where a long tradition of local historians has greatly facilitated the development of a parallel study of local folklore. As Dimitris Loukatos noted in 1978, the contribution of these local, amateur folklorists, who assume the cost of research and publication and make their findings available to trained folklorists for a more complete and methodical classification and taxonomy of the material, has been invaluable. With the firm establishment of folklore as part of the university curriculum and the parallel establishment of university chairs for the study of folklore, research has expanded from the confines of rural, non-literate traditions to include the study of urban and professional material (such as the practices of taxi drivers, urban housewives, hairdressers, truck drivers, schoolchildren, football, card-playing clubs, etc.).

Food and Drink

The food and drink of Greece show a surprising degree of continuity from classical times, and even before, down to the present day.

Prehistoric evidence comes from archaeology and also from the Greek language. The Greek names for many plant foods, and for nearly all fish, cannot be paralleled in other Indo-European languages, suggesting that many of the foodstuffs of Greece were unfamiliar to the speakers of prehistoric Greek before their arrival in the Aegean region. But for cereals (emmer, barley, perhaps millet) and for some important food animals (oxen, swine, sheep, goats, ducks, and geese) the names used in Greek are of Indo-European origin, which indicates that the earliest Greek speakers of the region had brought a knowledge of these species with them.

Archaeologists find evidence of the use of deer and wild goats, of tunny, of shellfish and snails, and of a range of fruits and other plants at sites in Greece from about 10,000 BC and even before. Emmer and einkorn (primitive forms of wheat), barley, oxen, swine, sheep, and goats were farmed in Greece and Crete by 6000 BC. In subsequent millennia grapes, accumulates for a range of seafood. By 2000 BC wine and cheese were certainly familiar. Probably olive oil was already well known: the extent of olive cultivation in prehistoric times has aroused controversy, but quantities of oil are recorded on Linear B tablets. Coriander, dill, cumin, fennel, mustard, and parsley are among the early aromatics of Greece. The world's oldest-known man-made beehive comes from Akrotiri (Thera, modern Santorini), demonstrating that domesticated bees were kept there before the volcanic eruption that destroyed the town, and thus that honey was valued as a food.

For Classical and later Greece, literature becomes the main source. Although in the *Iliad* and *Odyssey* there is no evidence of any elaborate methods of cookery, by the 5th century BC a highly developed cuisine was practised in many Greek cities – partly under overseas influence. Some recipes were said to be Lydian (from the rich and civilized kingdom in western Asia Minor) or Ionian (from the Greek settlements in and near Lydia). Others derived from the prosperous Greek colonies in

Sicily; Sicilian cooks were famous. Growers of fruit and vegetables developed varieties that varied in quality, time of ripening, and soil and water requirements. Athens, rapidly expanding, depended on imports even for staple foods such as wheat.

The staple foods of Classical Greeks, when leading a settled life, were wheat and barley. At home these were baked into loaves in clay ovens or under ashes; travellers and soldiers probably more often boiled them as gruel or porridge. Poor people supplemented this diet with little more than fruit, mushrooms, and vegetables gathered from the wild. Many could afford to add olive oil and flavourings such as cheese, onion, garlic, and salt fish (e.g. anchovy, goby). On the tables of the wealthy the variety of fish and meat dishes and the many savoury and sweet confections were still typically preceded by wheat and barley loaves.

Much cooking was probably done out of doors, and took the form of grilling, roasting, frying or boiling over a fire, or baking in hot ashes; *klibanoi*, baking cloches or clay ovens, were used for bread. Cooks depicted in Athenian comedy of the 4th century BC happily list the methods they preferred. At least one cookery book, by Mithaecus, had been written; others would follow. The humorous gastronomic poem of Archestratus, now known only in fragments, shows that travel and trade were encouraging the appreciation of local produce and regional cuisine.

Comedy cooks sometimes list the range of ingredients they would expect to have at hand. These lists include thyme, oregano, fennel, dill, sage, rue, parsley, fig leaf, coriander leaf, and other herbs; raisins, olives, capers, and sumach; onions, garlic, and leek; cumin and sesame seed; almonds; olive oil, vinegar, grape juice; eggs, pickled fish, salt. Favourite kinds of wine, oil, and luxury foodstuffs criss-crossed the Aegean, but the only commonly used ingredients that had to come from far away were *silphion*, the now extinct aromatic from Cyrene; dates from the Levant; *horaion* and other forms of salted tunny, and *garos* (fermented fish sauce), both of which came from the Black Sea ports, as did much of the wheat that Greece imported.

Greeks commonly ate two meals a day, a lighter *ariston* at the end of the morning and a heavier *deipnon* in the early evening. Among the leisured classes, dinner might lead into a *potos* or *symposion* (drinking party). In Sparta and on Crete the typical meal in Classical times was a communal one, served in a public hall. In Athens and other cities private dinners were often held, at which guests reclined to eat, an eastern fashion. At the beginning of the meal a small table, freshly scrubbed, was placed in front of each diner or of each couch. Food from the serving dishes might be taken directly on to the table, or on to bread, and eaten with the fingers.

An elaborate dinner of the 4th century BC began with the serving of loaves in baskets. A relatively light first course consisted of appetizing relishes, *paropsides*, to eat with the bread. A selection of more generous fish, poultry, and meat dishes formed the main course. Fresh meat was spit-roasted or grilled, and required to be slaughtered and prepared by a professional *mageiros* (butcher-cook) with appropriate religious ritual. Dessert was called *deuterai trapezai* (second tables) because clean tables were brought in at this point. It consisted of cakes and sweetmeats, cheese, nuts, fresh and dried fruit. Between main course and dessert, wine was first served: it was normally mixed with water. Wines of Chios, Lesbos, Thasos, and the coast of Macedonia had lasting popularity. "Water is best", said Pindar, but the drinking of water "unmixed", without the addition of wine, was discouraged by many doctors.

Food was a medium of patronage and dependence. The dependants (*parasitoi*) of powerful Athenians and the courtiers (*kolakes*, "flatterers") of Hellenistic monarchs were fed by their masters, and paid for their food with more or less tangible services. Cities honoured their guests with dinner in the *prytaneion*, a public building containing dining rooms.

The Hellenistic cuisine of the eastern Mediterranean, after Alexander the Great's conquests, took on a new style influenced by Macedonian, Persian, and other cuisines and customs. Trade within the Mediterranean area continued to grow; crop varieties were exchanged and tested in new environments. New fruits (peaches, cherries, lemons) were introduced from the east; spices began to be imported from Persia, India, and beyond. Thus the Hellenistic menu differed from the Classical Athenian menu in many ways. New kinds of bread became popular, some apparently native to Cappadocia and Syria. Oven-roasting of meat was introduced from the East, allowing the development of large and elaborate stuffed meat dishes, which afterwards became typical of Roman cuisine. Macedonians liked to drink wine earlier in the meal and with less admixture of water (this, some said, killed Alexander).

No sudden change occurred when most of the region became part of the Roman empire. In the arts of luxury Rome deferred to Greece. The cookery of Rome came under strong Hellenistic influence – Greek cooks were in heavy demand – and Latin is full of Greek loanwords for food terms. From Roman times (about AD 200) comes the single most important source text for ancient Greek food and dining, the *Deipnosophists* ("professors of dining" or perhaps "professors at dinner") of Athenaeus of Naucratis. A second important text (not yet translated into English) is Galen's dietary survey, *On the Properties of Foods*.

Byzantine cuisine grew out of Greek and Roman influences, but Byzantium did not cease to innovate. Dried meat, a forerunner of the *pastirma* (preserved salted meat) of modern Turkey, became a delicacy. Among favoured game were gazelles and wild asses. The Byzantines appreciated salt roe, *oiotarichon* (literally "egg pickle": hence the modern term *botargo*); they were to taste caviar, *kabiari*, and kippered herrings, *rengai*. Fruits unknown to the Classical menu included the aubergine, *melitzana*, and the orange, *nerantzion*.

New flavours multiplied. It was probably the Byzantines who first tried rosemary as a flavouring for roast lamb, and who first used saffron in cookery: both these aromatics, well known in the ancient world, had not previously been thought of as food ingredients. Nutmeg was sprinkled on the pease pudding that was a fast-day staple. It is among spoon sweets and sweet drinks that the distinctive flavour of Byzantine cookery is best sensed. The increasing availability of sugar, *zachar*, assisted the confectioner's inventiveness: rose sugar, a popular medieval confection, may well have originated here. The flavoured soft drinks (required on fast days) and flavoured wines of Byzantium, distant ancestors of the mastikha, vermouth, absinthe, and pastis of the modern Mediterranean, were fine-tuned to give a healthy diet month by month: they

Food and Drink: woman kneading dough (5th century BC), an activity still performed by many women in rural Greece, Ashmolean Museum, Oxford

called for such ingredients as spikenard, gentian, yellow flag, stone parsley, gum benzoin, ginger grass, chamomile, and violet.

Medieval travellers to Byzantium did not always like the strange flavours they encountered. Fish sauce was still much used and was an acquired taste; so was squill vinegar. Most foreigners and even some Byzantines disapproved of retsina: "undrinkable", said the supercilious Liutprand of Cremona in the 10th century. But even strangers were seduced by the confectionery, the candied fruits, and the sweet wines.

The food of the poor of Constantinople was no doubt limited, though cheese, olives, and onions made up for a scarcity of meat. *Timarion*, a satirical poem of the 12th century, offers a salt pork and cabbage stew as a typical poor man's meal, eaten from the bowl with the fingers just as in contemporary western Europe. Inns and wine-shops generally provided only basic fare: though it is a 6th-century Byzantine source, the *Life* of St Theodore of Sykeon, that contains the earliest reference known anywhere in the world to an inn that attracted customers by the quality of its food.

Descriptions of the food of early Ottoman Greece display continuity with that of Byzantium, but by the 18th and early 19th centuries travellers were noting the relative poverty of Greece. Constantinople, still a Greek city but also the capital of a great Muslim empire, continued to attract the long-distance trade that it had always done. Its spice market was one of the wonders of the world, and the Seraglio consumed luxury foods from all over the eastern Mediterranean.

Modern Greek food and wine are the products of a long tradition. The importance placed on fine seafood recalls the preoccupations of Classical Athens. Cheese is still often stored in brine, as it was in ancient and medieval times. The aroma of Chian mastic, the world's first chewing gum, still used by many to freshen the breath, is as distinctive as that of the honey-soaked patisserie the ancestry of which can be traced in recipes preserved by Athenaeus. The EU hierarchies of *appellation contrôlée*, favouring local distinctiveness, are appropriate to the wines of modern Greece, grown in terrains that have not been ravaged by phylloxera, where local grape varieties tend to do better than the fashionable ones.

Foreigners

Homer's Trojans are not markedly different in character from his Greeks. As knowledge of foreign peoples penetrated the Greek world, however, increasingly the Greeks came to define their own character in opposition to that of foreign peoples. Pindar spoke of how the man without a wagon was a nomad among the (nomadic) Scythians: the Greeks, by comparison with the archetypally rootless Scythians, saw themselves by definition as city dwellers. The lyric poets of the Archaic age already identified luxurious living and tyrannical government as characteristic of Asia. The contrast between Greeks and "barbarians" and the accompanying sense of a common Greek identity were given a new emphasis in the aftermath of the Persian Wars between the cities of the Greek mainland and the Persian kings Darius and Xerxes (490–479 BC). Herodotus famously encapsulated this common identity by making the Athenians deny a charge of betrayal by pointing to their "sharing the same blood and the same language, with common shrines to the gods and sacrifices, and the same way of life".

The common blood of the Greeks is, among these criteria of Greek identity, perhaps the one given least emphasis in our sources. However, the differences in way of life between Greeks and foreigners are often seen as dictated by innate characteristics. The Greek version of the origins of the monarchy of the Medes, for example, describes how, living in villages with no form of common organization, the Medes gradually turned for the settlement of disputes to the authority of a single man, their future king Deioces, who then imposed his own terms and conditions. The Medes, the story implies, naturally gravitate to a strong leader; the peoples of Asia – by contrast to the freedom-loving Greeks – are natural slaves.

Greek polytheistic religion was, at least overtly, a universal religion. The Greeks equated their own gods with those of foreign peoples, saying, for example, that Dionysus was the Greek name for Osiris or that the Ethiopians worshipped Zeus and Dionysus "alone of the gods". There was no duty of evangelizing in ancient Greek religion. The Greeks could even espouse an ideal that to mock the religion of another people was "madness". However, there were other more subtle ways of distancing the religion of foreigners. Toleration of foreign gods rarely – and only with great caution – led to the institution of those gods' cults. (Though there were "Panhellenic" sanctuary sites such as Delphi and Olympia, different Greek cities likewise had their own distinct cults of common Greek gods.) Some foreign gods proved untranslatable: the grounds are difficult to discover, but probably include the barbaric nature of their rites. Ironically also the intolerance of other peoples was itself the subject of disapproval. The Persians were (in some instances unfairly) charged with gross acts of sacrilege; a number of stories from the Persian Wars relate, with apparent relish, the come-uppances of the perpetrators of such crimes. The Greek destruction of foreign temples was, by contrast, accidental. The practice of *proskynesis* – probably the blowing of a kiss while leaning forward – offered by the Persians to their kings was inaccurately but persistently believed by the Greeks to represent a form of worship. While the Greeks often saw foreign lands, especially Egypt, as the privileged source of religious wisdom and the land from which (in the distant past) their own knowledge of the gods largely

derived, it is noticeable that by their own time they had overtaken the Egyptians in the number of gods in their pantheon.

It was the incomprehensible babble of foreign languages that led to the Greeks terming foreigners *barbaroi* or barbarians. Greeks travelled widely for trade; Greeks served as mercenaries in Egypt in the Archaic period and as administrators and builders in the heart of the Persian empire at Persepolis. But though there must have been Greeks who were fluent in foreign languages, stereotyped caricatures of foreign languages continued; there is also little sign that the ability to speak a foreign language was given any status in the Classical period. The Athenian commander in the Persian Wars, Themistocles, was said to have learnt the Persian language within a year of exile in the Persian court, but there is little suggestion that this was a cause of admiration; rather it seems to have been adduced as another example of his extraordinary cunning. The story, recorded by Plutarch, that a Persian interpreter was killed for daring to express barbarian commands in Greek, is one of a number of anecdotes suggestive of a Greek chauvinism concerning their language. Similar chauvinism attached itself, however, to individual Greek "dialects" – the distinction of language and dialect is essentially a modern one – as to Greek as a whole.

In general also, a sense of national identity by contradistinction to foreign peoples was far less dominant in the ancient world than in the age of the modern nation state. Self-definition could take place as much by opposition to other Greeks, in terms of belonging to a city state (or polis) or to family and kinship groups, as in opposition to "barbarians". Nineteenth-century historians envisaged Greek history as a failed process of national unification. But though Panhellenism proved a convenient slogan for those resisting Persian conquest or for Alexander the Great in his expedition into Asia, any such sense of common purpose was fragile.

The modern Greek identity which emerged from under Ottoman rule was to a large extent dependent upon an imagined continuity between ancient and modern Greece. As Grigorios Paliouritis put it, the Greeks were awaking from a deep lethargy of ignorance of their own past. The resurgence of Greek nationalism in the early 19th century saw the revival of ancient names in preference to Orthodox Christian names. Many of the most prominent public buildings of the newly independent state were built in an ostentatiously Neoclassical style (associated particularly with the Danish architect Theophilus Hansen). Arguably the greatest contribution to this revival of a sense of Greek identity was made by the Austrian scholar J.P. Fallmerayer, who in the 1830s challenged the assumption that the Greeks were the lineal descendants of the ancients. This provoked an enormous reaction. Folklorists such as Nikolaos Politis or Dora Stratou were determined to prove the affinity between modern songs, folk-tales, or dance and ancient practices and rituals. The rawness of feelings on such questions, and the way in which ancient evidence is adduced, are well illustrated by the recent dispute aroused by the Former Yugoslav Republic of Macedonia, and in the common Greek claim that Macedonia has been Greek for 2500 years.

The main battlegrounds in the definition of modern Greek identity are certainly familiar. Already in the first decade of the 19th century there was dispute over the proper form of the Greek language: the spoken or "demotic" Greek, or katharevousa (literally "purifying"), a form of the language designed to enhance the similarities with ancient Greek. A middle course proposed by the intellectual Adamantios Korais was to purify demotic of foreign traces. Korais regularly compared Turks to wild beasts. The religious definition of the independent Greek state was also problematic. The term Hellenes initially denoted non-Christians. Many of the Orthodox citizens of the new state, even the inhabitants of Attica, Hydra, and Poros, spoke *arvanitika* (Albanian) rather than Greek; others in the Macedonian north spoke Bulgarian, although the later schism between the Orthodox and Bulgarian churches ensured that religious and ethnic distinctions ran in parallel. At the same time, the new identity of the Greek state tended to highlight the ancient past at the expense of the intervening Christian period. Before independence, Korais expressed his contempt for the religious obscurantism of the Byzantine past. It was only gradually, with the publication for example of a new study of Greek history by Paparrigopoulos, that this period of national history was reintegrated.

There were other difficulties in defining who was Greek and who foreign. There was considerable tension between the inhabitants of the Greek state (or autochthons) and the heterochthons, those who lived abroad, generally better educated and so given a greater share in the offices of the new state. The arrival of approximately one million new Greek citizens, many of whom could not speak Greek, at the time of the transfer of populations between Greece and Turkey in 1923 resulted in similar problems. The idea that a Greek can live (in the words of John Kolettis in 1844) "in any land associated with Greek history or the Greek race" is still sustained by the common practice of living in foreign lands, or *xeniteia*.

Forestry

"Forestry" is a term not really applicable to pre-modern Greece. Modern forestry is a specialized art, concerned with growing trees merely as a timber crop. Usually it is done on the basis that trees begin by someone planting them and die when they are cut down. In earlier traditions of woodmanship, in contrast, trees are wild creatures, arising spontaneously, and many species survive being felled, and sprout from the stump. Modern forestry has been practised in Greece for over a hundred years, but has not come to dominate the landscape nor to supplant earlier, more complex relations between people and trees.

Trees grow in most parts of Greece, but in the drier eastern half of the country they are getting near the limit of their range and grow slowly, especially when close together. By modern standards they often make poor-quality timber: typical Mediterranean oaks are short, hard, crooked, and difficult to work.

In Classical Greece woodland was of rather limited extent and was to be found mainly in the mountains. Then, as now, the abundant trees were evergreen and deciduous oaks, juniper, various species of pine, fir at high altitudes, and (in Crete) cypress and plane. Trees had many uses: besides timber, they provided fuel, stakes for vineyards, leaves to feed animals, acorns, resin, stocks of pear and olive on to which to graft fruit-bearing varieties, oak bark for tanning leather, osiers for basket-making, fruit, drugs, etc. Fodder could be supplied by trees that, because of constant browsing, never grew larger than shrubs, as happens with the common Greek prickly-oak and many others. Firewood and some timber came also from olives and other cultivated trees.

Most trees in Greece other than pines and firs can be coppiced: when cut down (or burnt), they sprout from the base and yield further crops of produce. Regrowth is delayed and hindered by browsing animals. In modern Greece many trees are pollarded (cut at 3 to 4 m above ground) to protect the young shoots from browsing animals.

Ancient Greeks apparently managed their woods, though not by modern forestry methods. On Chios leases written on tables of stone mention coppice-woods attached to farms, which were expected to produce so much weight of wood each year for ever, either for consumption on the farm or by way of rent. The quantities, a ton or two per year, were quite small. One clause has been interpreted as meaning that the farmer was forbidden to let livestock browse on growing trees, but the text is damaged and the sense unclear at this point. Some big woods had names. The wood Skotitas in the Peloponnese, described by Pausanias, which also had its own god, is still extant. Wood in various forms was regularly imported to islands like Delos that were without woodland.

Athens, giant of Greek cities, was relatively well supplied with woodland, with pine and evergreen oak on Mounts Parnes and Cithaeron and in the Isthmus. Some of it was private property: a list of the lands of condemned criminals, graven in stone in 414 BC, includes an oakery and probably a pinery. Athens was apparently self-sufficient in wood and charcoal, supplied by professional woodcutters. Demosthenes, for example, mentions a farm where six donkeys were working all the time carrying wood to market. Woodland was probably less extensive and certainly less well grown than it is today.

Attic vegetation fuelled production from the silver mines at Laurium, whose output paid for imports of corn and timber. At a rough estimate, Laurium could have kept going indefinitely on the growth and regrowth of maquis on at most 30,000 ha of land. The Athenians were using perhaps one seventh of their land area as a fuel supply for what was by far their biggest industry.

Timber for shipbuilding or big construction came from far away. According to Theophrastus, the sources were Macedonia (the best quality), the Black Sea, Thessaly, Arcadia, Euboea, and Mount Parnassus (from which came the worst). Other documents and inscriptions record minor supplies from all over the Aegean and even Sicily. Athenian foreign policy had to maintain access to the timber of Macedonia: if the Athenians failed in this they had to do without a fleet. The quantities were not great, for a trireme was a huge, lightly-built racing rowing-boat; but specially long timbers were needed for keels and masts.

France

Greeks have lived in France since at least 600 BC. Finds of pottery from Marseilles and Hyères indicate that there were trading links as early as 700 BC, but the first colony, at Massilia

(Marseilles) was not founded until around 600 BC. The attraction of the area was the Rhône river which provided a trade route across France to the English Channel whence tin from Britain could be imported. This incidentally contributed to the development of the Celtic cultures of Hallstatt and La Tène, many of whose hillforts demonstrate Greek influence in their art, architecture, and fortifications. The Greeks were also responsible for introducing cultivation of the vine and olive to France. The Phocaean colony at Massilia prospered during the 6th century BC and established a string of settlements along the coast from Nicaea (Nice) to Emporion (Ampurias) in northern Spain. It also maintained close links with Greece and set up a treasury at Delphi. During the 5th century BC there was a shift in the balance of power in central Europe and the Greek trade route across France was broken. But the colony at Massilia survived and retained its reputation as a centre of Greek culture and learning well into the Roman period.

After the fall of the western Roman empire links between Byzantium and France were broken, but the Byzantines came to see the Franks as potential allies against the Arian Goths and later the Lombards in Italy. The coronation of Charlemagne, however, as "emperor of the Romans" in AD 800 was a severe blow to Byzantine prestige and brought the two empires into political and ideological competition with each other. Nevertheless, cultural and religious links with Byzantium persisted, particularly in Provence, and the emperor Manuel I Komnenos (1143–80) married his son Alexios II to Agnès of France in an attempt to forge an alliance against the Holy Roman emperor Frederick I Barbarossa. The French played a large part in the crusades and it was a Frenchman, Baldwin of Flanders, who became the first Latin emperor in 1204. After the Byzantine restoration in 1261 the emperors frequently appealed to France for support against the Ottoman threat but little help was forthcoming.

In later Renaissance and afterward, Greek communities were also established in France, more distant and with fewer political and commercial connections with Constantinople. In the 16th century, the nucleus of a Greek colony seems to have existed in Lyons, at which time silk-workers were settled, apparently to establish a silk industry in competition with the Italians. Greeks also appeared relatively early in the French capital, Paris. With the beginnings of interest in Greek studies in France in the later 15th and 16th centuries, a number of Greek savants, especially Cretans were to be found there. They included Janus Lascaris, who had firmly established Greek studies in Paris and became the French ambassador to Venice; George Hermonymus, who was a capable copyist of texts despite Erasmus's and Budé's denigration of his abilities; further the expert calligrapher Angelos Vergikios, who was official scribe to the French King and was awarded the post of royal librarian. Furthermore, some modern scholars believe that the original letters cut for the royal Greek press in France by Claude Garamond and by Henry Stephanus were modelled on Vergikios's handwriting. His son Nicholas wrote competent French poetry and mingled with the famous literary group called the Pléiade. Another Greek who appeared in Paris was Antonios Eparchos from Corfu, who presented a number of Greek manuscripts to Francis I, which were to constitute the nucleus for the royal library at Fontainebleau and later the famous Greek collections in the Bibliothèque Nationale, which were also enriched during the reign of Louis XIV by the efforts of the writer and librarian Athanasius the Orator (1571–1663).

During the Middle Ages and the Renaissance, the study of Hellenism in France was the pursued by scholars who were interested in all aspects of Greek civilisation and had contributed generally both to the advancement of scholarship and the spread of Classical ideas. This aim was achieved in three important periods of France's subsequent intellectual history: humanism in the 16th century, classicism in the 17th and 18th centuries, when intellectuals discussed whether ancient or modern writers were more important, the "Querelle des Anciens et des Modernes", in which the ancient world provided an alternative to the present. Meanwhile the search for Greek manuscripts persisted at the French court of Louis XIV and his ministers Colbert and Mazarin organized missions to the Aegean to collect rare Greek manuscripts from monastic libraries.

Up to the 18th-century education in France meant a Classical education, but with the emphasis on Latin rather than Greek. Classical authors were studied and taught with didactic and ethical preoccupations in mind. For moral examplars and heroic prototypes, the mind of an educated 18th-century Frenchman turned naturally to Greece and Rome; their history and literature were regarded as a vast treasurehouse of moral precepts and exemplary attitudes.

Hellenism as a concept was first introduced in French by Montaigne in 1580 in his *Essays*. Hellenists were, at that time, absorbed by the scolastic study of texts and their philological problems. Books such as the *Antiquité Expliquée* by Montfaucon (1719) the *Recueil d'Antiquités* (1750–67) by the Comte de Caylus, along with works of Winckelmann opened up a broader vision of Hellenism as a human reality. At the same time, Byzantium was also studied by French scholars: in 1648 P. Labbe's book *De Byzantinae Historiae Scriptoribus ad Omne per Orbem Eruditos Protreptikon* appeared, and a century later Charles Le Beau published an unfinished work in 21 volumes, the *Histoire du Bas-Empire* (Paris, 1757–1786). Difficulties of interpretation were resolved and there was increased specialization in Classical learning among professional scholars; minds shaped by the reading of Greek literature, were ready to welcome the new ideas.

The Enlightenment, which was a turning point in the apprehension of antiquity did not consciously cling to the past and could not ignore the differences produced by time. Among the Greek states it was not Athens with its pure form of democracy that was venerated by the French, but rather Sparta. Both Montesquieu and Rousseau judged Sparta to be a model of freedom and order, its people distinguished by public virtue, simple lifestyle, patriotism, vigour. Jean Schweighaeuser, D'Ansse de Villoison, and A.J. Letronne gave an impulse to the editing of Greek texts and tried to present some interpretations on the problems of the Greek world. Pierre-Charles Lévesque dedicated his whole life to Thucydides. New disciplines such as archeology, ethnology and cultural anthopology began to examine the cultural evolution of Greek antiquity. An idea that prevailed in France and which was expressed by Condorcet in his *Esquisse d'un tableau historique des progrès de l'esprit humain* (Paris, 1795) was that the history of ancient Greece is a microcosm of the history of human race. Jean-Pierre de

Bougainville wrote in 1764: "Il est certain que l'histoire de la Grèce, se peuplant et se poliçant par dégrés, est moins le spectacle des destinées d'une nation qu'une perspective où le genre humain se peint en raccourci dans différents états." ["It is certain that the history of Greece, which was progressively inhabited and civilized, is less the spectacle of a single nation's destiny than a perspective in which the human race is seen in a succession of different states."] Nevertheless, the works of such Hellenists as Chardon de La Rochette, Millin and Choiseul-Gouffier was not only important for understanding ancient Greece but more for modern Greece. Nor were Greece and its literature absent from the work of Madame de Staël, Ginguené, Sismondi and Fauriel.

Up to the end of the ancien régime modern Greece as a province of the vast Ottoman Empire, was considered in France as a phenomenon of degeneracy. For the French people, Ottoman rule was a paradigm of lawless tyranny, of a hierarchy of oppression in which each man lorded it over those beneath him. C.-F. Volney, for instance, who was a ideological believer in the primacy of reason, and equally opposed to the cult of feeling and absolutism, in his *Considérations sur la guerre actuelle des Turcs* (London, 1781), considered the question of Greece's survival to be identified tather with the restoration of antiquity; a similar aspiration underlay another work of the French Enlightenment, the *Voyage du jeune Anacharsis en Grèce*, (Paris, 1788) written by the abbé Barthélemy, who was followed by many French liberal writers who supported the emancipation of Greece such as the great philhellene René de Chateaubriand. However, the fervour of the Revolutionary France was also characterized by an awareness of a return to the civic virtues of Classical antiquity – in oratory, in painting and sculpture, in the decorative and applied arts, in design. Some years later the philhellenic movement took place, which had been nourished and strengthened by Romanticism and in which humanism and the ideas of the Enlightenment played still a major role. What is remarkable is that the French philhellenes who went to liberate Greece and took part in the war for Independence, such as Persat, Fabvier and Jourdain, were chiefly Bonapartists who wished by their success in Greece to show that their party was no mere relic of the past but a living force.

On the other hand, Napoleon's designs on the eastern Mediterranean were well received in Greece and it was a sign that French revolutionary fever had reached Greece when, in June 1797 a French expeditionary force took over the Ionian Islands. The principles of French Revolution were preached. It was an important moment for Greek political thought which, in the wake of Rigas Velestinlis, was progressing towards a broader conception of liberty and human rights. On the other hand, in Constantinople a strong opposition movement was represented by the traditionalists who fought French republican ideas and saw in the French Revolution the coming of the Antichrist. A typical example of this attitude is to be found in a well-known passage of a satire against Francophilia the *Moral Versification* of Alexandros Kalphoglou of Constantinople; the author characterizes the enlightened Frenchman as "an impious libertine"and says of the Greek intellectuals of that time that "they boast of being the pupils of Mirabeau, Rousseau, and Voltaire, even if they do not understand them, and have never read them".

By the second half of the 18th century the Greeks had made considerable economic and intellectual progress. A Greek colony was founded in the cosmopolitan port of Marseilles by merchants who came mainly from Smyrna and from the islands of Chios and Hydra. This Greek merchant colony of Marseilles provided an important channel for the transmission of republican political ideas to the Greeks. In this connection, wealthy families of merchants as the Zizinia, the Rodocanachi, the Prassacachi, the Agelasto, the Vlasto, the Ralli, the Schilizzi, and many others showed great interest in the achievements of the Greek War of Independence and together with the French formed philhellenic committees. The most important of these, was the *Association Philanthropique* which was first formed in Paris by personalities from political and intellectual life.

A few years before the outbreak of the War of Independence, the Greek community in Paris became of great importance for Greek diaspora and Greek intellectual life: Adamantios Korais, Constantine Nikolopoulos, Panayotis Kodrikas were residents there and contributed to the intellectual emancipation of modern Hellenism. Greek students were attending French universities as well as the newly founded Ecole Polytechnique; they studied medicine, mathematics, physics, and chemistry, liberal arts (Dorothéos Proïos, Benjamin of Lesbos, Néophytos Vamvas, Theophilos Caïris), and they carried back French scientific thought and literature to Greek schools. Greek books were printed by Firmin Didot and Greek magazines were published such as *Athena*, *Melissa*, *Mousseion*, and *Le Polyglotte*; in 1828 the *Société Hellénique* was founded.

After the emergence of the Greek state, French education and language played an important role as vehicles of cultural change. The translation of literary works and the adoption of cultural styles constitute a good index of this process of reception. Leading Greek figures attended French universities during the 19th and the 20th centuries. The Greek presence also made its mark in the cultural and artistic life of Paris; in the later 19th century Jean Moréas became a leading figure in French poetry, and Yannis Psycharis also played a part in French and Greek literary life; these cases can easily be multiplied for the twentieth century, for example with the painters Dimitris Galanis, Giorgos Gounaropoulos, Marios Prassinos, Thanassis Tsingos who lived and worked in Paris.

Following the expulsion of the Greek population from Asia Minor in 1922 many Greeks settled in France and strengthened the Greek communities. During the period of the military junta (1967–974) 20,000 Greeks lived in France, many of them active political exiles, sharing the ideas of the Greek progressives forces. Today Greek communities number 5000, and cultural relations between Greece and France include not only state-sponsored exchanges and festivals of the arts, but unrestricted communication and dialogue.

Freedom

W.G. De Burgh reiterates a cliché of Classical scholarship when he calls the ancient Greeks "the people who created science, who first grasped the meaning and worth of freedom in thought and action". Denys Haynes echoes the claim that "the relationship between freedom and necessity is the fundamental theme of Greek art", and adds that the idea of human freedom is "the highest achievement of Greek thought, distinguishing it from that of all the other peoples of the ancient world and laying the foundation of our modern Western civilization". Gilbert Murray goes further still, asserting that "of all peoples known to us in history, the Greeks were far and away the freest thinkers", and that (despite China and India) "there is no philosophy except in Greece or derived from Greece." In science, art, philosophy, and of course politics ancient Greece (especially Athens) has long been celebrated as the birthplace of freedom.

Recent critics have cited factors that complicate or contradict this traditional picture. The cultural authority of the West, of which Greece is supposed to be the foundation, has itself been called into question. Greek anti-barbarian sentiment is reconceptualized as the prejudice of "orientalism". Athenian democracy is scrutinized for its exclusions and oppressions (for example, women and slaves). Greek claims to priority in science, and even science's claims to intellectual pre-eminence, are challenged, in the name of multicultural fairness. In response, defenders of the traditional view insist that the challenges themselves rely on unacknowledged appeal to aspects of the Greek intellectual legacy. Such disputes are made more difficult by the fact that freedom is a complex and contestable concept to begin with. In a brief discussion it must suffice to sort freedom into three rough categories: practical, political, and philosophical. Greek thought and practice have made significant contributions to understanding all three.

Freedom in the practical sense is the power to live as one chooses. This notion of freedom is tied to the idea of self-rule (autonomy). Individuals are *un*free in so far as their lives are determined not by themselves (that is, by their values, desires, and beliefs) but by what is other than themselves. Since human beings do not appear to be immortal, let alone omnipotent, and since one person's power must often limit the power of another, this sort of freedom can only be possessed to a degree. One may hope to see such power expanded to more people, to more kinds of people, to more aspects of human life. The intellectual project of expanding human freedom through expanding human power runs from the ancient Greeks down to 14th-century "humanism" and the 18th-century "Enlightenment", and so on to the present. On the traditional account, Greek rationality was the enabling precondition for the subsequent development of western scientific inquiry; some recent critics, however, view this as naive and ethnocentric. In any event, one human's power is another's vulnerability, so the quest for freedom is not merely an intellectual or technological undertaking, but requires adjustment in social forms. Except in ideal circumstances, practical freedom requires social and political support (though the demands of political freedom can be viewed as themselves impinging on one's practical freedom).

Freedom in the political sense is the power to participate in a suitable way in the processes that determine the political structure in which one lives. Freedom in society requires limits, and therefore the transformation of external constraints into self-rule (*sophrosyne*). By incorporating aspects of social reality into the self, one can see regulations as expressions of the "civilized" self, which is a creation of the polis. In classical practice, this political conception of freedom can be praised for its natural affinity with notions of democracy, equality, privacy, and individual self-expression, or criticized in view of the restrictions on membership in the polis. To modern readers, Plato's attack on democracy and Aristotle's defence of slavery strike sour notes. Whether the cultural achievements of Athens' golden age "required" the material foundation of slavery on which it in fact relied, and whether such a requirement could serve in any measure to "justify" that society's abridgement of freedoms, are uncomfortable questions still often debated. Several scholars (for example, M.I. Finley and

Orlando Patterson) have suggested that the existence of slavery contributed conceptually to the development of the idea of freedom, which grew out of the very exclusions of Athenian democracy.

If the opposite of political freedom is slavery (and other forms of oppressive dependence), the opposite of philosophical freedom is determinism. The notion of fate or destiny (*moira*) colours early Greek religious thought, and connects to familiar philosophical questions about freedom of the will. Later, Stoic sages advise restricting desire to the sphere in which one is able to exert some control. While one may not have the power to live as one chooses, one can still choose to live one's life in conformity with the power that one does have. Freedom in this philosophical sense consists of adjusting expectations to the realities of one's situation; freedom requires acquiescing in necessity. This viewpoint is expounded in Greek by both slave (Epictetus) and emperor (Marcus Aurelius), with enduring influence on western thought. In the koine Greek of the New Testament, St Paul (whom Gilbert Murray called "one of the greatest Greek writers") adapts the paradox that true freedom consists of acquiescence in being bound by (religious) truth. Paul's frequent references to himself as the "servant" (*doulos*) of God and of Jesus, along with his exhortation to servants "to be obedient unto their own masters" (Titus 2: 9) – though these are part of the transvaluation of values that Nietzsche would later complain about – help to define a religious notion of freedom for Christianity, which plays a dominant role during the Byzantine period of Greek history and after. This religious version of the philosophical notion of freedom also has metaphysical concerns about the place of human action in a non-human world (ruled by God), and it raises political questions, particularly in connection with the idea of a Christian polity, whether that of an empire, like Byzantium, or that of a quasi-secular, henotheistic nation, such as modern Greece. (Additional religious and political complexities characterize the long interval of Turkish domination and the struggle for independence and national self-determination.)

The often expressed (but misleading) idea that Greek civilization was "centred on the individual" may serve to unite the three sorts of freedom, for the individual is a participant in the struggle to survive in nature and in society, as well as the subject of that play of power and desire whose rational articulation comprises the substance of philosophical freedom. Some will find the important expression of human freedom in the expansive, pleasure-seeking, Epicurean (even "Dionysian") approach, while others will hold that a realistic sense of human freedom is best discerned by the restrictive, desire-limiting Stoic (and, in terms of Nietzsche's influential dichotomy, "Apollinian") approach. In this sense, the debate about freedom is not likely to reach either an answer or an end, and it may well be that, in the words that E.R. Dodds quotes from T.H. Huxley, "A man's worst difficulties begin when he is able to do as he likes."

Fundamentalism, Orthodox

The term "fundamentalism", coined in the US in the 1920s and referring to conservative Protestants reacting against liberal trends, was later used more broadly to describe a variety of different sociocultural phenomena. Though widely used, the term still retains a clear connection to the religious sphere, to which it was originally applied. Another related term is "integrism", referring to analogous phenomena within the Roman Catholic Church. Generally, the main fundamentalist intentions are the purity and authenticity of the doctrine; the emphasis on the "fundamentals" of a religious system; the improvement of practice and its consequential relationship with theory; and the return to a past, glorious epoch, in which the principles of the ideal society had been realized.

There exist numerous reasons and causes, both endogenous and exogenous, which may give rise to fundamentalist currents as protest movements in various socio-cultural contexts worldwide. Usually, fundamentalists react against modernist trends within their religious bodies and to radical changes in their social environments. The fundamentalist mentality must be

distinguished generally from a full-fledged fundamentalist movement. While we may find aspects of a fundamentalist attitude in earlier periods too, fundamentalism is basically a modern phenomenon. Moreover, fundamentalism should not be equated simply with fanaticism, radicalism, extremism, reactionism, zealotism, traditionalism, conservatism, and other similar phenomena. Though in many cases closely related to them, fundamentalism points to a more inclusive attempt to reinterpret and incorporate such features into a wider protest movement.

Fundamentalist movements can also be observed within the Orthodox world in modern times (e.g. in Russia). This holds for Greece too, though the term "fundamentalism" has not been successfully rendered into Greek so far. In the Greek case, due to the apparent religious homogeneity of the country, the most marked feature of the fundamentalist movements is their distancing from the official Church, either through a schism (e.g. the Old Calendarists) or through the founding of an independent organization (e.g. the religious brotherhoods). In both cases, serious or milder criticism is exerted on the "pseudo-Orthodox" policies of the official Church, which is accused of playing a solely decorative role in Greek society and of allowing serious compromises with regard to its time-honoured traditions. Orthodox fundamentalists want to purify the Church by imposing certain therapeutic measures and by bringing it closer to a past and idealized golden age (e.g. the Patristic period).

Greek Orthodox fundamentalism is a multiform and multidimensional phenomenon. It cannot be reduced to one single group. Nowadays it is mainly represented by various groups of Old Calendarists, who call themselves the "true Orthodox Christians", and affiliated organizations (e.g. the Greek Orthodox Salvation Movement); by the religious brotherhoods (e.g. *Zoe*, *Sotir*); by various other independent organizations, such as the Panhellenic Orthodox Union with its journal *Orthodoxos Typos*; by numerous monks on Mount Athos and in other monastic communities, who are usually subsumed under the loose category of Zealots; and finally by some small political parties and movements, such as Christian Democracy, founded by N. Psaroudakis. Although there is often tension between them, these groups, which are not hermetically separated one from the other, occasionally collaborate on issues of common interest against the policies of the official Church and the state. It is worth mentioning, however, that several priests and sometimes even bishops of the official Church (e.g. metropolitan Avgustinos Kantiotis, who in 1952 founded in Athens the Orthodox Militant Association "Athanasios the Great") are in close relationship with such movements and share some of their principles and ideals.

The sociohistorical background of Greek Orthodox fundamentalism should be principally sought in late 18th-century Greece. On the eve of its independence Greek society under Ottoman rule underwent far-reaching changes under the impact of western ideas (e.g. of the Enlightenment and the French Revolution), which seriously affected its traditional Byzantine Orthodox culture. This process continued after the foundation of the Greek state, when the Church was subjected to state control and its overall condition deteriorated in many respects. Thus the protest movement of the Kollyvades in the 18th century as well as the cases of Kosmas Flamiatos and Apostolos Makrakis in the 19th century, who were in serious tension with the official Church, can be considered as antecedents of contemporary fundamentalist trends.

The main and common characteristics of Greek Orthodox fundamentalists include a sense of exclusivity in possessing the sole true faith; a strong feeling of elitism (as being the elect or a faithful remnant); a spirit of self-righteousness and self-sufficiency that leads them to isolation, separatism, and tension with the official Church and the surrounding secular culture; anti-pluralist trends and a totalitarian mentality; a persistent enemy syndrome and conspiracy mentality, imbued with an apocalyptic spirit, that drive them to suspect dangers for Orthodoxy everywhere, initiated by the "Powers of Darkness" (e.g. Roman Catholicism, Protestantism, Freemasonry, Zionism, the ecumenical movement, the European Union) in the contemporary world system; fanaticism, militancy, and even violence (e.g. against beauty contests and carnivals, against the film *The Last Temptation of Christ* and Nikos Kazantzakis's works, the Rotonda incidents in Thessalonica in 1994–95) in implementing their ideals; a special emphasis on moral issues and promotion of their own puritanical, patriarchal ethics and lifestyles; a social activism in order to transform the Church and the world; hyper-Orthodox trends that finally force them to suspect each other of deviations from Orthodoxy; a total rejection of certain scientific (e.g. the theory of evolution) and technical developments; an opposition to intellectualism, freedom of thought, and academic theology; and a strong correlation between Orthodoxy and nationalism concerning the God-determined future glorification of Greece.

Although Greek Orthodox fundamentalists have not yet been very active in politics, they are still greatly interested in playing a more significant role in this domain. To this end, they are also approached by some politicians who occasionally support quite extreme fundamentalist demands and try to profit from the social influence that fundamentalists are able to exercise on certain social strata. The violent conflicts between fundamentalists of varied provenance and the official Church, supported by the state, in the diocese of Larissa (1989–98) over the election of a new bishop have demonstrated the effective structure, the considerable vigour, and the mobilization power of the fundamentalists. This has provoked a determined reaction from the official Church, which fears the long-term impact of such activities upon the wider Church body and the increased appearance of similar phenomena in the future. To this purpose, the Church has issued official encyclicals condemning fundamentalist views and actions as non-Orthodox and anti-ecclesiastical. It also threatened to consider them as schismatics and heretics (see the encyclical no. 2564 of 25 October 1993 against the Panhellenic Orthodox Union and its journal *Orthodoxos Typos*).

Generally speaking, Orthodox fundamentalism is not the most salient characteristic of Greek society as a whole. Yet it does constitute a specific feature of Greek religious life, is able to exert some pressure on official Church and state policies, and, as recent events have shown, may demand more access to positions of power and influence in the future.

Furniture

The human activities of sitting, eating, lying down, and storing objects required furniture in the homes of ancient Greece. The development of hierarchic sociopolitical structures in the Bronze Age gave added impetus to furniture development, in the multiplicity of forms and decorative embellishments, as seen in the decorative ivory and gold inlays from the Mycenaean period.

Stationary furniture, such as dining couches, and outdoor furniture, such as benches in a theatre, was often sculpted out of bronze and stone. But furniture construction was generally within the province of carpenters, because wood was the typical material, being relatively lightweight, durable, and easy to fashion. Wood varieties mentioned by ancient Greek authors include maple, beech, oak, willow, cedar, cypress, yew, juniper, poplar, fir, lime, olive, elm, and pine. By the 6th century BC Greek carpenters had most of the possible hand tools for working wood – the adze, axe, saw, plane, hammer, chisel, borer, screwdriver, file, rule, level, plummet, and lathe. Joinery techniques depended on wood constructions of dowel and tenons, socket and tongues, butterfly cramps, and complex mitre joins rather than metal hardware. Steamed bent wood is seen in the chair backs of the 6th and 5th centuries BC. Finishing techniques included veneer, painting with geometric decorations, and oil polish.

The earliest references to Greek furniture are from the Mycenaean culture. The original 13 Linear B furniture tablets found in the palace at Pylos in 1939 (now in the National Archaeological Museum, Athens) record elaborate chairs, footstools, and tables made out of stone, crystal, yew, boxwood, or ebony inlaid with ivory decorations depicting cattle, lions, stags, trees, men, shells, and rosettes. Ivory ornaments have been found at several Mycenaean sites that are probably the inlaid remains of such furniture, from which the wood has disintegrated. Additional evidence comes from the miniature, crudely painted terracottas found in graves that portray low, simple beds and three-legged, sling-back chairs. Clay benches were common and found at Pylos, as was a big clay bathtub. A fresco from Pylos shows tall three-legged wooden tables carried by votaries.

Evidence for furniture from the Greek historical period consists largely of literary sources and images on pottery and sculpture, and consequently, our knowledge is limited primarily to Classical Athens. The types of ancient furniture included chairs and stools, benches, beds and dining couches, tables, and chests. Round metal or pottery oil lamps, which held a wick in the spout, provided light and could be placed on the floor, a shelf, or on tall bronze, single-legged stands. Personal possessions remained few, and clothing simple. Most household objects were stored by hanging them on the wall or placing them in chests (*kibotoi* or *larnakes*) or small boxes. Clothing in particular could be folded flat, since it was made of rectangular pieces of cloth, and stacked in large chests with a top lid. Thrones (*thronoi*) and footstools (*thrinyes*) were manufactured with animal legs, which had been popular in Egypt and Mesopotamia; lathe-turned legs, which become common in Greece only after the 7th century BC; rectangular legs; or solid sides extending to the floor. Thrones had a hierarchic meaning in that they elevated and enlarged the stature of the nobility and, of course, deities. The popular, lightweight chair (*klismos*) with curved back and legs was an extraordinarily graceful Greek invention that was used for domestic purposes; it was easy to lounge in while draping one arm over the back. Four-legged (*diphros*) or folding stools (*diphros okladias*) were also used for seating. Tables, usually three-legged (*trapezai*), were lightweight due to dining customs. Food was carried on these low portable tables from kitchen to dining-room and removed afterwards or pushed under the dining couches so that the space could be used for entertainment. The dining couches (*klinai*), on the other hand, were stationary, often the only permanent furniture in the house, and so could be solidly made and heavy, sometimes constructed of bronze. Eating while lying down was practised in the ancient Near East on waist-high couches, mounted by means of a footstool, but the long bow-curved end of the Assyrian couch was not adopted in Greece. Instead, the Greek couch extended two of its legs higher than the seat to support the arm-rest pillows. Dining couches carried specific social connotations, in that well-born men used them for sleeping or dining. They usually shared a couch with another man or a courtesan. Wives, however, dined in separate quarters, upright on chairs.

There is less evidence for furniture from the Byzantine era. Thrones are the predominant furniture shown in mosaics, ivories, and manuscripts, due to the prominence of saints and

kings being portrayed. They were elaborately carved as seen on the ivory Harbaville Triptych in the Louvre of *c.*AD 950 or studded with jewels, as on the throne on the mosaic of the Virgin and Child enthroned in Hagia Sophia, of *c.*850.

Simple one-room houses with a ground floor and upper level were typical throughout the medieval era in Greece. The furnishings were sparse with wooden screens carved with vegetal motifs to hide the sleeping areas, built-in wooden cupboards with carved doors, low round tables, chairs, chests, and stools. Wooden furniture from Skyros and Crete was particularly well known for its high quality. The quality of wood carving remained high as carpenters were continually occupied by carving wooden iconostases and other church furnishings, particularly in western Macedonia and the islands.

By the 18th century a wealthy merchant class arose in Greece who built large homes in western Macedonia, Epirus, the Peloponnese, and the islands. Influenced by western European fashions, elaborate reception rooms were covered with wood panelling of open fretwork, carved flower panels, and complex mouldings, as can be seen in the room of such a house, built in Kozani in the late 17th century, and now on exhibition in the Benaki Museum in Athens. Furnishings in these merchant houses remained simple, with cupboards, armchairs, stools, and low tables.

Greek furniture has continued to follow European furniture styles from Neoclassicism to Modern and finally Postmodern design. Most furniture today comes from Athens and Thessalonica.

G

Galen AD 129–?208/16

Physician and philosopher

Galen, a prolific Greek physician and philosopher born in Asia Minor (Pergamum), became the dominant influence on European medicine from the Roman empire until the Renaissance. The son of a prosperous architect, he was educated in rhetoric and studied philosophy under Platonists, Aristotelians, and Stoics in Pergamum before taking up the study of medicine. The effects of this early training on his thought and style remain amply visible in the more than 170 fully and partly extant treatises attributed to him (a substantial majority of which are of undisputed authenticity). After continuing his studies under distinguished physicians in Smyrna and Alexandria, Galen returned to Pergamum in AD 157, where he apparently became a spectacularly successful physician to wounded gladiators. In AD 162 he went to Rome, returning to Asia Minor in 166, only to be called back by Marcus Aurelius in 169 to serve the Roman imperial court, in whose service he remained thereafter.

Galen attempted to give a comprehensive, detailed account of all aspects of medicine: anatomy, physiology, nosology, aetiology, diagnosis, prognosis, pathology, therapeutics, dietetics, pharmacology, surgery, deontology, ethics, psychology, medical education, medical history, theory of scientific method, and so on. He constantly wove conceptual, doctrinal, epistemological, and methodological links between the different branches of his comprehensive enquiry, thus lending his project the appearance of a systematic, monumental, and scientific whole. Furthermore, he had many impressive prognostic, surgical, and other therapeutic successes (for example, removing a suppurating breastbone and often succeeding where all other practitioners had failed), proving that he was not merely a brilliant theorist but also an accomplished clinician.

Galen's public anatomical demonstrations, at which he dissected and vivisected various animals, appealed to the theatrical sense of a 2nd-century audience attuned to the "display" culture of the Sophists' public declamations. Unlike Herophilus and Erasistratus, he never performed systematic dissections of human cadavers, and his use of comparative anatomy at times led him to attribute non-human features to the human body. His meticulous dissections of monkeys, apes, pigs, goats, etc. (recorded in *On Anatomical Procedures*) nevertheless allowed him to correct numerous observations and theories of his predecessors.

A voracious reader, Galen eagerly displayed his encyclopedic knowledge of the works of his precursors and contemporaries, and, for the most part, he was unsparing in his criticism of them. Even to Plato and Hippocrates, whom he revered more than all others – and whose views, he argued at length, are essentially in agreement (*On the Doctrines of Hippocrates and Plato*) – Galen at times responded with independence and originality. By constantly incorporating the history of medicine and of philosophy in impressive, if often self-serving, critical detail, he positioned his treatises as superseding all others. An invaluable, if unintended, benefit of this Galenic strategy is that he is an invaluable source for the history of medicine between the Hippocratic Corpus and the 2nd century AD, providing numerous quotations from the lost works of Diocles, Herophilus, Erasistratus, Asclepiades, and others. He likewise preserves significant evidence concerning lost philosophical works (e.g. of Posidonius) and many fragments of Greek poetry.

Galen used his keen philosophical ability to lend his work the authority of a sophisticated logic of scientific demonstration. He viewed medicine as a completable axiomatic science. Any gaps, errors, and inaccuracies in scientific medicine arise, he believed, not from the nature of the medical *techne* itself but from human cognitive or linguistic failures or from quantitative imprecision. His mastery of logic – to which he made original contributions – as well as his teleology and his treatment of many psychophysical questions rendered Galenic medicine appealing to numerous philosophers, too, in subsequent centuries.

Anatomical investigations and physiological experiments provide scientific proof of the providentiality of nature, Galen insisted. "Nature does nothing in vain": on this point he agreed with Aristotle, but he defended a stronger version of teleology than perhaps any of his predecessors. In his principal work on physiology (*On the Usefulness of the Parts*), Galen attributes the pervasive purposiveness visible in the body to a divine, craftsman-like "Nature", evoking many echoes of Plato's *Timaeus* (on which he wrote a commentary). Though reserved on issues such as the immortality of the soul, Galen adapted the Platonic version of a tripartite soul to his anatomical discoveries, locating its three parts in the brain, the heart, and the liver, respectively. From the brain, he argued, psychic

pneuma, derived from the vital *pneuma* in the arteries, is distributed through the nerves (making sensory and motor activity possible). All the principal physiological activities – respiration, heart-beat and pulse, ingestion and digestion, sensation, and voluntary motor activity – are interdependent and interactive, brought together in a single, coherent, teleological model. In pathology Galen appropriated the four-humour theory of the Hippocratic treatise *On the Nature of Humans*: the relative proportions of four juices or liquids in the body – phlegm, yellow bile, black bile, and blood – determine health and disease.

The medical authority of Galen's vast corpus was rarely challenged in the millennium after his death. Already in the 3rd century AD he was recognized as surpassing all other physicians. In the 4th century Nemesius, bishop of Emesa, made extensive use of Galen in his *On the Nature of Humans*. Galen's fervent advocacy of teleology made him acceptable to many Christians, and he was admired by a heretical sect, the Adaptionists, who tried to provide a rational, philosophical basis for Christian doctrine, perhaps prompted in part by Galen's criticisms of Christians and Jews. In the mid-4th century Oribasius initiated a long tradition of excerpting and summarizing Galenic texts. Aëtius of Amida and Alexander of Tralles (who was not uncritical of Galen) continued this tradition in the 6th century, as did Paul of Aegina in the 7th. In Alexandria physicians and Neoplatonists alike lectured on Galen throughout later antiquity; the Christian Neoplatonist John Philoponus (AD 490–570s) had high praise for Galen's original contributions to logic and science, as did his contemporary Simplicius.

The Alexandrian iatrosophists of late antiquity selected a canon of perhaps 16 Galenic writings to be read in schools, to be summarized, and to be commented upon. The first four treatises in the canon were *On Sects for Beginners*, *The Medical Art*, *On the Pulse for Beginners*, and *To Glaucon on the Method of Healing*. For the most part, the Alexandrians' selection and sequence do not correspond to Galen's own propaedeutic recommendations, but they became a decisive step in the Alexandrians' scholastic transformation of the Galenic oeuvre into a medical system that was to dominate European and much of Arabic medicine for centuries.

Among numerous other Byzantine writers who drew extensively on Galen, whether directly or indirectly, are Stephanos of Athens (who wrote a commentary on Galen's *To Glaucon on the Method of Healing*), Meletios the Monk, Theophilos Protospatharios, and John (Zacharias) Aktouarios.

A rare Byzantine attempt at refuting Galen occurs in a treatise by the 11th-century scientist Symeon Seth, who was equally familiar with Greek and Arabic traditions. Tensions between Aristotelians and Galenists grew as Aristotle and Galen came to be recognized as the two greatest representatives of a science rooted in logic and in systematic philosophy. Numerous translations, summaries, commentaries on Galen's treatises, and adaptations of his work in a variety of languages (e.g. Latin, Syriac, Arabic, and Hebrew) attest to his stature both in the East and in the West. Even when his authority began to be challenged, especially after the resumption of systematic human dissection in the early modern period, Galenism remained a powerful force in European medical thought for several centuries.

Biography

Born in Pergamum in AD 129, Galen was the son of an architect. He studied rhetoric and philosophy in Pergamum before turning to medicine. After further study in Smyrna and Alexandria he returned to Pergamum in 157 and went to Rome in 162. Returning to Asia Minor in 166, he was recalled by Marcus Aurelius in 169 and remained in imperial service until his death in 208 or 216. He was a prolific writer on all aspects of medicine; more than 170 surviving works are attributed to him.

Writings

Opera Omnia, edited by Karl Gottlob Kühn, 20 vols, Leipzig, 1821–33; reprinted Hildesheim: Olms, 1964–65 (the most recent reasonably complete modern edition)

On the Natural Faculties, translated by Arthur John Brock, London: Heinemann, 1916

On Anatomical Procedures, translated by Charles Singer, London and New York: Oxford University Press, 1956

On the Usefulness of the Parts of the Body, translated by Margaret Tallmadge May, 2 vols, Ithaca, New York: Cornell University Press, 1968 (includes commentary)

Three Treatises on the Nature of Science, translated by Michael Frede and Richard Walzer, Indianapolis: Hackett, 1985

On the Therapeutic Method, books 1–2, translated by R.J. Hankinson, Oxford: Clarendon Press, and New York: Oxford University Press, 1991 (includes commentary)

Selected Works, translated by P.N. Singer, Oxford and New York: Oxford University Press, 1997 (with a useful bibliography)

Games and Sports

Influenced by the Minoans, and possibly also by the Egyptians, the Mycenaeans almost certainly engaged in athletic activities. Myth suggests the purposes as honouring a god (e.g. Zeus at the Olympic Games) or a dead hero (e.g. Patroclus' funeral games in book 23 of the *Iliad*) or just as entertainment (e.g. the Phaeacian games in book 8 of the *Odyssey*). By the classical period they were both an essential part of the school curriculum for boys and a pursuit for youths and men of all classes at the public gymnasia and the private palaestrae. The Greek attitude to them is most succinctly encapsulated in the famous phrase of Juvenal (10. 356), *mens sana in corpore sano* (a healthy mind in a healthy body), which does not, however, come from an athletic context. Alexander the Great's subjugation of the Near East in the 4th century BC spread this attitude to non-Greeks, most surprisingly, perhaps, to young Jewish priests who in the 2nd century BC forsook their duties in the temple for the delights of the discus (2 Maccabees, 4. 7–17). Even 300 years after Alexander's more evanescent conquests deeper into Asia, an Indian prince was throwing the discus and the javelin in an especially laid-out area of his palace. Athletic sports did not, however, have much appeal to the Romans, whose gladiatorial atrocities were in turn generally despised by the Greeks.

Although girls, especially in Sparta, participated in some athletic events including on occasion even wrestling, adult women were denied the opportunity. From the 6th century BC all males (except in equestrian events) competed naked, their bodies, to prevent dirt entering the pores, covered in olive oil which was later scraped off with a strigil. Homer describes chariot racing, boxing, wrestling, running, an armed joust, the throwing of a stone and of a piece of metal, and archery. In the classical period the events that comprised the competitions at the public games fell into four groups: running, the pentathlon, fighting, and equestrian events.

Apart from relay races with a torch for a baton, which were rather part of religious cult than athletically competitive, there were four running-races: the *stade* and the race in armour were one length of the stadium and the *diaulos* two, while the *dolichos* was a long-distance race. As the lengths of stadia differed, so did those of these races, but they approximated to a furlong (200 m), a quarter of a mile (400 m), and three miles (4.8 km) (the marathon is a modern commemoration of Phidippides' run from Marathon to Athens to announce the victory over the Persians in 490 BC). The *stade*, the original event in the Olympics, traditionally founded in 776 BC, carried the most prestige. In all races runners first started, at the sound of a trumpet, from a *gramme* (scratch-mark) in the sand, but in the 6th century BC this was replaced by a *balbis* (stone sill) with grooves for the toes, to which was added in the 5th century a *husplex* (starting gate). This last was operated by a man behind the runners releasing simultaneously cords which were attached to horizontal bars on vertical posts in front of each runner (the remains at Isthmia provide the best archaeological evidence). Turning-posts were used in the *diaulos* and *dolichos*, but it is not known if each runner had his own post or if, more likely, they all turned round the same post. There was no finishing-tape, and if the judges could not distinguish a winner a rerun was held. Heats were used when more than the 16–20 runners that the varying widths of stadia could accommodate competed.

The pentathlon, first devised probably for the Olympic Games of 708 BC, comprised five activities: a jump, a discus throw, a javelin throw, a *stade* race, and wrestling, for the first three of which there were no separate competitions. The winner was the first athlete to win three events: running and wrestling presumably took place only if no clear winner had already been determined. Despite the pentathlon's popularity on vase-paintings, Plato's comment (*Amatores* 135e) that it was the opportunity for the second-rate athlete, and the small prizes for winners known from the Hellenistic period, suggest that it ranked low in prestige.

The jump was performed to the sound of pipes as a rhythmic aid by athletes who held *halteres* (jumping-weights) of 1.8 to 3.6 kg in their hands. Since the only three recorded distances are between 15 and 17 m, the jump is most likely to have been a multiple jump, perhaps the modern hop-step-and-jump or triple jump which was introduced as an interpretation of the ancient event. Aristotle claims (*De Incessu Animalius* 705a17) that the athletes jumped further with *halteres*, and modern athletes have found that weights can improve distance in the long jump (and, if they are released, even in the high jump), but it is difficult to see how this could be possible in a multiple jump unless they were released in the first segment. The evidence of both literature and vase-painting, however, points unanimously to their retention.

The discus was usually made of bronze in the Classical period. Surviving examples vary in diameter from 16 to 34 cm and in weight from 1.3 to 6.8 kg. Although the athlete threw forwards from an area demarcated in front and at the sides, and could consequently make a preliminary run, he is unlikely to have done this. Vase-paintings and sculptures show reversed feet, probably indicating at least a partial turn of the body, and a rope-like pull with the right arm. The only recorded throw is of 29 m.

The javelin was generally made of cornel wood tipped with bronze. It was thrown, after a run, by an athlete holding it roughly horizontal above his head, with a thong wrapped round the shaft and looped over the first or first two fingers of the throwing hand. This perhaps gave added leverage, but certainly enabled the javelin to spin on its own axis, thus being steadier in flight and, in its military equivalent, boring into its target like a bullet. It had at least to nick the ground on landing.

The three fighting events were wrestling, boxing, and the *pankration* with no weight divisions, rings, or rounds. Judges attended the fights and beat with canes those who infringed the rules. The longevity of some fighters was remarkable: Milon, a boxer from Croton in the 6th century, must have been a cham-

Games: terracotta figures playing knucklebone, *c.*340-330 BC, from southern Italy, British Museum, London

pion for at least 21 years since he won six Pythian crowns (and five Olympic). Weightlifting must largely be considered as a form of training for these fighting events rather than as a sport in its own right.

Wrestlers, who had to make their opponents' shoulders touch the ground three times in order to win, were not allowed any leg-holds, although their legs could be used to sweep opponents off the ground. Vase-paintings and sculptures show numerous holds, upon which the modern Graeco-Roman style is based.

The aim of the boxer was to incapacitate his opponent (there are only two recorded deaths, both the result of fouls), or to force him to submit by raising an index finger. As was probably the case in Minoan boxing, the head was the sole target, and vase-paintings frequently show boxers (always right-handed) with head held back and chest thrust forward. In the 1st century AD a remarkable athlete from Caria named Melancomas displayed a completely different technique by skipping out of the way of his more ponderous opponents until they gave up in exhaustion. He is reputed never to have been hit and to have engaged in one bout that lasted two days. In training, shadow boxing was practised and fighters wore earguards and, to avoid hurting each other excessively, padded gloves, but in competition they bound *himantes* (thongs) round the knuckles for self-protection: the nickname *murmekes* (ants), applied to these *himantes*, indicates how they stung .

The *pankration*, which had the same aim as boxing, was a fight in which everything was allowed except gouging and biting. To judge from the number of poems commissioned from Pindar by pankratiasts and the magnitude of Hellenistic prizes, this was an event which both carried considerable prestige and appealed to the upper class.

Chariot-racing was for aristocrats, owners rather than competitors receiving the prizes. Despite the pride of place given to it by Homer, it did not feature in the Olympic Games until the 25th celebration in 680 BC. Light chariots were pulled by teams of two or four horses, or two mules or two foals, completing up to 12 laps between two markers. Hippodromes varied enormously in size from about 275 m to one in Athens that allowed a race of about 1.6 km without a turn. At Olympia the track was about 550 m long, and at the sound of a trumpet a rope barrier across stalls set in a convex line was removed in such a way as to give all teams a fair start, each driver having a flying start on his inside rival. Over 40 teams

are known to have taken part in a single race. Bareback riding was far less popular, but appeared at Olympia as early as 648 BC.

Although not recommended by medical practitioners, most Greeks could swim according to Herodotus (8. 89), who attributes the large number of survivors from the Battle of Salamis in 480 BC to this fact. The 6th-century Sicilian Olympic boxer Tisander used long-distance swimming for training. References are found to both breaststroke and front crawl, while beginners had the help of cork lifebelts and a fresco of the 5th century BC from Paestum shows a youth diving from what appears to be a diving-tower. There is literary evidence for occasional swimming races, while regattas for rowing were certainly held in the Imperial period.

Ball games were apparently aimed at healthy exercise (in the 2nd century AD Galen, in his *De Parvae Pilae Exercitu*, is particularly enthusiastic) and pleasure rather than serious competition, but they were important enough to form the subject of a lost treatise by the Laconian Timocrates (Athenaeus, 1. 15c). Homer describes Nausicaa and her attendants throwing a ball to each other, a late archaic bas-relief from Athens depicts what looks like a bully-off in hockey between two players while others with curved sticks look on, another bas-relief shows a throw-in in a team game, a black-figure vase shows a game in which an old man leaning on a stick is throwing a ball to three pairs of youths piggyback in front of him, a 5th-century relief has a youth bouncing (or balancing) a ball on his thigh (Spartan youths in the Roman period played a ball game with teams of 14 a side), and in the 2nd century AD Pollux describes (9.4) the game of *episkuros* that sounds a little like rugby football without any kicking.

Other games included hoop bowling (for youths as well as children), marbles, and, for the more sedentary, dice, knucklebones, and draughts, which last was played on a board of 36 squares with a "sacred line" down the centre to separate home from enemy territory. The most frequently mentioned game is *kottabos*, in which inebriated symposiasts, while reclining on their left elbows, threw with their right hands the last drops from their wine cups at varied targets such as saucers floating in water and objects that could fall when struck.

In Byzantium sport suffered from its pagan associations and Christianity's contempt for mundane activities. The most popular spectator sport was chariot-racing, but its style and organization of factions were Roman rather than Greek. With the waning of Roman influence it survived after the 7th century only in Constantinople and even there only as a part of imperial ceremonial. A total of 66 days' racing a year with about 24 races a day in the 5th century dropped to fewer than 12 days of only eight races by the 10th century and after 1204 the sport disappeared completely. It was to some degree supplanted by *tzykanion*, a Persian version of polo that resembled mounted lacrosse. It was introduced as early as the 5th century AD by Theodosius II, but was popularized in the 10th century by the Armenian-born John I Tzimiskes, and was the cause of a fatal injury to John I Komnenos Axouch at Trebizond in 1238. As military training John Tzimiskes introduced one cavalry game in which a horseman had to avoid or catch the blunted javelins of four opponents, and another in which galloping horsemen shot arrows at hats that they had hurled into the air (these games survive in Georgia as *isindi* and *kabakhi* respectively). Western influence brought to Constantinople the *tournemen* and the *dzoustra*, the massed tourney and the individual joust. Horsemanship was displayed also by aristocrats in the hunting of boar, bears, and deer both in the wild and, especially from the 10th century, in imperial game parks. The principal weapon was the spear, while dogs and even cheetahs were trained for the hunt. Most popular among smaller game were hares and quails. Fowling was always a method of supplying the table, but falconry became an aristocratic enthusiasm chiefly under the Komnenoi.

Although under Christian influence gladiatorial combat ceased in the 4th century, canon law did allow wrestling, boxing, running, jumping, and discus throwing. Archery was primarily for military training, while juggling and gymnastics were spectator sports in the hippodrome. Board games were frowned upon by the Church both for the associated gambling and the role of *Tyche* (chance). Dice, knucklebones, and chequers were, however, all known and Alexios I (1081–1157) played chess with members of his family.

As in most of the rest of the modern world, the favourite team sport of Greeks today is association football (soccer), in which their national and leading club sides enjoy fanatical support and have occasionally beaten more powerful sides without having ever won any European or world competitions (Greece did reach the finals of the World Cup in 1994, although it was well beaten in all its three matches in the first round). Basketball and volleyball come next in popular support. Most international success has been won in the individual sports of wrestling and weightlifting, which only in part explains the preponderance of successful male rather than female Greek athletes. In one sport Greece has enjoyed a fame quite out of proportion to its importance in the country. After Corfu was declared a British protectorate at the Congress of Vienna in 1815, soldiers of the British garrison played cricket on the Esplanade (until recently merely gravel), and in 1855 the first two local clubs of Greeks rather than expatriates began to play the game with a unique medley of Greek, English, and Italian terminology: official recognition came 140 years later when the International Cricket Council granted Greece affiliate membership. The most distinctive Greek game today, however, must be *tavli* (a form of backgammon): the clatter of its counters is the instantly recognizable sound of every *kafeneion*.

Greece's sporting legacy to the modern world is incalculable. Its emphasis upon athletic activity for young and old was a major impetus during the 19th century, first in England and thence elsewhere, in the introduction of sport into the educational curriculum and its acceptance as a respectable activity for adults of all classes. The modern Olympic Games are the abiding memorial of the Greek devotion to athletics.

Gardens

Finds of plant pots of clay or faience with holes at the base attest to the cultivation of flowers or herbs in the Aegean area in the 2nd millennium BC. The art of the Mycenaeans shows a persistence of floral motifs which is probably due to the non-Greek but associated and culturally influential Minoans, in whose frescos, glyptic art, metalwork, and painted pottery floral landscapes figure prominently. Although there is as yet no evidence that the Mycenaeans actually cultivated pleasure gardens, it is probable that the Minoans, under Egyptian inspiration, may have done so. A restored fresco of the Middle to Late Minoan period from a villa at Amnisos northeast of Knossos appears to show lilies arranged in a formal setting reminiscent of a garden. Excavation suggests the possibility of terraced gardens leading off porticoes in some Minoan palaces. At Phaestus in central Crete a rocky outcrop in the southeast area of the palace was not only cut back but also furnished with round holes, most likely once filled with soil and planted with flowers to create a tiny garden for the associated court and portico. The flowers in vases depicted in several frescos are, however, probably not growing but cut and wild.

The epics attributed to Homer, which frequently reflect the culture of the dark age rather than the preceding Mycenaean period, contain descriptions of gardens. Although these are mainly kitchen gardens and orchards providing grapes, olives, figs, apples, pears, pomegranates, and vegetables, there is also mention of groves associated with the shrines of gods and the graves of heroes. The almost lyrical delight in the beauties of nature shown in these poems is in sharp contrast to the harsh realities of practical agriculture in the roughly contemporary *Works and Days* of Hesiod.

Private gardens in the Classical period were again almost entirely utilitarian, even flower gardens having profit as their primary purpose in the sale of their produce for garlands. Unlike the situation in the Persian and the later Roman empires, horticulture and even agriculture were not considered gentlemanly pursuits in Greece. Urban houses were simple and small with no surrounding land but a central courtyard that rarely measured more than about 50 square metres, was usually paved, often contained a well and an altar, and served for many everyday domestic activities: it could have accommodated at best only a few potted herbs. The sole common private non-utilitarian gardens were the so-called Gardens of Adonis, but these were merely pots of fast-growing plants that died quickly and thus symbolized the life and death of the divine Adonis.

Public gardens in the Classical period were largely groves of trees (especially cypress, plane, and laurel) around shrines and were chosen for cultic reasons and to give shade. These sanctuaries sometimes also included stands of trees and fields of crops for commercial purposes. Two of the best-known groves were at the shrines of Aphrodite outside Athens and of Zeus and Aphrodite at Cyrene. The only one hitherto excavated surrounded the temple of Hephaestus in the Athenian Agora, but its date is as late as *c.*300 BC. Excavation of square pits dug into the bedrock indicates two straight rows of shrubs or small trees on three sides of the temple and small flowerbeds against the precinct wall. The pits contained deliberately broken pots used for the method of propagation known as layering by circumposition. Groves were planted also at gymnasia, which were themselves often associated with sanctuaries. Such is the origin of the schools of Plato and Aristotle, the Academy and Lyceum respectively, which set the pattern for later philosophical gardens, most notably that of Epicurus, which he left at his death to Athens as a public park.

The changes in the Hellenistic period are primarily due to two factors: the creation of new cities, most notably Alexandria in Egypt, enabled a more generous disposition of buildings with extensive open areas available for sanctuaries and public parks; and the substitution of autocracy for democracy or oligarchy encouraged rulers to spend public revenues on grandiose works that enhanced their prestige, these works including gardens in imitation of oriental monarchs. The most outrageous of these works was a ship designed by Archimedes in the 3rd century BC for Hieron II of Sicily that included a gymnasium with bowers of vines and numerous irrigated flowerbeds, while in the 2nd century Attalus III of Pergamum grew drugs on the deck of his flagship. Terrestrial parks often had artificial grottoes, fountains, sculptures, and an increasing range of plants, an interest attested by botanical treatises such as those of Theophrastus. Private homes, although often larger and more luxurious than earlier because of an increase in wealth, still tended not to include gardens, the central courtyard being often floored in mosaic.

Gardens in the Greek world under Roman rule were Roman in inspiration. The paved Greek courtyard became a peristyle garden with artistic fountains and formally arranged shrubs and flowerbeds. When space was cramped, roof gardens were created and walls were painted in the verisimilitude of gardens complete with birds. Grandees owned numerous villas that were single entities incorporating buildings, porticoes, terraces,

arbours, shrubberies, and flowerbeds and occasionally included even a game park. Landscaping, topiary work, sculptures, elaborate fountains, grottoes, and fish ponds all became regular features and garden dining rooms were not uncommon. All cities boasted public parks and temple gardens. Excavation, especially around the Bay of Naples, has revealed a vast amount of information.

The Byzantine Greek world shows a continuation of the Roman tradition, but precise information is hard to glean. Archaeology has hitherto unearthed virtually nothing. Frescos and mosaics in churches and manuscript illustrations, though frequently showing vegetation, do not provide a single picture devoted even primarily to a garden. The literary sources are very imprecise, while the most detailed descriptions, inserted for their sexual connotations in 12th-, 14th-, and 15th-century romances, are of imaginary (though not unrealistic) gardens. The single surviving treatise that deals with horticulture, the 10th-century *Geoponica*, is largely antiquarian, but does include some specifically Constantinopolitan information. Byzantine delight in gardens is nonetheless evident everywhere, churches being liberally adorned with vegetal decoration, manuscript illuminations frequently including flowers and trees (even when quite inappropriate, as in desert scenes), and literature being permeated with horticultural imagery. This delight was both inherited from the Romans and encouraged by a religion which emphasized the natural world as the work of God and saw the garden as a pale reflection of the heavenly paradise – it is no surprise that the monks of Mount Athos claim their peninsula to be "the garden of the Mother of God". Health was also a consideration: a house would be rendered salubrious by "the circumambient air since it is infected by the exhalations of the plants", while the emperor Theophilos (829–42) hoped that fresh air and lovely views would wash away "the baneful lusts" of former prostitutes. For emperors gardens were often a matter of prestige and associated with the symbolism of imperial renewal.

In the Late Antique period increasing barbarian incursions, especially in the western part of the empire, necessitated more defensible country villas and a corresponding decline in the number, size, and elaboration of their attached gardens. There is only meagre evidence for extensive examples after the 6th century AD except in the immediate vicinity of Constantinople. The gardens of villagers and monks were almost exclusively utilitarian. Market gardens supplied the cities with a wide range of vegetables and fruits which generally enabled the Byzantines to enjoy a healthier diet than did their western European counterparts (the produce was often transported over considerable distances). Urban houses of the middle class contained small gardens that could contain fruit and decorative trees: two descriptions of such a garden (his own) by the 10th-century writer John Geometres survive. Manuscript illuminations suggest also a fondness for roof gardens. Urban churches were frequently surrounded by gardens of shady trees, flowerbeds, and paths for the enjoyment of the general public. The most extensive and elaborate pleasure gardens were those associated with the palaces of the emperors and, to a lesser extent, of high court officials. Some of these were suburban, often by the sea, designed to combat the heat of the summer and sometimes connected with a game park, but the most important was undoubtedly the Great Palace in Constantinople. This was not a single building but an agglomeration, dating from the 4th to the 12th centuries, of residential quarters, public reception- and dining-rooms, churches, chapels, baths, pavilions, pleasure and vegetable gardens, an orchard, a fish pond, and sports grounds all set on terraces descending from the Hippodrome to the Sea of Marmara. The literary sources dwell on the lush vegetation of the gardens and especially on the highly elaborate fountains and a golden tree with mechanically warbling birds. The gardens described in the romances, based on palatial exemplars, emphasize also artwork in the form of statues or paintings and mosaics in pavilions and bath houses, water-driven automata in the form of birds and mammals on the fountains, and, above all, the sound of the wind whispering through the leaves of intertwining branches.

Among the trees and shrubs, both useful and ornamental, found in literary and visual sources are pine, fir, cypress, black and white poplar, alder, cedar, willow, tamarisk, oak, ash, elm, beech, plane, maple, bay, myrtle, mastich, terebinth, arbutus, box, juniper, olive, apple, pear, sorb, peach, apricot, citron, quince, damson, sloe, cherry, pomegranate, fig, date-palm, jujube, medlar, carob, mulberry, hazelnut, walnut, pistachio, sweet chestnut, and the ubiquitous vine which frequently festooned trellises. Orange and lemon appeared late. The range of flowers, because of the problems of irrigation, was far more restricted. Pride of place was taken by the rose, grown in rows, spiralling up trees, and in pots. Violet, narcissus, lily, crocus, pimpernel, and, for ground cover, periwinkle are also found, while ivy too was used for decorative effect. Herbs include basil, marjoram, savory, coriander, saffron, dill, rue, fenugreek, cress, mallow, mint, borage, costmary, squill, tarragon, parsley, cumin, smilax, salsify, mustard, and monk's rhubarb. Illustrated copies of Dioscurides' extensive medicinal herbal of the 1st century AD continued to be produced and used and were even sent as gifts to Muslim rulers.

Trees were planted individually, in clumps, in straight rows and crescents, and to create arbours; flowers in separate and mixed beds and often between trees to take advantage of their shade and water channels. Topiary work seems not to have followed the extravagances of its Roman inventors but to have been restricted to a few favourite configurations. Landscaping was vigorously pursued, since gardens were designed to be enjoyed not only from buildings but also by strollers who appreciated ever-changing vistas. Particularly enthusiastic as a landscape designer was Constantine IX Monomachos (1042–55), whom Michael Psellos gently mocks for impatience and changes of mind in mid-course. Horticultural experiments in grafting, improving colour and fragrance, and enabling flowers to bloom out of season were laudable occupations of the upper class.

During the Tourkokratia Greek gardens, both private and monastic, were largely utilitarian, although arbours of vines and pots of fragrant herbs such as basil had an added aesthetic function. Since independence no distinctive Greek style has emerged. Towns and cities usually contain small and formal squares with shady avenues and sometimes geometric parterres. The Esplanade in Corfu is exceptional, but its large size (*c.*550 × 230 m at its widest point) is due to its origin as a Venetian parade-ground: it is unique too in Greece in that its northern part constitutes the famous and, until recently, grav-

elled cricket "field". Among palatial gardens that at Tatoï, outside the capital, is noteworthy in that the afforestation in unpromising soil is a scientific triumph. Although from 1836 queen Amalia designed the Royal Gardens (now known as the National Garden) in Athens, the few interesting gardens in Greece have been designed by foreigners, mostly British. Thomas Mawson was responsible for the initial landscaping in Athens on the Acropolis, Lykabettus, and the Philopappos Hill (his other plans for urban parks and royal gardens were unfortunately never carried out); Robert and Marina Adams between 1965 and 1982 encouraged the integration of gardens into the Greek landscape by the use of native materials. In more recent years Greek landscape-architects have done some good work, although they have been hampered by the lack of any modern gardening tradition beyond that of basic skills.

Gatsos, Nikos 1916–1995

Poet and translator

Regarded as a great innovator and an inventive revolutionary wit, Nikos Gatsos was undeniably a legend before the facts of his life were established or his texts had been thoroughly edited. Gatsos was said to be an obscure, private, and bizarre poet, the hyper-realist before hyper-realism who demonstrated an extraordinary ability to move freely between a hyper-realism that shrank from no sort of sordidness and a surrealism that was not to become a programme until half a century later. Gatsos was the erudite mind who, more than anyone else, clung to the inexhaustible stock of the Hellenic literary tradition and attempted to reinvigorate it by blowing on it the daring winds of European surrealism. In this way, he shed light on the hyper-realist elements of the Hellenic tradition that, although always present in it, had remained unknown, silent, and undiscovered. Thus Gatsos not only regenerated the Hellenic tradition and imparted a substantial knowledge to his own generation as well as the previous poetic generation but, most importantly, he was responsible for changing the momentum and transforming the course of modern Greek poetry.

Gatsos's poetic work includes only one collection published under the title *Amorgos* which circulated in two editions (1943 and 1964). Nevertheless, Gatsos composed a limited number of individual poems intended to be set to music as songs by famous Greek composers. He also translated dramatic texts and plays that were performed by numerous Greek theatrical companies. Among his most renowned translations were Federico García Lorca's *Blood Wedding*, and Tennessee Williams's *A Streetcar Named Desire* and *Something Cloudy, Something Clear*, through which he instilled his creative, original, and revolutionary ideas and transferred his poetic qualities to the modern Greek theatre. Thus he had an immense influence on the way of thinking of modern Greek dramatists, playwrights, and directors.

Gatsos was born in a village in Arcadia (Peloponnese) and attended the University of Athens where he completed his studies in Greek literature. Gatsos's dedication to poetry was never that of a potential professional writer or a man of letters. He was the poet who never encouraged a critic to delve into his poetry and analyse it or to approach him personally. This is evident from the limited amount of Greek critical bibliography relating to his work. After publishing just one collection, Gatsos never returned to poetry but instead he embarked on an enduring, extremely personal, intellectual, and philosophical adventure. It is no exaggeration to say that Gatsos's silence is comparable to that of Dionysios Solomos. This is because Gatsos never tried to be a prolific poet, but the real artist, able to communicate his presence and influence to a whole generation, to spell out his visions and truths, to enlighten the next generation through a single collection. Gatsos was able to maintain the delicate balance between the critical and the imaginative, idealistic elements in his poetry. When he sensed the balance tilting towards the critical element and his contemplative mind overtaking his visionary mood, he immediately denounced his art and suspended his writing.

Gatsos was destined to be compared in many respects with Andreas Kalvos. Although they made their appearance at different moments in time, both provided the Hellenic literary tradition with a large vision, a big idea. Although both were considered to be among the less productive of modern Greek poets they were able to renew the Hellenic tradition not by simply adopting external models but rather by incorporating the antithetical elements and uncovering new ones.

In evaluating the contextual framework of Gatsos's poetry and its overall effect, one could say that he derived his inspiration from the broader pantheon of Greek and European tradition and an amazing plethora of stimuli. By following in the

steps of Alexandros Papadiamantis, Takis Papatsonis, Georgios Sarandaris, Odysseos Elytis, and George Seferis, he sought a connection with European philosophical thought and literature.

The unique phenomenon of Gatsos was not a purely surrealistic one like that of Egonopoulos or Andreas Embirikos. Gatsos employed several hyper-realistic elements but always remained conscious of his cultural and ideological context. He was not only an expert of the Hellenic tradition but he also succeeded in sheltering it in his work and renovating it from within. He made the first consistent attempt to prove that the Greek tradition contained important hyper-realistic elements. He relied on the tradition without exploiting it, while at the same time he incorporated the whole of Western thought produced between the two World Wars. As a result Gatsos has proved to be a two-dimensional poet: both deeply Greek and deeply European.

Also remarkable is the number of ways in which the Hellenic tradition functioned in his verse. Gatsos could converse with the characters of folk songs, flirt with the rhythms of ancient Greek poetry, and, at the same time, call upon an epigrammatic adage from Heraclitus. Following the example of Max Jacob, he constructed a vision strong enough to be expressed through the most unpoetic, flat, and solid expressions.

Having devoured the works of T.S. Eliot, García Lorca, Kafka, Sartre, and Valéry, as well as Cavafy and Solomos, Gatsos responded to the history of world literature according to his own perception of it. He discovered the tradition in the chorus of ancient tragedy, the hymns of Byzantium, and the popular songs of his ancestors. In this way, he taught the robustness of the organic function of rhyme, the aesthetic and moral quality of the Greek language. Gatsos was an "alchemist of the word" and an inventor of "the colours of the vowels". Sometimes in his poetry an expert reader can detect the pure magic of freely floating images and sounds operating more powerfully than Gatsos's acute intelligence and unabashed eye. His imagery is always as daring and surrealistic as it is in popular songs or in the texts of Cretan theatre. It evokes the past without any hint of nostalgia and it fluctuates incessantly. His obsession was to use the right words in the right order in his verse. Like Solomos he was a perfectionist. He attempted to convey his thoughts through a synthesis of traditional sounds, odours, colours, and images.

Gatsos's concentration on the hyper-realistic element in the Hellenic tradition made possible his transition from poetry to song writing. His songs are complete, self-sufficient, and independent. They are like one-act plays and they enabled him to popularize traditional surrealism among the Greek public. He also showed an extraordinary talent for translation. All his translations are direct, pure, and lyrical. Moreover, either through his translation of theatrical plays or by his attempt to adapt the theatrical text to the needs of the staging, Gatsos exercised a profound influence over the dramatists and directors with whom he collaborated.

It is no accident that Gatsos's poetry – which first appeared in the year of the German occupation of Greece (1943) – became the landmark for a whole generation of poets and the standard against which the next generation rebelled. He influenced every single aspect of Greek intellectual and cultural life. He questioned all the conventional associations of poetry without neglecting the traditional element. Gatsos wanted to substitute a new meaning to all the things he saw – the Hellenic literary tradition as a whole – not as seen by human conventions but as they really are. His contribution is enormous since without him modern Greek poetry might have followed completely different directions.

Biography

Born in Arcadia in 1916, Gatsos studied Greek literature at the University of Athens. He published only one collection of poetry, *Amorgos*, in two editions (1943 and 1964), though it became a landmark for a whole generation of poets. In addition he wrote songs and translated the plays of Lorca and Tennessee Williams. He died in Athens in 1995.

Gaza

City in Palestine

Gaza, on the route from Egypt to Palestine and situated a few kilometres from the sea, and its port, Maiuma, have a long history. Gaza appears in the Bible as a centre of the Philistines. Hellenization began after the city was captured by Alexander the Great in 332 BC. It was ruled by the Ptolemies, and destroyed by the Jewish ruler Alexander Jannaeus in 96 BC, only to be rebuilt by the Roman governor Gabinius on a new site. It received Roman settlers when it became a Roman colony in the reign of Hadrian, perhaps in AD 129. The city worshipped Greek gods, but these were probably Semitic deities whose names and cult had been Hellenized. This is clear in the case of Zeus Marnas, the principal god of the city. As late as 395 the majority of Gaza's inhabitants still adhered to paganism.

Mark the Deacon's account of how Bishop Porphyry with the support the empress Eudoxia and local imperial forces destroyed the Marneion and the other pagan temples in 402 and so inaugurated the conversion of the population to Christianity is remarkably vivid and informative. In the 5th

and 6th centuries, Gaza was an important centre of education with a succession of distinguished teachers representing a Christian humanism, combining traditional rhetoric with Alexandrian philosophy and study of the Bible. Procopius (*c.*465–528) wrote a panegyric of the emperor Anastasius, rhetorical descriptions of works of art, and commentaries on a number of books of the Bible. He was one of the creators of the genre of catenas. His pupil Choricius was a Sophist in the tradition of Libanius. Choricius' orations give a vivid impression of Gaza in the first half of the 6th century. The *Theophrastus* of Aeneas of Gaza describes how Theophrastus, a pupil of Aristotle, is forced to accept Christian arguments concerning immortality and the Resurrection. Dorotheus of Gaza (500–60) was the author of the influential *Didaskaliai* (Teachings) of monastic life which were to be translated into Syriac, Arabic, Georgian, and Church Slavonic. The city was captured by the Arabs in 635.

J.H.W.G. LIEBESCHUETZ

Summary

An ancient city on the coast of Palestine, Gaza was first Hellenized after its capture by Alexander the Great in 332 BC. Paganism prevailed until the end of the 4th century but conversion to Christianity was initiated in 402. In the 5th and 6th centuries it was an important centre of scholarship whose teachers included Procopius, Choricius, Aeneas, and Dorotheus. It fell to the Arabs in 635.

Gaza, Theodore *c.*1400–1475/76

Scholar

Theodore Gaza was one of the most prominent of the Byzantine émigré scholars who found refuge in Italy during the mid-15th century. In his activities as a teacher, translator, philosophical writer, and copyist of manuscripts, he helped not only to transmit classical Greek literature, especially the works of Aristotle and the ancient rhetoricians, to the Italian humanists but also to influence both their interpretation and their place in humanist education.

Throughout his career in Italy, Gaza was a popular teacher. He gave lessons in Greek to some of the foremost Italian scholars and humanists, including Ludovico Carbone, Ermalao Barbaro, the German astronomer Johannes Regiomontanus, and the Sicilian poet Antonio Beccadelli Panormita. Some insight into his teaching methods is given by his *Introduction to Greek Grammar*, which he wrote in the 1440s and which became the standard textbook for learning Greek. Erasmus regarded it as the best of the Greek grammars, and used it as the basis of his teaching at the University of Cambridge. In 1495 it was printed in Venice by the publisher Aldus Manutius and it remained in use well into the 16th century.

In his teaching Gaza laid stress on the Byzantine tradition of rhetoric drawn from the Greek orators of antiquity. In 1446, when he was appointed to the chair of Greek and Eloquence at the University of Ferrara, his first lecture series seems to have been on Demosthenes' oration *On the Crown*. His teaching of Greek rhetoric was undoubtedly helped by his mastery of Latin, a rare accomplishment among Byzantine scholars, which he had attained by studying under Vittorino da Feltre in Mantua between 1440 and 1446. Such was his proficiency that he was able to translate the orators Cicero and Claudian into Greek. Yet Gaza also appears to have believed, like his contemporary John Argyropoulos, that the whole of Greek Classical literature, and not only the rhetoricians, was worthy of study in humanist education. He used the occasion of his inaugural oration, entitled *On the Importance of Greek Studies*, to argue this point, stressing the role of Greek learning as a preparation for effective participation in political life.

It was, however, as a translator and paraphraser of Greek texts into Latin that Gaza was to make his name, especially in the work he produced in the years 1449–55 and 1464–73 when he resided in Rome, at the invitation of the humanist popes Nicholas V and Sixtus IV, and was one of the leading members of the Academy that met in the house of cardinal Bessarion. He produced Latin versions of Theophrastus' *On Plants*, Aristotle's *History of Animals* and *Problems*, and the pseudo-Aristotelian *Problems*, attributed to the Hellenistic commentator Alexander of Aphrodisias. He appears to have followed the method of translation adopted by Manuel Chrysoloras, abandoning a word-for-word rendering in favour of one that conveyed the spirit of the text. His translations were generally highly praised, but did not meet with universal approval; both Angelo Poliziano and George of Trebizond believed that his versions were too free.

In the process of translation, Gaza also made a significant contribution to the establishment of correct Greek texts: while translating the *History of Animals*, he noticed that in the

THEODORVS GAZA RHE,
TOR & GRAMMATICVS.

Fit tumulus: linguæ Gaza vtriusq; vocor.
THEO-

Theodore Gaza, a 16th-century engraving

manuscript tradition books 7 and 9 had been transposed and he realized that book 10 was spurious. Both these judgements are accepted today. He was also active in the copying of manuscripts, which in the mid-15th century was still the only means of reproducing a text. A number of manuscripts survive in his elegant hand, including a copy of Homer's *Iliad*, made for the Milanese humanist Francesco Filelfo, now in the Bibliotheca Medicea Laurenziana in Florence (MS 32.1).

Gaza's contribution to the interpretation of Aristotle had less immediate impact but was to be influential well beyond his own lifetime. In 1459 he wrote his *On Fate*, a treatise in defence of Aristotle against George Gemistos Plethon and other admirers of Plato. The work was notable for its conciliatory tone, in sharp contrast to that adopted by George of Trebizond, and for its attempt to reconcile the philosophies of Plato and Aristotle rather than to emphasize the differences in their teachings. However, *On Fate* was written not only against the rising tide of admiration for Plato but also against the late scholastic interpretations of his work, based on the 12th-century Arab commentator Ibn Rushd Averroes, which still held sway in many Italian universities. Instead Gaza referred to the interpretations to be found in the early Byzantine commentators Simplicius, John Philoponus, Themistius, and Alexander of Aphrodisias. His pupil, the Venetian Ermalao Barbaro, and others were converted to Gaza's belief that the truest interpretation of Aristotle was to be found in these writers rather than in Averroes, and, as a result, the Greek interpretation gained ground, especially in Venice. In 1497, some 20 years after Gaza's death, the Venetian senate appointed Nicholas Leonicus Tomaeus to lecture on the Greek text of Aristotle at Padua, an appointment sometimes seen as marking the eclipse of Averroism.

JONATHAN HARRIS

Biography

Born in Thessalonica *c.*1400, Gaza moved to Italy by 1440 where he taught Greek in Ferrara, Naples, and Rome. His pupils included some of the foremost scholars of the day – Ludovico Carbone, Ermalao Barbaro, and Johannes Regiomontanus. His *Introduction to Greek Grammar* became a standard textbook and his Latin translations of Aristotle and Theophrastus were highly praised. He died in Policastro (Calabria) in 1475/76.

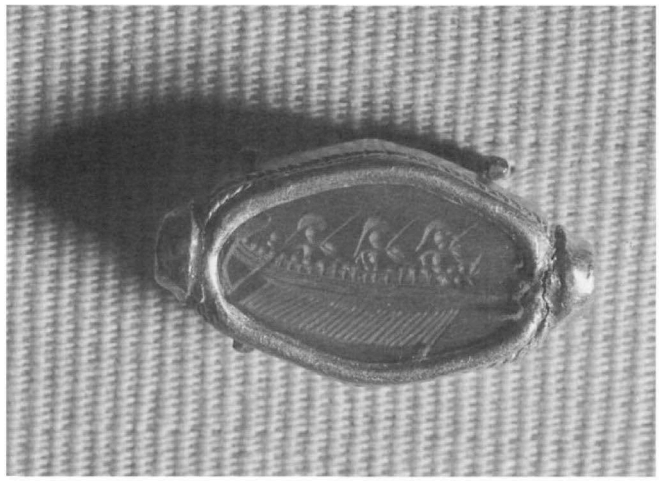
Gems and Seals

The use of seals fashioned from engraved semiprecious stones (normally cornelian and other quartzes) has a long history in Greek lands. Their primary purpose was to secure valuable commodities with a mark of ownership or to guarantee the authority of a letter or contract. They comprise much of the best miniature art produced during the Aegean Bronze Age and over a period stretching from Archaic Greece to Roman times, and were certainly valued for their artistry. Apart from the gems themselves, clay sealings survive from destroyed archives such as those of Hellenistic or early Roman date at Delos, Edfu, and Cyrene. Only from the 4th century AD did it become the custom in the Byzantine empire to affix to documents and



Gems and Seals: gem with a representation of a Greek warship, British Museum, London

packages double-sided sealings, normally of lead and made with a pincer-like *bulloterion*.

Seal motifs used in Cretan palaces of the 2nd millennium BC, such as Knossos, were generally engraved on one side of a pierced bead which could be worn on a string around the wrist or neck. Subjects comprise much of the standard repertoire of Minoan art, including marine creatures, bulls, and ritual scenes, such as the bull-leaping attractively rendered on an agate flattened cylinder (Ashmolean Museum, Oxford). Seals are quite common as finds and there are also many examples of sealings fired in various conflagrations, which attest to the highly organized and bureaucratic nature of Bronze Age society. The use of seals spread to mainland Greece, and fine examples are recorded from all the major sites, including Mycenae, Tiryns, and Pylos. The collapse of high culture, and with it the decline of literacy, at the end of the 2nd millennium BC brought the use of seals to an end.

From the 9th century BC there was a tentative revival of seal-cutting on the Greek mainland, though the stamp seals that were produced are rather schematically carved, on ivory or soft stone. In the 7th century BC seals of much higher aesthetic quality, often imitating Minoan prototypes, were engraved in the Cyclades. The major revival in gem-cutting came only in the second quarter of the 6th century BC when the Greeks adopted the Egyptian custom of carving seals in the form of scarab beetles. These were worn on a swivel-ring, and the devices engraved on the undersides of these archaic scarabs were thoroughly Greek in character from the start, sometimes orientalizing in style. Popular subjects include satyrs, warriors, lions, and winged figures such as the "mistress of the animals". From about 500 BC the use of the scarab back was largely abandoned and the devices on seals of scaraboid form became more naturalistic, as can be seen in the case of a gem signed by the engraver Epimenes showing an ephebe restraining a horse (Museum of Fine Arts, Boston).

Scaraboids of the 5th century BC are generally larger, and often made of a beautiful grey-blue chalcedony. Classical artists tried to imitate nature meticulously, whether the subject was a nut, a sandal, or an erotic scene. There are many delightful vignettes of animal life, including two studies of herons carved by Dexamenus of Chios (both in the Hermitage, St Petersburg). The same engraver carved a bearded male head (Museum of Fine Arts, Boston) and a delightful scene of a lady with her maid (Fitzwilliam Museum, Cambridge). During the Classical period the use of Greek-style seals spread in the western satrapies of the Persian empire and far beyond, many Graeco-Persian gems depicting figures in Persian costume and mounted hunts carved in an unmistakably Greek style.

Rings with fixed bezels became usual in the following century and were normal in Hellenistic and Roman times. From the time of Alexander the Great the Greek tradition of gem use was spread throughout the eastern Mediterranean area and, indeed, as far as India. A Hellenistic portrait of Alexander in the Ashmolean Museum, Oxford, bears an inscription in an Indian language. Moreover it is carved from tourmaline, demonstrating that rarer stones from the east were now available. The typical Hellenistic medium was perhaps garnet obtained from the western Himalayas. The changed nature of society is reflected in Hellenistic glyptics, many seals now showing the portraits of Ptolemies, Seleucids, and other rulers, although deities and genre scenes were always more common.

The incorporation of the Greek world into the Roman empire did not mark any real break with the Hellenistic tradition. The Greek style of gem usage had entered northern Italy as early as the Archaic period, and although the Etruscans and other peoples clung to the scarab back for longer, Greek influence from Magna Graecia and beyond continued to be felt, not least in Latium. By the beginning of the 2nd century BC important Romans were commissioning the best Greek engravers. The emperor Augustus (27 BC–AD 14) employed the great Dioscurides for his signet, as we hear from Suetonius, Pliny the Elder, and Dio Cassius. A number of gems from his hand are extant, including a Hermes (Fitzwilliam Museum, Cambridge) and Diomedes stealing the Palladium ftom Troy (Devonshire collection, Chatsworth).

Among the many gems from Greek-speaking lands in the empire, a special class of gems cut with figured devices and/or magical texts on both sides was widely distributed, especially in the Levant. These could be used in gems as seals but served mainly as amulets. Otherwise, while the occurrence of the Greek language or a Greek name on an inscribed seal indicates a Greek-speaking owner, the style and subject of "Roman" gems from Scotland to Syria are very similar, demonstrating the dominance of the Greek tradition in this medium.
